[1] Cf. the Masai word for donkey, *O-sibiria, I-sirkon.*
[2] Cf. the Kiswahili *Ndovu*, meaning an elephant.
[3] Obviously the same word in the three languages.

In Masai, Nandi, and *Mósiro* there are many alternative names for the animals listed above. Only one example of each has been given in order to save space. The *Aramanik* words given have no plural forms. It will be noted how similar are the methods of forming the plurals in Nandi and *Mósiro*. [193]

In the *Mósiro* tongue the use of the article is vague in the extreme, and it is often a matter of some difficulty to ascertain whether it is being used or not. However, I think it exists and that some individuals use it more or less habitually, but

2; Maguire C-5 (ca. 1926) 1927-28
FLÓ Dorobo FLÓ

192 the word seems to gain nothing from its inclusion or otherwise
197 and it would be difficult to lay down any rule about it.

The *Mósiro*, despite their laxity in the use of their own
193 article (assuming it to exist), are, curiously enough, surprisingly accurate in their use of the Masai article when speaking that language. (See p. xxii of the introduction to *The Suk; their Language and Folklore* (Beech). See also p. 52 of the text of that work.)

193 197 A COMPARISON BETWEEN SOME OF THE SIMPLER VERBAL FORMS IN MASAI, NANDI AND *MÓSIRO*

	Masai.	*Nandi.*	*Mósiro.*
I follow	A-suj nanu	A-'sup-i ane	A-mateŋ (ane') [1]

They followed	E-tu-suj-u-tuá	Ki-'sup *or* Ki-ko-'sup	Ara-ke-mateŋ

[1] May be, and often is, omitted.

The negative present of the Nandi verb "to know" as conjugated above is taken from Sir Charles Eliot's introduction to Sir Claud Hollis's *Masai Language and Folklore*. The spelling of the other Masai and Nandi tenses is derived from
127 Hollis's works on the Masai and Nandi. The examples of tenses in *Mósiro* given above (especially those without the pronouns) are submitted with diffidence. As I have said elsewhere, the *Mósiroi* is not a respecter of persons, and verbs seem to depend largely for their meaning on the context and on the conjoint pronoun. Very few *Mósiro* have any idea at all of conjugating a verb. The effort to reduce the *Mósiro* tenses to some form of lucidity entailed more work than I should
128 have believed possible. The results are submitted for what they may be worth—I cannot vouch for their accuracy.

[2] Or I-tu-suj-u-tuá?

3:Huntingford E-S (1921-1928)1929 FLA Dorobo FLA

Nouns in Dorobo and Nandi have two forms for the singular and two for the plural, *i.e.* a primary form, as *mosyon*, [a] warrior, and *masyon-ot*, [the] warrior; the characteristic letters of the secondary suffix are, sing., -*t* (-*d*); pl., -*k*. Words of both language are usually given in the secondary form; primary forms are distinguished by an asterisk, thus: *sopiko**. When the Dorobo use a Nandi word, or when the true Dorobo is the same as Nandi, the words are marked by the letter N following. Masai words are marked thus: † (*ingerait*†).

References.—H.M. = Sir A. C. Hollis, *The Masai*; H.N. = Sir A. C. Hollis, *The Nandi*.

I.—General Remarks on the Dorobo Tribes: Their Origin and History.

The people who form the subject of this paper occupy the forest area north of Timboroa hill, above Molosoni station on the Kenya and Uganda Railway, between lat. 0° 5′ S. and 0° 10′ N., and long. 35° 20′ E. and 35° 35′ E., the country that the Nandi call Kipchepkendi and Kimalilo (*see* Text-fig. 1). The Dorobo call themselves Okiek, pl. Okiek (fem. Chep-okiek, pl. Chep-okiek), by which name they are known to the Nandi. By the Masai they are called Ol-Torróbôni, pl. Il-Torróbo (fem. En-Dorróbôni, pl. In-Dorróbo). From the latter form is derived the name by which they are generally known, Wandorobo. The meaning of the name Okiek (stem Okí-) is unknown; the Masai name Torróbo may possibly be derived from the adjective *dorop* (pl. *doropo*) (short), in allusion to the short stature of the Dorobo (*see below*, "Physical Features"), though Hollis (*The Masai*, p. 28, n. 2) thinks that it is not. Since the word Okiek is not perhaps as well known as Dorobo, I have used the latter throughout this paper.

People calling themselves Okiek are found in various parts of Kenya Colony, in forest regions. A list of the sections[1] of the Dorobo is given by Mr. C. W. Hobley in *Man*, 1905, 31, together with a short vocabulary of three Dorobo dialects. In a note to the same paper, Mr. Hobley adds a list of 48 words of the language of a section called "El Mogogodo," who live near the E-Unano Ngiro, and who are thought to be Dorobo. Whatever the origin of the vocabulary of the other Dorobo language may be, their structure is certainly Nandi; the "El Mogogodo" vocabulary, on the other hand, is apparently a mixture from various sources, among which I can trace Masai, Nandi, Turkana and Nilotic (Dho-Luo) words. The presumption is, therefore, that the "El Mogogodo" are not true Dorobo. The earliest account of the Dorobo seems to be that of the Rev. J. L. Krapf, who wrote in the introduction to his *Vocabulary of the Enguduk Eloikob* (1854) that "the Wandorobbo are poor people, eating anything they may obtain: they eat the meat of the elephant, and of all other game. They cover their huts with dry grass, not with skins, as the

[1] Not "clans," as Mr. Hobley calls them.

):Huntingford E-S (1921-1928)1929 FLA Dorobo FLA

VI.—Language.

197 The language of the Dorobo is in structure a dialect of Nandi, which belongs, in point of development, to a stage between the Elgon dialects (Kony, Sapei, etc.) and Kipsikis (or Lumbwa). While many of the words are either (i) more or less the same as in Nandi, or (ii) the same as in other dialects of Nandi, a number of words do not belong to the Nandi group at all, nor have I been able to trace them in other languages; the assumption is that they represent the remains of the original Dorobo language. Masai (especially Uasin Gishu) has also contributed to the vocabulary.

Grammar.

• 193 *Letters.*—The spelling is the same as that used in Sir A. C. Hollis's book. As in Nandi, *b* is often inclined to a *p*-sound: in such cases it is written *b*; *b* sometimes inclines to a *w*-sound. There is in some words a lateral *s*-sound, here written *sz*, for which Nandi has *s*; the lateral *ts*-sound which Hollis heard in Tsogoyiku appears here as *dz*[1]; I could hear no trace of the replacement of *p* by *s* which he also heard. (S.H., p. xxviii.)

[194] *Accent.*—The accent is equal on all syllables, as in Nandi.

Substantives.—As in Nandi, nouns have a primary form (without "definite article") and a secondary form (with "definite article").

The secondary suffix, or "definite article": (i) sing., -i, -ti, -ki, -ni, -ri; (ii) pl., -ik, -tik, -ik, -nik.

Formation of the plural.

The general rules for the formation of the plural are as follows:—

(i.)

When the sing. endings are -et, -(i)ot, the pl. ends in -es-ik:—

Singular.		Plural.		English.
Primary.	Secondary.	Primary.	Secondary.	
[illegible]	[illegible]	[illegible]	[illegible]	*bird*
[illegible]	[illegible]	[illegible]	[illegible]	*cloud*
[illegible]	[illegible]	[illegible]	[illegible]	*earthworm*

(ii.)

When the sing. endings are -it, -et, -ot, -(i)ot, the pl. ends in -i-ik:—

[illegible]	[illegible]	[illegible]	[illegible]	*buffalo*
[illegible]	[illegible]	[illegible]	[illegible]	*beast*
[illegible]	[illegible]	[illegible]	[illegible]	*spear*
[illegible]	[illegible]	[illegible]	[illegible]	*arrow*
[illegible]	[illegible]	[illegible]	[illegible]	*kidney*
[illegible]	[illegible]	[illegible]	[illegible]	*hair on*
[illegible]	[illegible]	[illegible]	[illegible]	*face map*

[1] Though occasionally *ss* is heard.

193

(iii.)

When the sing. ends in -et, the pl. may end in -da-isk :—

Singular.		Plural.		English.
Primary.	Secondary.	Primary.	Secondary.	
[illegible]	[illegible]	[illegible]	[illegible]	[illegible]

(iv.)

When the sing. ends in -et, -et, -it, or -ot, the pl. may end in -ek or -ik :—

[illegible]	[illegible]	[illegible]	[illegible]	[illegible]

(v.)

(a) When the sing. ends in -et, -a-et, -yuet, the pl. may end in -da-ik :—

[illegible]	[illegible]	[illegible]	[illegible]	[illegible]

(b) Sing. in -et may have pl. in -da-ek :—

[illegible]	[illegible]	[illegible]	[illegible]	[illegible]

(vi.)

When the sing. ends in -a-et, and, in one or two cases, -et, the pl. may be in -da-isk (-aa-usk) :—

[illegible]	[illegible]	[illegible]	[illegible]	*deformed person*
[illegible]	[illegible]	[illegible]	[illegible]	*thigh*
[illegible]	[illegible]	[illegible]	[illegible]	*country*

(vii.)

When the sing. ends in -et, the pl. is often in -ik (for -ei-ik) :—

[illegible]	[illegible]	[illegible]	[illegible]	[illegible]

[illegible] For kirsh-it.

3:Huntingford E-5 (1921-1928)1929 FL6 Dorobo FL6

(viii.)

● 193 The sing. in -et, -let, is sometimes followed by a pl. -ai-ik, as in Nandi :—

Singular.		Plural.		English.
Primary.	Secondary.	Primary.	Secondary.	
rotion	rotion-et	rotion-ai	rotion-ai-ik	*fore-arm*
wütut	wütut-let	wütut-ai	wütut-ai-ik	*tail, broom*

(ix.)

When the sing. ends in -ta, -to, -la, or -do, the pl. generally ends in -u-ek :—

rob	rob-ta	rob-u[1]	rob-uk[1]	*rain*
ai	ai-ta	ai-u	ai-uk	*calf of leg*
mulil	mulil-to	mulil-u	mulil-uk	*leopard*
mutalg	mutalg-da	mutalg-u	mutalg-uk	*cheek*
tutulg	tutulg-do	tutulg-u	tutulg-uk	*heel*

(x.)

The following, as in Nandi, are irregular :—

chil	chil-to	pürch	pü-k	*man*
tie	tiep-to	tip-in	tip-ik	*girl*
tuny	ti-ta	tich	tu-ka	*cow*
kolg	kolg-da	kolg-in[2]	kolg-ik	*eye*
tokoch	tokoi-ta[3]	tokôch	tokôch-ik	*face*
mil	mil-t	mo-o-tin-u	mo-o-tin-uk	*fire*
omit	om-dit	omit-ung	omit-ungik	*food*
mulk	mulk-to	mu-on	mu-in-ik	*skin*
kol	kol-do	kol-ion	kol-iek	*leg*
kwon	kwon-et	kwon-u	kwon-u-iek	*centre*
kät	kät-it	kot-u	kot-uk	*neck.*

Adjectives.—The pl. of adjectives is mostly formed by the suffix -ech or -ach, as in Kony :—

Bad, ya ; pl. yäch.
Black, tuiuh ; pl. tuen.
Cold, kaitit ; pl. koititech.
Dirty, samin ; pl. sominech.
Few, lgerinech.
ma-ti-a
Fierce, korom ; pl. koromech.
Good, mlyo ; pl. mlyach.
Hard, uiyuh ; pl. uiyuyech.
Heavy, nyigin ; pl. nyiginech.
High, long, koi ;-pl. koien.
Hot, purke ; pl. purkeech.
Large, ô ; pl echen.
Little, miniñg ; pl miñgechen.
Many, much, chañg.
Other, ake ; pl alak.
Red, pirir ; pl. pirirech.
Sick, mioni ; pl. miondos.
Unripe, tuon ; pl. tuonech.
White, lêl ; pl. lêlach.

[1] The pl. suffixes -u, -uk are shortened forms of -ung, -ungik.
[2] The Nandi plural is konyen (konyeh).
[3] For tokoch-ta, since both in Nandi and Dorobo, ch- before certain consonants becomes i- with great regularity.

3:Huntingford E.-5 (1921-1928)1929 FL6 Dorobo FL6

193

Pronouns.—(i.) Personal:—

Used absolutely.		Object: verbal suffix.	
Ano, *I*	Acheek, *we*	-an, *me*	-ech, *us*
Inye, *thou*	Akwek, *you*	-in, *thee*	-ak, *you*
Inendet, *he, she*	Icheket, *they*		

(ii.) Possessive, suffixed as in Nandi:—The same rules for the changing of letters apply:—

With the Singular.	With the Plural.	English.	With the Singular.	With the Plural.	English.
-aŷûn	-chûk	*my*	nenyûn	chechûk	*mine*
-ûguûg	-kuk	*thy*	nedguûg	chekuk	*thine*
-ayin	-chik	*his*	nenyin	chechik	*his*
-ayon	-chok	*our*	nenyon	chechok	*ours*
-ûgwûg	-kwok	*your*	nedgwûg	chekwok	*yours*
-ayuun	-chouk	*their*	nenyuun	chechouk	*theirs*

(iii.) Demonstrative, suffixed:—The same rules apply as in Nandi for the changing of letters with the use of these:—

Singular.	Plural.	English.
(1) ni, i	chu	*this, these*
(2) nin, in	chun	*that, those*
(3) no, o	cho	*this, these*
(4) non, on	chon	*that, those*

Nos. (3) and (4) are demonstratives of relative nearness.

(iv.) Demonstratives of place:—

Singular.	Plural.	English.
yu.	uli	*here*
yun	ulin	*there*

All demonstrative pronouns may be intensified by means of the suffix -to or -tok *e.g.* ni-tok (this very (one)); uli-tok (at this very place).

(v.) Relative:—Sing., ne; pl., che.

(vi.) Interrogative:—

Ata? ..	*How many?*	Ano? ..	*Where?*
Ne? ..	*What? What sort of?*	Ngô? ..	*Who?*
Auyon? ..	*When?*	Amu-ne? ..	*Why?*

3:Huntingford E-5 (1921-1928)1929 FL6 Dorobo FL6

802 *Numerals.*—These are the same as in Nandi:—

Akenge or akange ..	1	Taman	10
Oieñg	2	Taman ak akenge ..	11
Somok	3	Tiptem	20
Añgwan	4	Sosom	30
Mût	5	Artam	40
Lo	6	Konom	50
Tisap	7	Pokol	60
Sisiit	8	Pokol oieñg 100 (anything over 60)	
Sokol	9		

● 193 *Verbs.*—The conjugation of verbs is very similar to that in Nandi. The present has a suffix -e or -i; and a-stems change to o- in the present tense. The negative prefix is ma, me, mo. When the 1st and 2nd pers. sing. and pl. are used as the object, direct or indirect, they are suffixed to the verb:—

a-mach-in, *I want thee.*
i-mach-a, *thou wantest me.*
o-mach-ech, *you want us.*
a-mach-ak, *I want you.*

When the verb-stem begins with i, the i is omitted under the same conditions as in Nandi.

Terms of Address

The forms given in the foregoing lists are those of reference, used when speaking of a person. In some cases the form used when speaking to a person is the same as the form of reference; but in others there is a difference:

Reference: *imamet*	or mama Address: *mama* (m. s.)
	apulaiyo. (w. s.)
inguket	*akui*
macokor(et)	*macokoronni*
senget or *senge*	*senge*
mureriat	*mureriandanni*
manonotiot	*manonotiondonni*
sindet	*sindanni*
lakuet	*lakuanni* or *lakuennyon*

Other terms have the same form for both reference and address. In this list it will be noted that *mama* and *senge*, though strictly forms of address, are used by the Dorobo for forms of reference as well. The forms ending in *-ni* are vocative (i. e. the demonstrative pronoun *ni*, 'this', used as vocative). *Lakuennyon* means 'my child'.

[193]

Grouping of terms

In the following classification of terms, an asterisk * means terms used by both sexes, and (w) means terms used by women.

Macokor

Third ascending generation; father's father's father*, father's father's mother*, mother's father's father*, mother's mother's father*. Own generation: father's brother's son*, father's brother's daughter*, father's sister's son*, father's sister's daughter*. First descending generation: father's brother's children's children*, father's sister's children's children*.

9:Hobley G-5 (ca. 1900) 1903 FL6 Dorobo FL6

They are said to be very prolific, having families of eight to ten children, but the infant mortality is so extremely heavy that their numbers increase very slowly; this mortality is probably due to the cold, damp climate of the Mau Forests, which are at an altitude ranging from 7,000 to 9,000 feet. 163 165 [132] [133]

Their peace ceremony consists of cutting off a dog's ears, and the contracting parties then spatter one another with the blood. 728 [291]

They live principally on Colobus and other monkeys, which they shoot in the forest. At certain seasons, however, they go and hunt big game on the plains, known as the Rangata Nyuki; they wait till the grass is dry, and then burn it to facilitate their hunting. They use poisoned arrows for big game, and unpoisoned ones for monkeys, &c. They train dogs to assist in their hunting, and are very keen to get young dogs for the purpose. They told me that they first gave the dog certain medicine, and the animal could then track game. 224 [262] [411] [231]

They are very clever elephant hunters, and informed me that when they came across an elephant they went off and bathed and scrubbed themselves very carefully to remove all trace of the human scent, and that they were then able to approach a sleeping elephant and spear it with a poisoned dart. [515] [825]

They are most expert in the use of a firestick. The fire is produced in the ordinary way by the friction of one stick spun round vertically in a depression in another piece of wood, which is held firm between the bare feet of the operator; the lower piece of wood appeared to be the juniper of Mau. 372 [824]

A small vocabulary of their language is appended on the opposite page. They use the Nandi numerals. 197 199

The prefix "ki," and the suffixes "et," "it," and "ek," are, I think, brought in from the Nandi language, but most of the roots will be found to be quite distinct. Many of the tribe can only speak Nandi, and when collecting this vocabulary in many cases they appeared to have forgotten the Oggiek or Omotik word but gave the Nandi word, and had to consult among themselves and, as it were, hunt up the proper word. The language is thus evidently dropping into such disuse that it will probably become quite extinct in the near future. [93] [82]

C. W. HOBLEY.

2: Maguire G-5 (ca. 1926) 1927-28
FL6 Dorobo FL6

193 women and they ours. Now we live with our cattle like the Masai." This account is far from enlightening, and when Serkala states that the *Aramanik* live as Masai, I fancy he is 197 making too sweeping an assertion. Admittedly, the *Aramanik* 101 of Moipo live as Masai, and so do many *Aramanik* in the central areas of Tanganyika Masailand, but I suggest that the Dorobo living at the north end of Lake Eyasi and those on the Serenget' plain (north-west of the Ngorongoro localities), who live a purely bush life, are also *Aramanik*.[1] Lekite was positive in the assertion that all the Dorobo living as such in the northern areas of the Tanganyika Masai Reserve and, furthermore, all the Dorobo in the Kenya Masai Reserve,[2] are *Aramanik*. I have had no opportunity of testing the accuracy of this statement. However, I do not think it likely that there can be yet another type of Dorobo unknown to those individuals from whose information the present notes have been compiled. If my assumption be correct, I think it may well be that *Aramanik* and *Balaŋga* (the latter possibly under a different name) constitute the bulk of the Dorobo in Kenya, and that the Dorobo inhabitants of the northern areas of the Tanganyika Masai Reserve are almost all *Aramanik*.

226 The *Aramanik* at Moipo are not fishermen. They do not [262] eat fish, but they are very partial to the meat and fat of the hippopotamus.[3] They do little hunting nowadays and are, 224 both young men and elders, rapidly becoming indistinguishable 282 from the Masai. The *Aramanik* living further north (notably those to the west of the Rift Wall at Sanjan, Salei and Peiáya) live a bush life of hunting and honey-gathering and are not above shooting a Masai ox when the chance presents itself.[4] 181 They are extremely shy people and I have had little chance of 123 establishing contact with them.

● 194 The most remarkable thing about the *Aramanik* is their language. It is guttural in the extreme, and while there would 192 seem to be few of the characteristics of the Masai or *Mósiro* [177]

[161]

[1] See p. 131, *loc. cit.* The Dorobo seen by Sir Claud Hollis may, alternatively, have been *Aramanik*.

[2] About 4000 in number.

[3] I have been unable to discover a single individual among the Masai and the Dorobo of all kinds who does not regard the eating of fish as anathema.

[4] According to unauthenticated statements made by certain Masai.

2: Maguire G-5 (ca. 1926) 1927-28
FL6 Dorobo FL6

tongues to be observed in it, certain words would seem to have been borrowed from the Masai. There are certain other words which the *Mósiro* say the *Aramanik* have taken from them. The *Aramanik* say the reverse is the case. For instance, an ox, in the *Aramanik* tongue, is *kirigit*. The *Mósiro* call it *kirigi*.

Numbers of words in the *Aramanik* language have no plural form, and the language as a whole, to the ears of a very inexperienced amateur philologist, would seem to be more primitive than that of the *Mósiro*. Its most pronounced characteristic, perhaps, is the frequent occurrence of a half-sounded *k*—generally at the termination of a word. Again, the *Aramanik* numerals differ from the Masai up to three only. I have gone into this matter at some length, but all my *Aramanik* informants are unanimous in stating that there never were any words for numbers above three until the remainder were borrowed from the Masai. This does not altogether satisfy me.[1]

Investigation of the Dorobo living adjacent to the 'l-Oita, Purko and Ol-Oitokitok Masai would, doubtless, be productive of much interesting information. As I have already said, I think they are *Aramanik*, but I have little to advance in support of my theory.

As in the case of the *Il-Mósirŏ*, some *Aramanik* are stated to have been adopted, in their fathers' time, into various Masai clans—mainly the *'L-Aiser*.

The Masai smiths (*Il-Kunŏno*)[2] had a dialect of their own which was not generally understood by the Masai. However, it was universally agreed to be a bastard Masai, and the *Kunŏno* were never asserted to be anything but Masai. I do not think they can be identified with any of the types of Dorobo we have seen so far.

Il-Kitokorda ; Il-Kisangara[3]

It is unfortunate that I am able to say little or nothing about these peoples. Whether they are two distinct types of Dorobo

[1] See Merker: *Die Massai*, p. 237. I could discover no *Aramanik* who knew all the numerals here given, but as *Die Massai* was first published in 1904, presumably the list of numerals was obtained at least twenty-five years ago and probably more.

[2] Mainly drawn from the *Il-Kipuyŏni* family of the *Il-Mŏlelyan* clan (Hollis).

[3] The names here given are probably not the true names of these Dorobo.

2: Maguire G-5 (ca. 1926) 1927-28
FL6 Dorobo FL6

differs little from that used by the Masai and many Bantu tribes. This axe is, primarily, a tool and not a weapon. They also carry the usual Masai club, which they call *rungu*'.[1] This club is used indiscriminately as a throwing or hitting weapon. The Dorobo are excellent shots with it, but are more expert with the bow. The latter weapon they seem to venerate; they are for ever holding archery competitions among themselves, and it is no uncommon sight to see a Dorobo dreamily twanging the taut string of his bow (often little shorter than himself) and deriving obvious pleasure from the sound produced thereby.

A skin bag or bottle, of the usual Masai pattern, is used to bring home honey collected in the bush. The Dorobo carry this, when full (the same remark applies to any other load), by means of a strap of bark or leather round the forehead. The load hangs between the shoulder-blades in the usual Masai fashion.

The *Mósiro* and *Aramanik* Languages

(A comparative list of numerals, words and tenses, with the equivalents in Masai and Nandi.)

The following symbols or marks have been used to assist in the correct pronunciation of the numerals and the short lists of words and tenses given. They have also been used throughout the text. Most of them are used as in Hollis's well-known works on the Masai and Nandi.

The symbol ~ when superimposed denotes that the *ñg* occurring in the word has the same sound as the English *singer*. In cases where it does not appear the *g* is hard.

A diaeresis has its usual grammatical significance.

´ denotes that the letter beneath it is definitely accented.

¯ denotes a long open vowel. *ee* has been used in some words to denote an inimitable, long, drawling sound.

An elevated letter (as in *dalo*[2]) denotes that the letter in question is barely perceptibly sounded.

Where ^ appears over a vowel, it means that the latter has a

[1] This club is almost always made of the wood of a tree called by the Masai *Ol-oirien*. According to the authority quoted in Hollis, this tree is the wild olive (*Olea chrysophylla*). *Ol-oirien* may also mean the heart-wood of a tree (Hollis).

2: Maguire G-5 (ca. 1926) 1927-28
FL6 Dorobo FL6

very open but short sound. In the case of *shódahai*, the *ó* is so open as almost to sound like the *a* in the English *father*. 194

ˈ denotes that the vowel beneath it has a short, clipped sound. In *ilˈl*, the *l* is pronounced like the *a* in the English *fat*.

. beneath a letter means that it has a slurred sound. *p*, *b*, *v* and *w* in the Masai and *Mósiro* tongues are almost interchangeable.

With regard to the list of numerals given, the similarity between the Nandi, Suk and *Mósiro* words (up to 5) will be apparent at once. The Aramanik *one* and *two* are unlike anything else in the list, unless *kindei* can be said to resemble *akeŭge* or *epei*. 802 197

The Somali, Masai, Latuka and the two Dorobo words for six are all alike, but the *Mósiro* word for *seven* and the *Aramanik two* (as stated above) have no resemblance to any others in the several counts. Possibly the former may be a corruption of the Nandi *seven*.

Turning to the list of nouns; only the word for *ox* is the same, or practically so, in *Mósiro* and *Aramanik*. No other corresponding words would appear to have the least resemblance in these tongues (except *asíta* and *ajil*) or in Masai. However, the remarkable similarity between the *Mósiro* and the Nandi list will not fail to be noticed at once. 192 197

The names of the game animals, in the *Mósiro* language, would seem to have been borrowed from the Masai in some cases. There will also be observed a certain similarity between *Mósiro* and *Aramanik* in the word for *hartebeest*, and the word for *wildebeest* is obviously the same in all three tongues. The likeness between *Mósiro* and Nandi will here be noted again. [177]

Some of the simpler verbal forms from Masai and Nandi have been taken and the *Mósiro* equivalents inserted. The similarity between the last two is again manifest. It is to be regretted that I am unable to submit examples of the *Aramanik* verbal forms. These are extremely primitive and very difficult to write, and I hesitate to place on record the very hastily-written examples I have, so far, had the opportunity of obtaining. 192 197 198

It may be as well to mention that the *Mósiro* examples given herein were all written down before I had access to

2: Maguire G-5 (ca. 1926) 1927-28
FL6 Dorobo FL6

apparent, but the outstanding dissimilitude, curiously enough, would seem to me to be the variations in the several manners of speaking Kiswahili. The pronunciation of the Kwavi, once heard, is never forgotten. It is nasal and unmelodious, with invariable pauses after such words as "but" and "and." The Dorobo method is characteristically lazy. Syllables to which the full value could quite easily be given are slurred over for no apparent reason. *Kutapika* commonly becomes *Kuta'i'a*. *Faru* is often rendered *Faoo*—but this may be due to Wanguu influence.[1] The Kiswahili-speaking Masai is more correct and enterprising. He often acquires curious words and expressions, and by virtue of his volubility and his employment of peculiar constructions cannot be mistaken. The Arusha speaks like the Kwavi, but without the pervasive nasal quality.

It is hard to differentiate on paper, but in conversation with representatives of the tribes mentioned the average European ear will not fail to detect the differences after a little experience.

Note.—I regret very much that owing to my inability to read German I have not been able to refer fully to Merker's well-known work[2] on the Masai, which contains much useful and interesting matter concerning the Dorobo.

R. A. J. MAGUIRE.

[1] [*Faa* is sometimes heard in Kenya Colony. It is a well-known tendency in Kiswahili—somewhat exaggerated by the Akamba—to drop intervocalic consonants, especially *l* and *r*.—A. W.]

[2] Merker: *Die Masai* (Berlin, 1910).

3:Huntingford E-5 (1921-1928)1929 FL6 Dorobo FL6

my apprentices in the Nandi Industrial School at Kâpsabet; our friendly reception by this elusive people is therefore due to Arap Ngamîgam. We should like to make it clear that this paper is the result of a short *safari*, and intended as a preliminary study, not as a finished and complete account.

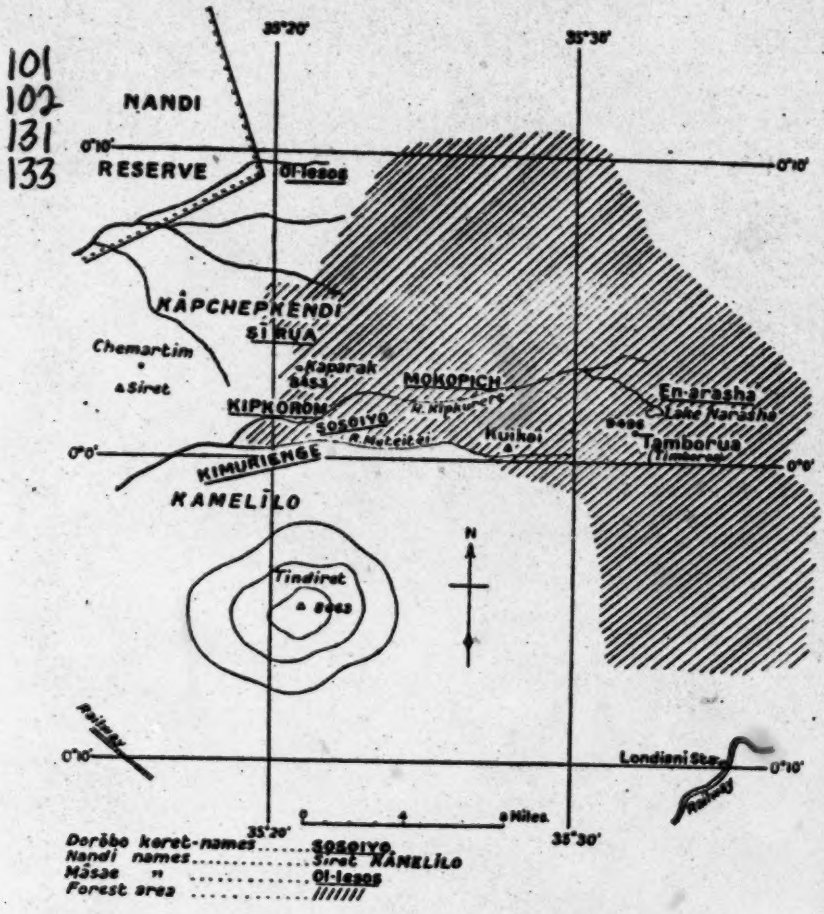

FIG. 1.—SKETCH-MAP OF THE KÂMELILO-KÂPCHEPKENDI DOROBO COUNTRY.

Both Nandi and Dorobo words are spelt according to the system adopted by Sir A. C. Hollis in his masterly work, *The Nandi*. It should be noted, in the words Okiot, Okiek (stem Oki-), that the k of the stem is semi-voiced, *i.e.* between k and g.

3:Huntingford E-5 (1921-1928)1929 FL6 Dorobo FL6

VI.—LANGUAGE.

197 The language of the Dorōbo is in structure a dialect of Nandi, which belongs, in point of development, to a stage between the Elgon dialects (Kony, Sapei, etc.) and Kipsikis (or Lumbwa). While many of the words are either (i) more or less the same as in Nandi, or (ii) the same as in other dialects of Nandi, a number of words do not belong to the Nandi group at all, nor have I been able to trace them in other languages; the assumption is that they represent the remains of the original Dorōbo language. Māsae (especially Uasin Gishu) has also contributed to the vocabulary.

Grammar.

193 *Letters.*—The spelling is the same as that used in Sir A. C. Hollis's book. As in Nandi, *k* is often inclined to a *g*-sound: in such cases it is written *k*; *b* sometimes inclines to a *w*-sound. There is in some words a broad *u*-sound, here written *uu*, for which Nandi has *u*; the broad *au*-sound which Hollis heard in Tanganyika appears here as *d*[1]; I could hear no trace of the replacement of *p* by *v* which he also heard. (N.H., p. xxviii.)

[194] *Accent.*—The accent is equal on all syllables, as in Nandi.

Substantives.—As in Nandi, nouns have a primary form (without "definite article") and a secondary form (with "definite article").

The secondary suffix, or "definite article": (i) sing., -t, -ta, -to, -da, -do; (ii) pl., -ek, -eik, -ik, -uek.

Formation of the plural.

The general rules for the formation of the plural are as follows:—

(i.)

When the sing. endings are -et, -(i)at, the pl. ends in -es-iek:—

Singular.		Plural.		English.
Primary.	Secondary.	Primary.	Secondary.	
kochong-o	kochong-et	kochong-s	kochong-es-iek	*hut*
toror	toror-et	toror-es	toror-es-iek	*road*
murer	murer-iat	murer-es	murer-es-iek	*sweetheart*

(ii.)

When the sing. endings are -it, -ot, -ut, -chot, the pl. ends in -is-iek:—

keb	keb-it	keb-is	keb-is-iek	*bullock*
oldau	oldau-it	oldau-is	oldau-is-iek	*heart*
olmorondoi	olmorondoi-t	olmorondoi-is	olmorondoi-is-iek	*spear*
asingai	asingai-t	asingai-ts	asingai-ts-iek	*necklace*

FLA Dorobo FLA

descendants of the hardier members of the Masai tribe, who were forced to adopt a life of hunting when supplies were short, as on the occasions when rinderpest swept through the Masai herds, leaving famine in its wake.

The changes from the original stock wrought by environment alone in many Western races are more marked than the differences to be observed between the *Balaágo* and their parent tribe. It may be said, in the case of the *Balaágo*, that environment would seem to have done its work with remarkable swiftness if any outward difference can be detected between the *Balaágo* and the Masai to-day, but is not Africa a country of mushroom growths?

Il-Kiyaláqat

The *Kiyaláqat* Dorobo would seem to be to the Kwavi or Lumbwa [1] Masai what the *Balaágo* is to the Masai proper. The Lumbwa, with the *Kiyaláqat*, live on the southern border of the Tanganyika Masai Reserve and in various small communities throughout the Dodoma, Kilosa and Handeni Districts. There are, also, Lumbwa in Usambara, east of the Pangani river. The Lumbwa state that the *Kiyaláqat* Dorobo originated in or near Morogoro, but as many *Kiyaláqat* are found wherever the Lumbwa live, I do not think this assertion can be relied on except inasmuch as it refers to the *Kiyaláqat* who sprang from that section of the Lumbwa which itself "originated" in Morogoro.

I have listened to the speech of the *Kiyaláqat* (who have no language but Masai),[2] and in it can be detected the typical characteristics which distinguish the pronunciation of the Lumbwa from that of the Masai proper. The *Kiyaláqat* call themselves Lumbwa,[3] live with the Lumbwa and move when they move. They have, as a general rule, small herds of

[1] *I-Okop.* The Lumbwa and the Masai proper are not friendly. Any account of their differences would be too lengthy to insert here, as the original cause of discord is of some antiquity. There were some small skirmishes between the Lumbwa and the Masai of adjoining areas during the late war. The Lumbwa are said to have assisted the Germans on many occasions to locate hidden Masai cattle. [2] See note 3, p. 131.

[3] Kwavi, rather, as the name "Lumbwa" is not in favour among the Kwavi, being a term of contempt applied to those who, pastoralists born, have adopted agricultural habits.

2: Maguire G-5 (ca. 1926) 1927-28
FL6 Dorobo FL6

of the following types of Dorobo.[1] I give the names in the singular and plural forms.[2]

Sing.	*Plur.*
1. Ol-Balafigai	Il-Balafiga
2. Ol-Kinyalafigati	Il-Kinyalafigat
3. Ol-Mósiroi	Il-Mósiro[3]
4. Ol-Médiaki	Il-Médiak
5. Ol-Kisankasai	Il-Kisankasa
6. Ol-Aramanik	Il-Aramanik
7. Ol-Kitokordai	Il-Kitokorda
8. Ol-Kisangara	Il-Kisangara

These names, all preceded by the Masai article, would seem to be the only ones known to the members of the types they represent. It is possible that there may have been other names in existence originally, and that many years in close contact with the Masai have had the effect of reducing some of these names to the Masai idiom. One [illegible] to give an opinion, owing to the complete lack of information on the subject.

The names of the types of Dorobo having been unearthed, it remained to establish contact with some individuals of each type. In this I have been moderately successful. An added incentive to my efforts was the fact that the *Mósiro* Dorobo, who live in considerable numbers in the vicinity of Talamai, were discovered to have a language of their own. This language is almost wholly unintelligible to the Masai. On being questioned, the *Mósiro* admitted their ability to converse in a tongue unknown to the Masai, but stated that there were other Dorobo[4] whose language they (the *Mósiro*) did not know.[5]

[1] I do not call them clans. I think it will be agreed, later, that their relationship is more distant than that between clans or families. On the other hand, it would not seem, from the existing evidence, that they can all be definitely labelled as distinct and different tribes.

[2] The singular would represent an individual of the type and the plural the type as a whole.

[3] According to Hollis, *Il-Mósiro* is the name given to a clan of the Chaga people by the Kenya Masai. I have not heard the name used in this connection by the Masai of the Tanganyika Reserve. [4] *Il-Aramanik*.

[5] [It might be of interest, in this connection, to recall the fact that the

2: Maguire G-5 (ca. 1926) 1927-28
FL6 Dorobo FL6

For the sake of brevity and clarity I have set forth the following notes under separate heads, each head being devoted to one type of Dorobo.

Il-Balaŋga

The *Balaŋga* Dorobo live mainly with the Masai. Some of them are poor, but many have acquired herds of cattle. A *Balaŋga* elder named Payána, living at present with the Masai of the Moipo area,[1] has one of the largest herds in the southern part of the Masai Reserve. The *Balaŋga* follow Masai customs and methods of life except when they are prevented from doing so through poverty. The acquisition of a few cattle immediately converts a *Balaŋga* Dorobo into a Masai, to all intents and purposes,[2] and his women have not that instinctive distaste for living among and sleeping in close proximity to cattle evinced by other Dorobo women. The *Balaŋga* have no language except Masai,[3] will tell you that they *are* Masai and are admitted by the Masai to be the same as they are themselves. Hence the less, it is interesting to note that the habituated eye can very often pick out the *Balaŋga* from an assemblage of Masai, particularly if the *Balaŋga* present be elders. The reason for this is, I think, that the privations these people have been forced to undergo in the past have left their mark. There is something *farouche* in the physiognomy of the *Balaŋga*, common to all natives who have, at one time or another, lived by hunting and away from their fellow-men.

In this connection it is of interest to note that Sir Claud Hollis, in an article in *Man* (December 1909), mentions the fact that he once met some Masai-Dorobo in the Rift Valley who did not speak Nandi (see p. 138 and other references *infra*). I think that the alternative theory advanced by him that

---

Wasanye, whose relation to the Galla resembles that of the Dorobo to the Masai, now all speak Galla, though they formerly had a language of their own (which some still remember), and, further, that the names of the Sanye clans are identical with those of Galla clans.—A.W.]

[1] The area bordering the Pangani river, north-west of Korogwe.

[2] Mr. F. J. Bagshawe, in a recent article in the *Journal of the African Society*, makes a passing reference to the *Balaŋga*, whom he considers to be merely impoverished Masai.

[3] Except Kiswahili, of course. A certain number of Masai in the Kilosa area speak this tongue, likewise many Dorobo.

2: Maguire G-5 (ca. 1926) 1927-28
FL6 Dorobo FL6 .

possibly these Dorobo had been poor Masai, who, having lost their cattle, had taken to hunting, is probably the correct one. It would appear likely that the Dorobo in question were *Balaŋga*, though Sir Claud was unable to satisfy himself as to their true origin.

The original *Balaŋga* are stated to have come from the Kisongo [1] district of the Masai. It may be that this is the case, as the name Kisongo originally stood for a very large tract of country—in fact, almost the whole area occupied to-day by the Masai of Tanganyika Territory. It is certain that there now are *Balaŋga* Dorobo with the Masai throughout the length and breadth of the Tanganyika Masai Reserve, and it becomes more difficult daily to find *Balaŋga* who still devote themselves to hunting. Even those who own little or no stock prefer to live with their richer brethren or with the Masai. The younger men have never led a bush life. They carry spears [2] (and, when appropriate, shields) and do not care to be reminded of the fact that they were ever other than the Masai.

Occasionally, when an elephant or other large beast is killed by the European sportsman, a few old men (Masai, to all outward seeming) will make their appearance unobtrusively, generally accompanied by donkeys. Having obtained permission, they will proceed to rip and hack away huge quantities of the flesh with a determination and cheerful abandon to be met with in the Masai. When the donkeys have been loaded with as much meat as they can carry, the old gentlemen will quietly depart, bound, presumably, for a banquet of Gargantuan proportions. Should one ask, they will admit shyly that they are *Balaŋga*, but will almost always add: "We are now Masai again."

I think there can be no doubt that the Masai and the *Balaŋga* are one and the same. The opinions of the Masai (notoriously unwilling to admit the equality of others) and the *Balaŋga* themselves are unanimous on the matter, and I have been unable to discover any shred of evidence to the contrary. It would appear reasonable to assume that the *Balaŋga* are the

[1] Cf. Hollis: *Masai Language and Folklore*; pp. 260, 261. The name would seem to be restricted, nowadays, to an area south-west and west of Arusha. (Map reference: B 5; Kilimanjaro: E, F, I, K.)

[2] The spear would not seem to be an indigenous Dorobo weapon.

2: Maguire G-5 (ca. 1926) 1927-28

descendants of the hardier members of the Masai tribe, who were forced to adopt a life of hunting when supplies were short, as on the occasions when rinderpest swept through the Masai herds, leaving famine in its wake.

The changes from the original stock wrought by environment alone in many Western races are more marked than the differences to be observed between the *Balañga* and their parent tribe. It may be said, in the case of the *Balañga*, that environment would seem to have done its work with remarkable swiftness if any outward difference can be detected between the *Balañga* and the Masai to-day, but is not Africa a country of mushroom growths?

Il-Kinyalañgat

The *Kinyalañgat* Dorobo would seem to be to the Kwavi or Lumbwa [1] Masai what the *Balañga* is to the Masai proper. The Lumbwa, with the *Kinyalañgat*, live on the southern border of the Tanganyika Masai Reserve and in various small communities throughout the Dodoma, Kilosa and Handeni Districts. There are, also, Lumbwa in Usambara, east of the Pangani river. The Lumbwa state that the *Kinyalañgat* Dorobo originated in or near Morogoro, but as many *Kinyalañgat* are found wherever the Lumbwa live, I do not think this assertion can be relied on except insomuch as it refers to the *Kinyalañgat* who sprang from that section of the Lumbwa which itself "originated" in Morogoro.

I have listened to the speech of the *Kinyalañgat* (who have no language but Masai),[2] and in it can be detected the typical characteristics which distinguish the pronunciation of the Lumbwa from that of the Masai proper. The *Kinyalañgat* call themselves Lumbwa,[3] live with the Lumbwa and move when they move. They have, as a general rule, small herds of

There were some small skirmishes between the Lumbwa and the Masai of adjoining areas during the late war. The Lumbwa are said to have assisted the Germans on many occasions to locate hidden Masai cattle.

[2] See note 3, p. 131.

[3] Kwavi, rather, as the name "Lumbwa" is not in favour among the Kwavi, being a term of contempt applied to those who, pastoralists born, have adopted agricultural habits.

2: Maguire G-5 (ca. 1926) 1927-28
FL6 Dorobo FL6

clans or families,[1] after the manner of the Masai, but there is no difference between their several bearers at the present time. *Mósiro* and *Méliak* Dorobo live and hunt together all over the southern half of the Masai Reserve to-day. They are fairly numerous[2] (for Dorobo), and in many cases are almost indistinguishable, outwardly, from the Masai.

There, however, the similarity ends, as these Dorobo (referred to, henceforward, as *Mósiro* collectively) are the first with whom we have had to deal possessing a language of their own. Reference to the comparative lists of numbers and the list of names of common objects given elsewhere will show the wide difference there is between the language spoken by these people and that of the Masai.

According to Lekite, who was the only man in recent years holding even a semblance of authority among these people, the "home" of the *Mósiro* is at Talamai.[3] He, in common with many Masai and Dorobo elders, admits that the Dorobo originally came from a country designated vaguely as *Juu*,[4] but no living *Mósiroi* can remember the time when the majority of his people did not live at or near to Talamai.

The *Mósiro* are to be found, occasionally, living with the Masai in the kraals of the latter. They are sometimes (particularly when game and honey are scarce) to be found in small rude kraals of their own, close to the Masai. In these kraals will sometimes be seen a few goats or sheep and almost always fowls.[5] More often, however, the *Mósiro* live in tiny communities (sometimes a man, his wife and their children alone) in the depths of the bush. There they exist, houseless save for a rude shelter of skins within a primitive thorn stockade, by hunting and gathering roots and honey. When supplies run short they beg from the Masai. When a large animal is shot or dies from natural causes the *Mósiro* in the vicinity seem to become aware of the event in the most uncanny way. They will appear unexpectedly, make their camp, and remain until the carcass has been completely denuded of flesh. The meat is not eaten quite raw, but is subjected to a hasty charring, the

[1] More probably the former.
[2] Possibly 1000 souls, including the women and children.
[3] See note 3, p. 127. [4] *Abous*: in this case meaning the north.
[5] The Masai regard the eating of fowls or eggs as unclean.

2: Maguire G-5 (ca. 1926) 1927-28
FL6 Dorobo FL6

be that their absence is in many cases due to poverty. The *Mósiro* women follow the unusual custom of the Masai women in shaving their heads.

The younger generation of the men ape the Masai in wearing pigtails and dress like them when they can. They are addicted to the use of *Ol-kária* [1] and will, in time, be absorbed by the Masai. A few of them are now working as herds for various Masai, and, as I have said before, others have begun to follow a pastoral life with their own small herds.

All the *Mósiro* speak Masai, but many of them do so very imperfectly. No Masai that I have met can speak the *Mósiro* tongue, though Masai who have come in contact with the Nandi tell me that the language spoken by the *Mósiro* to-day seems vaguely reminiscent of the Nandi speech. Reference to the lists of numbers given elsewhere will show the marked similarity there is between the numerals (up to five) in the Nandi, Suk and *Mósiro* tongues.

The language of the *Mósiro* is dying, as any language except Masai tends to do in the Masai country. I have asked many *Mósiro* to give me the names of various common objects, and I have often been given a Masai name, my informant protesting that he knew no other. In the case of the numerals, it would seem to be a moot point as to whether the *Mósiro* tongue originally possessed numerals up to seven only and borrowed the remainder from Masai, when usage demanded, or whether the numerals from eight onwards have fallen into disuse and have been replaced gradually by the Masai words.

The physical make-up of the *Mósiro* is good. They are, as a rule, tall and lithe and are in many cases more muscular than the Masai. The pigmentation of their skins varies from a light, clear brown to a black almost Nubian. There would seem to be differences between them and the Masai in the formation of the jaw-bone and the zygomatic arch. I have had neither instruments nor training to enable me to undertake a series of anthropometrical measurements, but I think it is safe to say that many *Mósiro* have high cheek-bones and

[1] A mixture of red ochre and mutton fat, smeared all over the body and patterned on the legs, arms and face. It seems to be in use among nearly all Nilotic tribes.

FL6 Dorobo FL6

IL-TORŌBO

PART II

Il-Aramanik

I must confess at the outset that the *Aramanik* Dorobo are the people from whom it was hoped to get the most interesting information and from whom I actually succeeded in extracting the least. They were first described to me as being a "clan" of Dorobo who lived at Moipo and who were fishermen[1] by occupation. This I have found to be quite incorrect.

There are *Aramanik* living with the Moipo Masai, but they live as Masai and have almost entirely abandoned Dorobo methods of life. They differ from the *Balaŋga* only inasmuch as they are not Masai, call themselves Dorobo and have a language of their own. This language (for examples of which see the section devoted to numerals and the list of common objects) is quite distinct from that of the *Mósiro*.[2] I have had personal experience of the fact that a Masai cannot converse with a Dorobo in the tongue of the latter, and that *Mósiro* and *Aramanik* can be quite unintelligible to each other.

An *Aramanik* named Serkala, of Moipo, gave me the following bald account of the origin of the *Aramanik*: "We come from Kigogo,[3] from a hole there used to be therein but which has since closed up, near Ol-doinyo-'le-Lepisiek. We came south with the Masai a long time ago. Formerly we lived around Moita and Ol-oitip, but have now come down here to Moipo. Others of us went north to the Serenget' plain. We are not Masai, but they are our brothers, and we have married their

[1] Mr. F. J. Bagshawe, in a recent number of the *Journal of the African Society*, mentions that a "fisherman clan" of the Dorobo lives in the Ruvu river valley.

[2] See *Die Masai*, M. Merker (Berlin, 1910), p. 229 *et seq.* I think the Dorobo dealt with are *Aramanik* for the most part, though *Aramanik* and *Mósiro* may have been confused, to judge by the account given on p. 257.

[3] The *Aramanik* name for Kisongo. See p. 132 in *Journal* for January 1928.

2: Maguire G-5 (ca. 1926) 1927-28
FL6 Dorobo FL6

or whether they are as closely connected as the *Mósiro*, *Médiak* and *Kisankasa*, I am unable to say, as I have had little opportunity of meeting them or of making inquiries about them.

The *Kitokorda* and *Kisangara* live in the country of the Wanguu and Wazigua,[1] and are stated to have lived always with or on the outskirts of these Bantu tribes. On the formation of the Tanganyika Masai Reserve in 1923, the Wanguu and Wazigua inhabiting the Talamai–Gitu–Mtambalo area were moved eastwards. With them went the *Kitokorda* and *Kisangara*. Rumour says that many of them would have preferred to remain in Masailand where honey is plentiful, but their Bantu masters were adamant and insisted on the Dorobo following them. The *Kitokorda* and *Kisangara*, dependent for the necessities of life on the Wanguu and Wazigua (particularly in a bad season when honey and game are scarce) went perforce.

The *Kitokorda* and *Kisangara* spend a considerable amount of time in the bush, honey-gathering. They are entirely ignorant of the Masai language, as a general rule, but know Kinguu and Kizigua and often both. They are stated to have a primitive tongue of their own, but on this point I am unable to speak definitely. It has also been said that some of them speak the *Mósiro* language, and although this may be the case, I am inclined to think that the presence of a few *Mósiro*, who live in scattered settlements just on the Handeni–Masai border and who cultivate small gardens of maize and millet, may have given rise to this belief.

The *Kitokorda* and *Kisangara* Dorobo may be impoverished Wanguu and Wazigua, but I think it more likely that they are Nilotic[2] in origin. There would seem to be little reason for an agriculturist to turn into a bushman.[3] The few *Kitokorda* and *Kisangara* I have seen differ entirely in general physical characteristics from their Bantu neighbours (who do not admit consanguinity with them), and their speaking only Kinguu or

[1] They are the names current among the Masai and the Dorobo in Masailand, but it may be that different names are used in the Handeni country.

[2] To the west of Handeni Station in the Pangani District.

[3] Perhaps it would be better to say Hamitic.

[4] [But is not this the case with the Bakalahari in South Africa, stated on good authority to be impoverished Bechuana?—A. W.]

2: Maguire G-5 (ca. 1926) 1927-28
FL6 Dorobo FL6

Kisigua (if this is so) may indicate nothing more than the fact that their own language has been lost. My remarks are only in the nature of pure surmise, because, as I have said before, I have had no opportunity of conversing with or investigating these people.

This, as far as my information extends, concludes the list of types of people living in, or adjacent to, the Tanganyika Masai Reserve and calling themselves "Dorobo." In the Burungi area of the Kondoa District there are a few impoverished Burungi who live a bush life and who are sometimes referred to as "Dorobo" by their fellow-tribesmen. I imagine that they are the same, relatively speaking, as the *Balañga* and have no more real claim to the name Dorobo than have the Burungi themselves.

Dorobo Arms

(Unless otherwise stated, all native names are in the language of the *Il-Mósiro*.)

The following arms and equipment are commonly carried by the Dorobo in his wanderings through the bush. Many of the articles are in use by the Masai, but with the exception of the sword and throwing-club (which are Masai arms) and the poison (which is manufactured by the Wakamba of Kilosa), the arms are made by the Dorobo themselves. Spears and shields are not used by the true Dorobo, though, as I have said, *Balañga* and *Kinyalañgat* who have abandoned their wanderings and have returned to the bosom of the tribe may, and often do, carry spears.

The bow (*kueanda*), which is always kept strung, is anything from four-and-a-half to five-and-a-half feet long. The length varies with the stature of the owner. There is no notch or other arrangement for affixing the string to the shaft—it is merely securely knotted at either end and never seems to slip. The wood used is that of the *Ol-porōwee'* tree and is immensely tough and strong. The shaft of the bow is sometimes coloured brown with the stain produced by the spittle made from chewing a leaf the name of which I have been unable to discover, but more often its pristine whiteness gradually fades to a dull brown

2: Maguire G-5 (ca. 1926) 1927-28
FL6 Dorobo FL6

very open but short sound. In the case of *shódahat*, the *ó* is so open as almost to sound like the *a* in the English *father*. 194

ˈ denotes that the vowel beneath it has a short, clipped sound. In *ilè*, the *è* is pronounced like the *a* in the English *fat*.

. beneath a letter means that it has a slurred sound. *ɸ*, *ɬ*, *ɣ* and *ɰ* in the Masai and *Mósiro* tongues are almost interchangeable.

With regard to the list of numerals given, the similarity between the Nandi, Suk and *Mósiro* words (up to 5) will be apparent at once. The Aramanik *one* and *two* are unlike anything else in the list, unless *kindei* can be said to resemble *akeŭge* or *epei*. 802 197

The Somali, Masai, Latuka and the two Dorobo words for six are all alike, but the *Mósiro* word for *seven* and the *Aramanik two* (as stated above) have no resemblance to any others in the several counts. Possibly the former may be a corruption of the Nandi *seven*.

Turning to the list of nouns; only the word for *ox* is the same, or practically so, in *Mósiro* and *Aramanik*. No other corresponding words would appear to have the least resemblance in these tongues (except *asíta* and *ajil*) or in Masai. However, the remarkable similarity between the *Mósiro* and the Nandi list will not fail to be noticed at once. 192 197

The names of the game animals, in the *Mósiro* language, would seem to have been borrowed from the Masai in some cases. There will also be observed a certain similarity between *Mósiro* and *Aramanik* in the word for *hartebeest*, and the word for *wildebeest* is obviously the same in all three tongues. The likeness between *Mósiro* and Nandi will here be noted again. [177]

Some of the simpler verbal forms from Masai and Nandi have been taken and the *Mósiro* equivalents inserted. The similarity between the last two is again manifest. It is to be regretted that I am unable to submit examples of the *Aramanik* verbal forms. These are extremely primitive and very difficult to write, and I hesitate to place on record the very hastily-written examples I have, so far, had the opportunity of obtaining. 192 197 198

It may be as well to mention that the *Mósiro* examples given herein were all written down before I had access to

2: Maguire G-5 (ca. 1926) 1927-28
FL6 Dorobo FL6

Hollis's book on the Nandi. I have left them just as they were written in the first instance, as it would seem an additional proof (if any be needed) that the *Mósiro* and the Nandi are very closely related. On checking them over with the *Mósiro* and with Hollis's book before me, I am not inclined to think that the *Mósiro* words could more accurately be written by conforming more closely to Hollis's Nandi spelling. The language of the *Mósiro*, though undoubtedly at one time pure Nandi, has become, owing to Masai and other influences, considerably modified, and I think that a *Mósiroi* from Talamai and a Nandi might have some difficulty in understanding each other if brought face to face.

The difficulty of setting down verbal forms which sound extremely alike and which appear to vary only owing to the difference in intonation in individual voices will be readily appreciated by all who have ever attempted the task. In addition, the *Mósiroi* is no respecter of persons, in the sense that " ye want " and " they want " are more or less the same to him. He rarely troubles to be accurate about his verbs (the same remark holds good when he is speaking Kiswahili), merely differentiating between the singular and plural and leaving it to the context to elucidate the precise meaning.

Very few examples are given. It was thought that a longer and more detailed list was outside the scope of a brief and unscientific paper of this nature.

No.	Somali.	Masai.	Latuka.	Nandi.	Turkana.	Suk.	*Mósiro.*	*Aramanik.*

[1] Cf. the Masai word for donkey, *O-sibiria, I-sirkon.*
[2] Cf. the Kiswahili *Ndovu*, meaning an elephant.
[3] Obviously the same word in the three languages.

In Masai, Nandi, and *Mósiro* there are many alternative names for the animals listed above. Only one example of each has been given in order to save space. The *Aramanik* words given have no plural forms. It will be noted how similar are the methods of forming the plurals in Nandi and *Mósiro*. [193]

In the *Mósiro* tongue the use of the article is vague in the extreme, and it is often a matter of some difficulty to ascertain whether it is being used or not. However, I think it exists and that some individuals use it more or less habitually, but

2: Maguire G-5 (ca. 1926) 1927-28
FL6 Dorobo FL6

192 the word seems to gain nothing from its inclusion or otherwise
• 197 and it would be difficult to lay down any rule about it.

The *Mósiro*, despite their laxity in the use of their own
[193] article (assuming it to exist), are, curiously enough, surprisingly accurate in their use of the Masai article when speaking that language. (See p. xxii of the introduction to *The Suk; their Language and Folklore* (Beech). See also p. 52 of the text of that work.)

[1] May be, and often is, omitted.

The negative present of the Nandi verb "to know" as conjugated above is taken from Sir Charles Eliot's introduction to Sir Claud Hollis's *Masai Language and Folklore*. The spelling of the other Masai and Nandi tenses is derived from
[197] Hollis's works on the Masai and Nandi. The examples of tenses in *Mósiro* given above (especially those without the pronouns) are submitted with diffidence. As I have said elsewhere, the *Mósiroi* is not a respecter of persons, and verbs seem to depend largely for their meaning on the context and on the conjoint pronoun. Very few *Mósiro* have any idea at all of conjugating a verb. The effort to reduce the *Mósiro* tenses to some form of lucidity entailed more work than I should
[128] have believed possible. The results are submitted for what they may be worth—I cannot vouch for their accuracy.

[2] Or I-tu-suj-u-tuá?

2: Maguire G-5 (ca. 1926) 1927-28
FL6 Dorobo FL6

laŋgat who lead a life of hunting. These people (being Masai and 'l-Oikop, if my conclusions are not erroneous) are pastoralists at heart, and nearly all the elders have their own small herds of cattle to-day. As for the younger generations, they are now Masai and 'l-Oikop respectively to all outward seeming.

The *Aramanik* (in the Moipo area) are also rapidly becoming Masai, and my failure to glean more information about them may be attributed to this cause. My opportunities for investigating the *Aramanik* of the northern areas (O-sụbuko L'oltatwa [1] and round the northern end of Eyasi lake) have been extremely limited, but it would seem that they are far less susceptible to Masai influence than are their brethren at Moipo and Lo-'sokonoi. The *Aramanik* present a definite problem, and I think it will be agreed that their possession of a distinct language and the very meagre information about them contained in this paper warrant further investigation with the promise of interesting results. It may be that their identity will be obvious to some people. I am not prepared to put forward any theory as to their origin and how they came to occupy the areas they live in to-day, but I am convinced that they are not Masai, as are the *Balaŋga*.

The *Kitokorda* and *Kisangara* Dorobo (if these be their true names) might also repay investigation. They certainly differ from the other types of Dorobo dealt with here.

Among the *Mósiro* Masai influence waxes yearly, and in time they, too, will cease to exist as a separate people. The comparatively high prices the Masai are willing to pay for *Mósiro* women; the fact that the Masai are always ready to employ the younger *Mósiro* men as herds; the stricter enforcement by Government of the Game Laws; all these factors contribute to the abandonment of bush life by the *Mósiro*, who are lazy but far from uncivilisable.

I believe the *Mósiro* to have been very closely allied to the Nandi at one time, if they were not pure Nandi.[2] The evidence of language would seem to be indisputable, but it is a more

[1] Ngorongoro localities. These Dorobo are entirely distinct from the *Kangeju*, written about by Mr. F. J. Bagshawe (see note 1, p. 249).
[2] See Hollis: *The Nandi*, p. 2.

3:Huntingford E-5 (1921-1928)1929 FL6 Dorobo FL6

Nouns in Dorôbo and Nandi have two forms for the singular and two for the plural, *i.e.* a primary form, as *muren*, [a] warrior, and *muren-et*, [the] warrior; the characteristic letters of the secondary suffix are, sing., -t (-d); pl., -k. Words of both languages are usually given in the secondary form; primary forms are distinguished by an asterisk, thus: *mpitiko**. When the Dorôbo use a Nandi word, or when the true Dorôbo is the same as Nandi, the words are marked by the letter N following. Mâsae words are marked thus: † (*engerait*†). 193

References.—H.M. = Sir A. C. Hollis, *The Masai*; H.N. = Sir A. C. Hollis, *The Nandi*.

I.—General Remarks on the Dorôbo Tribes: Their Origin and History.

The people who form the subject of this paper occupy the forest area north of Tindiret hill, above Muhoroni station on the Kenya and Uganda Railway, between lat. 0° 5′ S. and 0° 10′ N., and long. 35° 20′ E. and 35° 35′ E., the country that the Nandi call Kâpchepkendi and Kâmelilo (*see* Text-fig. 1). The Dorôbo call themselves Okiot, pl. Okiek (fem. Chep-okiot, pl. Chep-okiek), by which name they are known to the Nandi. By the Mâsae they are called Ol-Torôbôni, pl. Il-Torôbo (fem. *En-Dorôbôni*, pl. *In-Dorôbo*). From the latter form is derived the name by which they are generally known, Wandorôbo. The meaning of the name Oki-ek (stem Oki-) is unknown; the Mâsae name Torôbo may possibly be derived from the adjective *dorop* (pl. *doropu*) (short), in allusion to the short stature of the Dorôbo (*see below*, "Physical Features"), though Hollis (*The Masai*, p. 28, n. 2) thinks that it is not Since the word Okiek is not perhaps as well known as Dorôbo, I have used the latter throughout this paper. 101 [131]

People calling themselves Okiek are found in various parts of Kenya Colony, in forest regions. A list of the sections[1] of the Dorôbo is given by Mr. C. W. Hobley in *Man*, 1905, 21, together with a short vocabulary of three Dorôbo dialects. In a note to the same paper, Mr. Hobley adds a list of 48 words of the language of a section called "El Mogogodo," who live near the E-Uuaso Ñgiro, and who are thought to be Dorôbo. Whatever the origin of the vocabulary of the other Dorôbo languages may be, their structure is certainly Nandi; the "El Mogogodo" vocabulary, on the other hand, is apparently a mixture from various sources, among which I can trace Mâsae, Nandi, Turkana and Nilotic (Dho-Luo) words. The presumption is, therefore, that the "El Mogogodo" are not true Dorôbo. The earliest account of the Dorôbo seems to be that of the Rev. J. L. Krapf, who wrote in the introduction to his *Vocabulary of the Enguturk Eloikob* (1854) that "the Wandurôbo are poor people, eating anything they may obtain: they eat the meat of the elephant, and of all other game. They cover their huts with dry grass, not with skins, as the [197] [175] 105

[1] Not "clans," as Mr. Hobley calls them.

3:Huntingford E-5 (1921-1928)1929 FL6 Dorobo FL6

105 Wakuafi [Mâsai] do, who therefore boast of their own superior houses. These poor people speak the language of the Wakuafi, but it appears they have also a language of their own, the knowledge of which would undoubtedly enrich the treasury of
114 African philology." Krapf is, of course, writing of Dorôbo in contact with the southern Mâsai. The latest contribution to the study of the Dorôbo, that of Maguire in the *Journal of the African Society*, vol. xxviii (1928), is disappointing, and marred by an ignorance of Nandi, a knowledge of which is essential in treating of the Dorôbo. 2/A

101 The actual distribution and sections of the Dorôbo in Kenya and Tanganyika are as follows:—

Kenya Dorôbo.

[197]

1. Kâmelilo-Kâpchepkendi.	In contact with the Nandi-speaking tribes of Nandi, Kamasya, and Kipsikis.
2. Lo-'l-diani.	
3. Ravine.	
4. East of Kipsikis.	
5. Chepcharwanek, Kamiek, and Kipkurevek, on the Mau escarpment.	In contact with the Mâsai.
6. Nalêta.	
7. Kidong.	
8. Digiri.	In contact with Kikuyu-speaking tribes.
9. Siwiwek and Lelaviek, N. of Mt. Kenya (E. Uaso Ngiro).	

Tanganyika Dorôbo.

10. Taturu,[1] lat. 5° S.
11. Mosiro.[2]
12. Aramanik.[2]

● 197 All these sections speak dialects of Nandi, irrespective of the linguistic groups with which they may be in contact. The possession of a Nandi dialect seems to be one of the criteria by which true Dorôbo can be distinguished. (Sketch-map, Text-fig. 2.)

174 The origin of the Dorôbo is uncertain. Those of the Kâmelilo-Kâpchepkendi group do not differ noticeably from the Nandi in physical character, except in one or two details, which are probably due to environment; from this we cannot, therefore, derive much help. Mâsai and Nandi traditions point to the Dorôbo having been found by them where they are now, when they first came into this part of eastern

Africa; in the Mâsai story called "Naiterukop" (Beginner of earth) there were originally three things on earth—an elephant, a snake and a Dorôbo (H.M., p. 266); and in the Nandi story "Tapand' ap emet" (The beginning of the earth) God found three things on earth—an elephant, the thunder, and a Dorôbo (H.N., p. 111). The Dorôbo tradition that "we have always lived here" seems to confirm these stories.

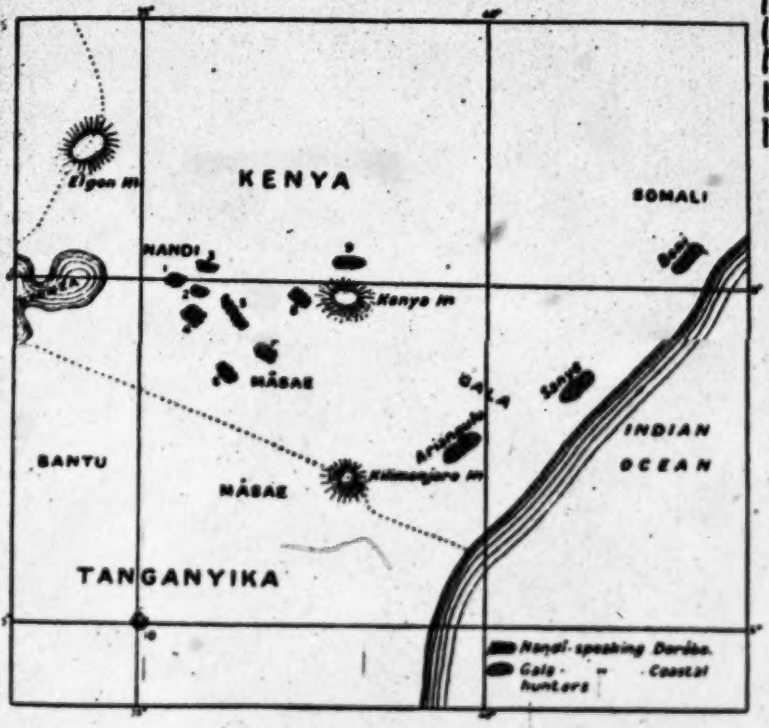

FIG. 2.—SKETCH-MAP OF EASTERN AFRICA, SHOWING DISTRIBUTION OF NANDI-SPEAKING DORÔBO.

stories. Further, Hollis quotes (H.N., p. 98) a tradition of the Moi clan, that a Dorôbo gave birth to a boy and a girl, who issued from a swelling in his leg, and who became the ancestors of "all the people upon earth." We may note that among the Kámelílo-Kápchepkendi Dorôbo the chief clan is the Moi or Kolgonyot. Such evidence as we have for the Nandi tribes points to a movement from the north; and since the Dorôbo resemble the Nandi in features, customs, and language, we can only

3:Huntingford E-5 (1921-1928)1929 F1.6 Dorobo F1.6

174 set forth certain theories as to their origin, which are offered as a starting-point from which to work. The theories are:—

[177] (1) That the Dorôbo are an autochthonous people who were found in East Africa by the Nandi and Masai, and who have assimilated not only the Nandi language, but also some of their customs and religious ideas.

(2) That the Dorôbo are part of the parent-stock of the Masai-Nandi group.

(3) That the Dorôbo are part of the Nandi sub-group, who broke off from the main body very much earlier than the other tribes, and had been separated so long from them that their original relationship had been forgotten by the time they came in contact again.

174 199 To all of these theories there are objections, not the least of which are linguistic. The conclusions arrived at with regard to the origin of a language do not necessarily hold good for the origin of the people who speak it; but in this case the language is almost the only distinguishable feature, and must therefore be taken into consideration. The true Dorôbo language, as now spoken, is closer to Nandi than Suk, and much closer than Masai. It appears that Suk broke off from the main group before the formation of the secondary suffix or "definite article"; Dorôbo and the rest of the Nandi sub-group possess this suffix, which I believe is peculiar to this sub-group. Assuming, then, that the Nandi language passed through a stage with no secondary suffix, of which Suk[4] is the only remaining example—and it must have done so, nouns with primary and secondary suffixes being used side by side, and the secondary suffix being obviously a later development of the primary form—how can we account for either (i) the presence of the secondary suffix in Dorôbo if it was one of the parents of Nandi, since it could hardly be expected that the parent language would be as fully developed as its daughter; or (ii) the absence from Suk of the secondary suffix, and its presence in Dorôbo, if both Dorôbo and Suk were early offshoots from the Nandi Sub-group? Consideration of the facts suggests that the secondary suffix was first used in the Elgon languages (Kony, Sapei, etc.). Language and tradition seem to indicate that perhaps the first theory is the most tenable; yet against it may be urged, why should the Dorôbo have assimilated the language and customs of the Nandi rather than those of the Masai? Should the first theory prove to be correct, we may suppose that the non-Nandi element in the Dorôbo vocabulary represents the language spoken before they came into contact with the Nandi.

000 In the coastal area of Kenya Colony there live other hunting tribes, known as Sanye,[2] Boni,[3] and Aringudu.[4] These tribes are of a very primitive description.

[4] *i.e.* The Suk subdivision of the Nandi group, comprising the dialects of Suk, Endo, and Marakwet.

3:Huntingford E-5 (1921-1928)1929 FLA Dorobo FLA

VI.—Language.

● 197 The language of the Dorobo is in structure a dialect of Nandi, which belongs, in point of development, to a stage between the Elgon dialects (Kony, Sapei, etc.) and Kipsikis (or Lumbwa). While many of the words are either (i) more or less the same as in Nandi, or (ii) the same as in other dialects of Nandi, a number of words do not belong to the Nandi group at all, nor have I been able to trace them in other languages; the assumption is that they represent the remains of the original Dorobo language. Masai (especially Uasin Gishu) has also contributed to the vocabulary.

Grammar.

193 *Letters.*—The spelling is the same as that used in Sir A. C. Hollis's book. As in Nandi, *k* is often inclined to a *g*-sound; in such cases it is written *k*; *k* sometimes inclines to a *w*-sound. There is in some words a broad *o*-sound, here written *oa*, for which Nandi has *o*; the broad *ae*-sound which Hollis heard in Tenguryiku appears here as *d*[1]; I could hear no trace of the reinforcement of *a* by *e* which he also heard (X.II., p. xxviii.)

[194] *Accent.*—The accent is equal on all syllables, as in Nandi.

Substantives.—As in Nandi, nouns have a primary form (without "definite article") and a secondary form (with "definite article").

The secondary suffix, or "definite article": (i) sing., *-t*, *-ta*, *-to*, *-da*, *-do*; (ii) pl., *-ak*, *-ok*, *-ik*, *-uk*.

Formation of the plural.

The general rules for the formation of the plural are as follows:—

(i.)

When the sing. endings are *-et*, *-ijet*, the pl. ends in *-ech*:—

Singular.		Plural.		English.
Primary.	Secondary.	Primary.	Secondary.	
[illegible]	[illegible]	[illegible]	[illegible]	[illegible]

(ii.)

When the sing. endings are *-it*, *-et*, *-ot*, *-ichot*, the pl. ends in *-ech*:—

[illegible]	[illegible]	[illegible]	[illegible]	[illegible]

[illegible]

* Though occasionally *oa* is heard.

193

the Kihendlo Kikyukyendi Dorobo (Okiek) of Kenya Colony. 301

(d) Reflexive—*Ndiku, kui.*

Present.		*Past.*	
S.	*P.*	*S.*	*P.*
1. *n'kwaa'i kui, I wash myself*	1. *tit'waa'i kui*	1. *kaa'a kwa'gui*	1. *kaa'tit'waa'gui.*

(e) Causal—*Ptuku, i-.*

Tweta, stand; i-tweta, make to stand.

This form is conjugated like ordinary i-stem verbs. (See above.)

(f) Reciprocal—*Ndiku, ewa, gwa.*

Present.			*Past.*		
S. 1. *n-ndi-kwa'a, I am silent with*	*P.* 1. *ki-ndi-kwa'a*		*S.* 1. *kaa-n-ndi-kwa'a*	*P.* 1. *kaa-ki-ndi-kwa'a*	
2. *i-ndi-kwa'a*	2. *m-ndi-kwa'a*		2. *kaa-i-ndi-kwa'a*	2. *kaa-m-ndi-kwa'a*	
3. *ndi-kwa'a*	3. *wa-ndi-kwa'a*		3. *kaa-ndi-kwa'a*	3. *kaa-wa-ndi-kwa'a*	

Imperative.

S. ndi-kwa', be silent with (someone else). *P. n-ndi-kwa', be ye silent together.*

Adverbs, Prepositions, and Conjunctions.

Tweet, above.
Kee-kwey, again.
Ah, until.
Bilig, at, in, to, from.
Amee-ee, however.
Tee, before (place).
Lit, behind.
Ngwey-ya-yuk } *before.*
Of'-kwik-ee }
Kwee, between.
Lit, for.
Ondi, inside.
Kee-ke } *like.*
Kwe }
Ankinka, on.
Tweee, not yet.

Ngaka, now.
Aji, yes, of.
Mandai, not.
Kee-ekie (see ee), quickly.
Mwiin, slowly.
Ke, to-day.
Tweegweeta, day after to-morrow.
Tee, to-morrow.
Mbaliq, very.
Pwik, to-morn.
Ee, ele, ekee, ekee.
O, yes.
Amwi, yesterday.
Ekie, day before yesterday.
Kwey, ele-kwye, of old.

Vocabulary

(a) Nouns.

In this vocabulary, nouns are given in full; the secondary forms are in brackets. Comparisons are given with Kwey (Kw.), Segei (Seg.), and Suk (Sk.); words of these

192 [191]

192 dialects are given in the secondary singular? Minor words (M.) are given in the
197 singular. Where a word is the same as in Masai, the letter (M.) is affixed. Where a word is apparently original Dorobo, the letter (D.) is affixed.

(*b*) Verbs.

192
193
197

Verbs are given in their stem (*i.e.* the imperative sing.) only. The following, after a verb, denote that it is a derived stem, and conjugated as described in the Grammar under the heading which is affixed to it:—Pros. = motion hither. Apo. = motion thither. Dat. = dative. Rf. = reflexive. Ca. = causal. Rp. = reciprocal.

Able (be)	imũch (N.).	Copulate	kum (N.).
Abuse	chup (N.).	Cough	lal (N.).
Angry (be)	nereket (N.).	Count	iit (N.).
Answer	iyan (N.).	Cry	rer (N.).
Arise	ũget (N.).	Cut	til (N.).
Arrive	it-un (N.) (Pros.).	Delay	ikaa-kei[1] (N.) (Rf.).
Ascend	lany (N.).	Die	*S.* 1. a-me (N.).

Note.—In the foregoing vocabulary the letter (N.) does not necessarily mean that the equivalent Nandi word has exactly the same meaning or the same form as the Dorōbo word. In several cases the Nandi words have quite different meanings, though referring to the same sort of thing as the Dorōbo word, *e.g.* "mesundeito," the Dorōbo for "night," means in Nandi, "darkness when there is no moon." And when, *e.g.*, "paal" is marked (N.) it does not necessarily follow that the Nandi is "paal" (in this case the Nandi is "pal"). The object of the indication is to show what words are to be considered Nandi, what words are to be considered dialect, and what words Māsae.

Examples of Dorōbo. (True Dorōbo in italics.)

Ker-oti *Okick* si ko-*sue* *kochongesiek*

IX.—The Physical Features of the Dorôbo.[2]

By the Hon. P. L. O'Brien, M.A.

The physical features of the Dorôbo are not particularly distinctive, nor do they differ to any great extent from their neighbours the Nandi. There are, however,

[1] It is curious to note that this word is applied by the Suk to the Dorôbo; by the Nandi to any agricultural tribe; and by the Masae to the Bantu " savages." It has no connection, as is sometimes thought, with the N. Lemek = " the Kavirondo peoples in general," the stem of which is lem-, and the real meaning " bay."

[2] For physical types, see Pls. XXVI-XXVIII. These photographs were taken by the Hon. P. L. O'Brien.

3:Huntingford E-5 (1921-1928)1929 FL6 Dorobo FL6

In conclusion, I do not consider that the physical characteristics of the Dorôbo throw much light upon the controversy as to their origin. These characteristics tend, if anything, to indicate that they are a Nilo-Hamitic race, which has been somewhat altered by environment.[1]

[1] In the foregoing paper no remark has been made as to the "false" Dorôbo. There are a large number of people of all sorts of tribes, whatever taken to the woods, and live as outlaws, mostly on account of some misdemeanour. The numbers of true Dorôbo have probably been swelled also by people from the tribes next to whom they dwell, e.g., Maasai, Nandi, etc. But these additions to the numerical strength of a certain are by no means Dorôbo, though they may be so in name. And I cannot accept Merker's view of the origin of the Dorôbo. (*Die Masai*, pp. 6-9, 271, etc.; *Man* Werner's review of Hollis, *Nandi*, in *Man*, 1910, 92, p. 166.) Merker's work is not, I believe, very reliable, and he seems to be a rather prejudiced observer. The physical characteristics which we have noted may perhaps, be taken as one indication among others that the Dorôbo we met were true Dorôbo, and not outlaws of other tribes. The effects of environment are not likely to make themselves visible in a few years only. The fact that these Dorôbo vocabularies (luckily recorded by Mr. Hobley, *loc. cit.*) show that the true Dorôbo language is similar to Nandi in structure, may, I think, be take accurate evidence against those who maintain that the Dorôbo of Mau, Elgeyo-Marakwet, Kenya, Baringo, etc., are formed mostly of outlaws from neighbouring tribes.—(G. W. B. H.)

I. Introduction[1]

The Dorobo are a hunting people, primitive, shy, and elusive, who live in small groups scattered over the high forest lands of Kenya Colony and parts of northern Tanganyika Territory. They all speak dialects of Nandi, the vocabularies being more or less close to Nandi according to their distance from the Nandi area, and many of their customs and institutions

[1] This account of the Dorobo is based upon field work done in the Tinderet Forest area between May 1938 and November 1939 under a Leverhulme Research Fellowship. A previous visit I had made in 1927 was still remembered, and in 1938 I had little difficulty in renewing my acquaintance with the people, in which I was greatly helped by one Arap Mining, my guide in 1927, whose name is mentioned several times in the following pages. To his tact and knowledge is due any measure of success that I may have achieved.

I take this opportunity of expressing my gratitude to the Leverhulme organization for making the work possible, and to various people, notably Professor E. E. Evans-Pritchard and the late Dr. C. G. Seligman, for help and encouragement. I wish also to express my thanks to Messrs. G. A. Corrance and E. G. Whitfield for their kindness to me when I was visiting the Dorobo in the neighbourhood of their farms.

The conditions described in the following pages are those which obtained up to the year 1940.

6:Huntingford E-5 (1938-1939) 1953 FL6 Dorobo FL6

435 1 bundle of tobacco (about 1 lb.) for 1 bagful of honey.
1 large earthenware pot for 1 large prepared antelope skin.
1 small earthenware pot for 1 small prepared antelope skin.
2 baskets of cereal seed for 1 basket (*kwelut*).
1/- worth of trade beads for 1 gourd full of honey.

[204] The bag used as a measure for honey is the smaller size of *kwelut*, measuring 7 or 8 ins. by 6 ½ or 7 ins. The gourd is about 10 ins. long. The large pot stands about 20 ins. high, the small, about 10 ins., and the large antelope skin is usually a bushbuck, the small one a duiker.

437 There are no special market places or places of exchange. The Dorobo
436 go to the nearest smith or potter and make a bargain, returning later with
[443] the exchange equivalent to collect the goods. There is no language difficulty
[197] in these transactions, for the Dorobo language is no more than an easily understood dialect of Nandi. Getting iron or pottery means going into the Reserve, but to get seeds, tobacco or beads they need only go to the nearest friendly Nandi who has what they want and is willing to make the exchange. Sometimes plant material of medicinal value (i. e. what they think is medicinal value) is substituted for some of the regular exchange articles, but the above list represents the ordinary practice. When Dorobo have money with which to buy what they want instead of exchanging goods, they have the choice of going to the shops at either Songhor in the south, or else at Aruwa in the Nandi Reserve, where there is a collection of Indian shops. The men do not
[562] like their waterbuck to go to these places unescorted, but occasionally some of the bolder ones try to slip away unobserved to Aruwa; they seldom go to Songhor, as it is in the European area.

476 No human group can exist without some form of co-operation, and even when a man lives alone, as he may have to among the Dorobo, he is not because of that cut off from or unable to share in the activities of his kinds. Within the family people are interdependent, and in the settlement they help each other. The main activities in which people normally co-operate are four in number: 1. House-building; 2. Hunting; 3. Digging earth; 4. Cultivation.
[462] (1) Building huts is women's work, which a man will do if he has no wife, and
[234] for which he will get help from a relative or clansfellow. (2) When people
[197] hunted game they usually went out in parties, and the kill was shared among them. (3) Digging earth means a journey of anything up to 10 miles round the edge of the forest and into country where nowadays there are strangers, so people find it both safer and more convenient to go in parties, for though they are in no danger of being attacked, their unco-operative shyness demands numbers to give confidence. (4) In a family or clan group, though each individual has his own
[241] shamba, he will expect both to help and to be helped by the other members.

[276] Together with the spirit of co-operation is the rule of joint consumption. We have already seen how meat is shared according to definite rules; and among the Dorobo certain other things which are hard to come by must also be shared. The chief of these is tobacco, of which when a man has acquired even a small supply, he is supposed to give some to his father, to his wife's

J. ye FL8

776 *Religion and Magic.*—God, the creative being, who long ago made all things, but who is now mostly asleep, is called *Tuhanki*. He was not the first man—indeed, nobody knows who the first man was—nor has he a female counterpart. Other as he is, he can on occasion
[782] be persuaded by means of sacrificing a goat to intervene in human affairs, as when, for instance, the crops are bad and rain is needed.

791 The wizard is known as *Kenenjeni*. His functions are the same as those of the *Ajaks* of Labuan, and like that functionary he is a rain-maker, who though more efficient in this respect than an ordinary person is not prepared always to guarantee results. Perhaps not more than 20 years ago there was among the Wanderobo a great rain-maker whose name, Longaloi, is still well known to all the surrounding tribes. His powers were widely admitted, and he was consulted, not only by the Wanderobo themselves, but also by the Dadathe, the *Ilo*, the *Kenenjeng* and the Turkana people, but not, however, by the Dorlogo of the Sudan.

789 When the rains were late and the country was suffering more than usual from drought, representatives of the tribes would come in with generous presents of livestock and food. These would be gathered and heaped together near Longaloi, who would sit quietly smoking, as it is related, till he considered the offerings sufficient, when he would locate himself in the matter of making rain. He, and the various representatives of the suffering tribes, would then partake themselves to a spot called Kalagoria, in a ravine that runs down into the Elit valley, where grows a giant fig-tree near a water-hole that, it is said, never dries up. A black goat would then be brought and be dashed in the water, but not allowed to drown. After this it would be speared in such a way that the contents of the stomach would be extracted without damaging the viscera, which would then be filled with water. The procedure then was to hang the goat in the top of the fig-tree, while Longaloi called upon Tuhanki to send rain. At the conclusion of the rain-maker's incantations, the goat would be cut down, and as it fell with a thud to the ground, those taking part in the ceremony would rush in, drain out all the water that remained within the body after its fall, and bear it away to a fire already prepared and cook it. The meat would be eaten by those who took part in the ceremony, and in due course the rain would fall.

791 Longaloi enjoyed a great reputation, and it is admitted, on all hands, that he was a long among rain-makers. He is much regretted by the Wanderobo, who say that since his death (he died in the Turkana country) the rains have been poor and uncertain, and "things are not what they used to be" in his day. His son is, or was, a chief in Turkana. It is to be noted that Longaloi was not a chief, but first and last a rain-maker, and the last of a long line of such specialists. I could gather nothing reliable as to the mode of burial of such folk.

[821] I recently contracted with the present Wanderobo chief, with whom I was on very good terms, to visit the rain-maker's shrine by the giant tree. We were to start before dawn, but alas! the chief's courage failed at the last moment, at least I suppose so, for he disappeared and I and my search party failed to find him. I never saw him again.

1897 A few measurements and a very short sample vocabulary follow. There seem to indicate differences between the Wanderobo and their neighbours. The most marked difference is, perhaps, in their speech, for although the Wanderobo speak "Kenenjeng," the tongue which,

[illegible] with dialectical variations, in common to the rest of Sovereign [illegible] the full value of Sheet Orthodox (Kashubian) and Modern Slovenian, they form a language of their own.

Kenyenjin Terminology—(contd.).

English.	Dinkidin.	Kenyenjin.
[illegible]	[illegible]	[illegible]

Tree Diseases.

The Dinkidin resemble the Lubwa and the Wandendin in appearance and dress. Their country, like that of the Zo, is that of the plains; and, like the Zo and the Kenyenjing, they are "cattle people" and possess numerous herds.

The Village.—The Dinkidin village (see p. XXIV, Fig. 1—somewhat like that of the Wandendin, except that there is but one outer enclosure (a very strong one), and the interior enclosures round the kraal groups are to a greater or lesser extent omitted. There is also a special compound for cattle. The huts, too, are purpel and well made, and the entrances are larger than those of the Wandendin.

The *purpel* of the hut walls is done with clay and is rendered with cow-dung. A well-built hut has a little portico to the door and two upright supports, also purpel and rendered, are placed in front of this (Text-figs. 21, 21a and 21b).

Each village is the home of a patrilineal, his wives, sons and grandsons, and their wives and children. The villages occur in widely separated groups, each group being occupied by a section of the tribe. The sections are exogamous and non-totemic.

Clothing and Adornment.—Little need be said under this head, for what is true of the Lubwa is also true of the Dinkidin in this respect. It may be mentioned, however, that the people are very fond of ornaments of all sorts, and one infrequently sees one old man whose heads are surrounded by a circlet of sheep's teeth (Pl. XXV, Fig. 1).

Food.—The essential food of the Dinkidin is blood, milk and meat. The first two they swallow raw. Now that they are growing grain this is some use. They frequently tie a calved with fresh blood taken from live cattle tied at intervals for this purpose, or from a sheep or a goat, the body cavity of which is used when the animal is killed as a receptacle into which the warm blood is allowed to flow. Several kinds of grain have been introduced, but millet is by far the commonest grown. An attempt on the part of the Native Commissioner in 1929 to introduce bananas proved a failure, owing to the long droughts from which the country suffers.

[1] "Purpel" is an old-fashioned technical term for a process of smearing the walls of dwellings with cow-dung. The modern equivalent is "wattle-dagb".

/54 cont'd/

in the dense forests of Kenia and Kikuyu, the forest-clad escarpment of Mau, the top of Elgeyo, Marakwet, Chilelisaragwani, Buru, Dondote etc. They are rarely found in numbers and usually in very small villages, so that there is nothing like tribal /55/ life among them. They enjoy considerable immunity from attack by the Masai, as they are sources of wealth to the latter by attracting the coast traders: usually, too, the Masai fall heir to a considerable share of the ivory. They also act as go-betweens or middlemen in getting the married people the vegetable food they require. To such an extent is this system carried, that on the plateau to the east of Naivasha at the place called by the traders Mianzi-ni, a very large village of Andorobbo have altogether given up hunting, and subsist entirely by buying vegetable food from the Wa-kikuyu and selling it again to the Masai or it may be the traders.

"The language spoken by the Andorobbo is allied to that of the Masai, but they can all speak the latter in its purity. They build regular villages, and in general appearance they resemble the inferior class of Masai. As I have already remarked, they make the buffalo-hide shields of the warriors as well as the coarse earthen cooking-pots of the women. They are on the whole looked upon as a species of serf, and treated accordingly. Their transactions with the traders must be done secretly, or everything would be stolen from them."

Mr. C.W. Hobley, in the glossary to his Bantu Beliefs and Magic, says:

"Dorobo in Masai means tsetse fly. The name for an aboriginal race of hunters who inhabit the great forests of the highlands in East Africa. They call themselves Ari and the Kikuyu call them Adzi. The name of the Athi River is believed to be a corruption of Adzi."

/30 cont'd/

unceremoniously by wholesale rape rather than swallowed by peaceful penetration, raised a type of humanoid (some of the tribes we have with us today) inferior to themselves. There is very little in general principle common to these two views except that the Dorobo, if it interests them, can claim some small degree of aboriginality to both.

34. Dr. L. S. B. Leakey told the Land Commission:-

"... there are Dorobo and Dorobo. There are Dorobo who are the nucleus of the Dorobo and are a tribe quite distinct from anything I know in the country. They speak a language which I have completely failed to connect up with any of the languages spoken by the other tribes here. There are two or three families living on the Mau today. Round that nucleus you have deserters from Masai, Kikuyu, Nandi, Lumbwa, and all sorts of other people. You thus come across a mixed Dorobo people who have left their tribe and become Dorobo in the wide sense. Up behind Kijabe there are innumerable families, half true Dorobo and half Kikuyu ... They call themselves Kikuyu, but live like Dorobo ..."

35. Modern Kikuyu opinion among the older men is that the Dorobo, though legends suggest a remote relationship with the Kikuyu as well as others, were a separate tribe, speaking a language of their own, who subsequently became mixed up with other people who adopted their way of life. Some identify them with the Ilkumone of the Masai, but the Dorobo of Kenya repudiate this and point out that there were no stalls among them and that they might have eaten and run implements from the Masai and, later on, the Kikuyu. Mr. Jomo Kenyatta, however, regards the Dorobo as a Kikuyu-Gumba blend. In facing Mount Kenya he writes:

"... even after the Gumba had disappeared as a race, there came into being another race of human beings as Dorobo or Athi, who seemed to have grown like mushrooms in the forests.

Bibliography C-S (ca. 1930-1949) 1956 FLA Dembo FLA

/16 cont'd/

Unlike their predecessors, they were not short in stature, but something between the Gumbe and the Kikuyu. Also they did not live underground, but built their homes on the surface, almost as circular huts as those of the Gikuyu homesteads. Their language, too, was similar to the Gikuyu. To a certain extent the two tribes could understand one another with little difficulty.

With these evidences it would not be assuming too much to say that the interbreeding between the Gumbe and the Gikuyu was responsible for the disappearance of the Gumbe as a distinct race, and the producing of the Ndorobo or Aathi, who became the new owners and the hunters of the forests ..."

/20/ 22. With regard to language I have satisfied myself that the Dorobo now living at Kericho, who are the ones with whom we are particularly concerned, spoke a language of the Nandi type. Old men still speak it, though they also speak Kikuyu. The younger men use Kikuyu almost exclusively. In the Dorobo language, as still spoken by the older men, there has been considerable borrowing from Masai, though the bulk of the vocabulary is Nandi-like. But when both Masai and Nandi are excluded there remains perhaps an element which may be a residuum of pure original Dorobo, or may merely represent the degree of variation one would expect in any dialect severed from the other dialects of its group for a lengthy period, as one must suppose the particular dialect of Nandi or pre-Nandi to have been. The old men say that the language they speak today is the only language spoken by Dorobo tribes in former times, so far as they know. They can manage to understand a Nandi or a Kipsigis, but do not find it easy. So far as I could make out in the time at my disposal the grammar of the language, like its vocabulary, is of a Nandi type. A few comparisons are given here to illustrate the vocabulary. Infinitives are given in the form with the prefix and verbs are given as stems only.

Complete accuracy is not claimed for this list of Dorobo words; accuracy is not easy when one is dealing with aged men with unreliable memories; they are so apt to answer in long sentences which doubtless contain the words one wants but smothered under a mass of verbiage entirely unintelligible to one not previously acquainted with their language. But the list is sufficiently accurate to fulfil its purpose, which is to relate the speech of these Dorobo to some other dialect of such a relationship exists in fact.

ET. And then, I think, is just about as far as we can go towards an ethnological synopsis of the Dorobo people in the present state of knowledge. It seems, then, likely that there was some section of a people who retained their hunting culture when the rest of them assumed a settled pastorality or agriculture. Just when these people were on record yet say. The scanty evidence we have points to their being connecting link with a cattle-grazing race, and their retention of a Bantu type would seem to fit the facts as well as any. It would be unsafe to base our findings on their language, but if we permit ourselves to talk of these immigrations from the east and mid-Nilotic

9:Hobley G-5 (ca. 1900) 1903 FL6 Dorobo FL6

They are said to be very prolific, having families of eight to ten children, but the infant mortality is so extremely heavy that their numbers increase very slowly: this mortality is probably due to the cold, damp climate of the Mau Forests, which are at an altitude ranging from 7,000 to 9,000 feet.

Their peace ceremony consists of cutting off a dog's ears, and the contracting parties then sprinkle one another with the blood.

They live principally on Colobus and other monkeys, which they shoot in the forest. At certain seasons, however, they go and hunt big game on the plains, known as the Ewaso Nyuki; they wait till the grass is dry, and then burn it to facilitate their hunting. They use poisoned arrows for big game, and unpoisoned ones for monkeys, &c. They train dogs to assist in their hunting, and are very keen to get young dogs for this purpose. They told me that they first gave the dog certain medicine, and the animal would then track game.

They are very clever elephant hunters, and informed me that when they came across an elephant they went off and hunted and searched themselves very carefully to remove all trace of the human scent, and that they were then able to approach a sleeping elephant and spear it with a poisoned dart.

They are most expert in the use of a firestick. The fire is produced in the ordinary way by the friction of one stick upon round vertically in a depression in another piece of wood, which is held firm between the bare foot of the operator; the lower piece of wood appeared to be the favourite of Man.

A small vocabulary of their language is appended on the opposite page. They use the Kwafi numerals.

The prefix "ki-" and the suffixes "-ai," "-ki," and "-ik," are, I think, brought in from the Kwafi language, but most of the words will be found to be quite distinct. Many of the tribe can only speak Kwafi, and when collecting this vocabulary in some cases they appeared to have forgotten the Dgglish or Gwafi word but gave the Kwafi word, and had to search among themselves and, as it were, hunt up the proper word. The language is thus evidently dropping into weak disuse that it will probably become quite extinct in the near future.

C. W. HOBLEY.

[24]

depths of the forests on that mountain. The latter was referred to in a description of the journey in the *Proceedings of the Royal Geographical Society*, August 1903 and August 1904. During thirteen long years nothing was heard of these people, nor does any other traveller seem to have referred to them; it was therefore with some interest that a representative of these people was discovered in a Dorobo colony found on the north-east side of the Aberdare range in the vicinity of Fle swamp, and it was then elucidated that the hunted people are the Digirl clan of the Ogglek tribe, and that they acknowledge as their ruler a chieftainess named Ongitore who lives near Nyeri Sta. She is married to one Sikirai, who is also said to be one of the hunted people. Needless to remark, the possession of hoards and their acknowledgment of a female ruler are features of great rarity in Central Africa. Although the information is still very scanty, it has been considered advisable to communicate it in the hope that it may prove an incentive to further research. I append short comparative vocabularies of these dialects of the Ogglek language, and at the same time give in separate columns the Nandi and Masai equivalents for purpose of comparison. It will at once be seen that some words are the same in Ogglek language as Nandi, and other words are the same as Masai. At first sight it might appear that the Ogglek had borrowed these words from Nandi and Masai, but it is rather remarkable to find the Digirl clan of Ogglek, whose great haunt is the Kenia forest, using many Nandi words when practically the only languages spoken in that region are Masai and Elkoya.

They all speak Masai because there are a number of pure Masai living among them—people who lost all their cattle in the plague of 1891 and after that took to a hunting life. It therefore seems to me highly probable that the so-called Nandi words used by the Digirl people may be true Ogglek words gradually borrowed by the Nandi and now incorporated with the Nandi language; in the same way a few Ogglek words may have become incorporated with Masai. The subject is one of great interest, and it is to be regretted that our opportunities of studying these people are so infrequent.

The following is a list of the Ogglek clans:—

Clan.	Chief.	Clan.	Chief.
Ogglek of Kamilio or Timboit	Kipsongiun.	Ogglek on the Mau range, west of Nakuru	Kipkorouk.
Ogglek, east of Lumbwa country	Pilolum.	Do. do.	Kamish.
Ogglek in Elgeyo Escarpment	Kokimonglok.	Ogglek, south-west Kamis and also Fle swamp	Digirl.
Ogglek, north of Kamis	Sisirok.	Ogglek of Kisiam, north of Kamasyiro	Lelorish.
Ogglek of Lelithoi	Kaiwam.	Ogglek, south of Kabolil plain, south-west of Nakuru	Sainte.
Ogglek on the Mau range, west of Nakuru	Chebiskwonsh.		

The head Laibon of the Ogglek is said to be one Lemenkis, who lives with the Masai at Ngong hill Station, a hill in the region of the Lower Kedong.

The Digirl have a chieftainess named Ongitore who is said to live near Nyeri, or Kabogye in North Elkoya. I would mention that I am indebted to Mr. A. C. Hollis for the Masai equivalents in the vocabulary.

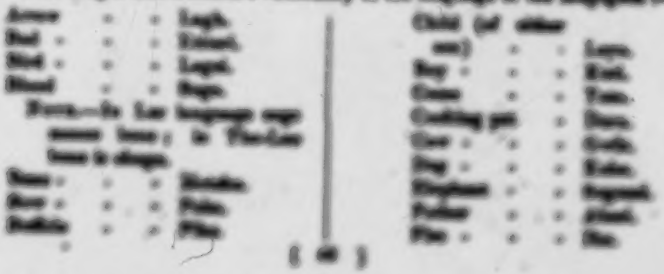
Note.—Since writing the above I have heard from Mr. Arthur Neumann (the author of *Elephant Hunting in East Africa*, and a man whose knowledge of the El Dorobo is unrivalled). He tells me that he has discovered an isolated clan of these hunters in some hills near the Kenia Fyke, and north of Mount Kenia. These people call themselves the El Mugogodo, and asserted that they were distinct from the Dorobo of Mau.

D
192

Mr. Neumann collected a small vocabulary, which I append. I had hoped at the outset of this research to discover that all the gipsy tribes would be found to speak an allied tongue, but more studies than my to save this view does not gather much support.

The following is Mr. Neumann's vocabulary of the language of the Mugogodo :—



12:Dundas G-5 (ca. 1900) 1908 FL6 Dorobo FL6
Kikuyu FL10
Masai FL17

Sopi is said to have instructed the Dorobo to bring him a pair of sandals made of leather having hair on both sides, the Masai to bring him a bull, the dung of which was purewhite, and the Kikuyu an animal called Hako (a burrowing rat or mole).

The Dorobo cut off the ears of a donkey, and produced these as the required sandals before Sopi; the Masai brought a bull fed on milk only; and the Kikuyu the animal called Hako.

Sopi then sid each tribe to take its respective charm and to attack the enemy separately and : different points.

The Masai marching into Kikuyu from Kaiyaku, fell upon the strangers first, and taking all the stock drove them on to the Kikuyu, who in their turn drove them on to the Dorobo, by whom they were finally routed.

The Sonai or Gallas were thus disposed of, and only by the name Irogi, which was give to the generation that fought with and expelled them, and by a few women of teir tribe, taken prisoners by the Dorobo, are we reminded of their settlements in Ukuyu. Amongst these prisoners may be mentioned an old woman called Kerobio, who is still alive and resides in one of Bungu's villages. She was formerly Chief Karuf's slave.

Needless to say the Masai kept all the cattle which they captured, and this caused a rupture between them and the Dorobo and Kikuyu, who joined forces and waged war on em. After a time had been made the Dorobo and Kikuyu fought amongst themselves.

If the Kikuyu were to live and increase they had to cultivate the ground, and to do so they were obliged to destroy the forests. The very existence, however, of the Dorobo depends on the preservation of the forests, and hence arose a struggle for survival, which forced of no compromise and could have but one end.*

In an incredibly short time the great primeval forests, the home of the Dorobo, were destroyed, and with them this interesting people ceased to exist as a tribe. Deprived of its means of living, many died, some took to cultivation, whilst the majority migrated to other regions, where they formed small colonies, such as are to be found at Sengo, Kaiyaku, Kaviau, Kijabe, on Lolldipia and Mau, at Taveta, in German East Africa, and even, it is said, in places as remote as Kisumayu—(the chief that went to th last place was the Agumba). This scattering of the tribe accounts for the peculiarity that Dorobo living in widely different localities speak the same language! ?t Sengo, Kaiyaku, Kijabe, and Kaviau Dorobo, and those of similar colonies will, questioned as to where they come from, usually mention Kaveirondo and Kavirondi, tribe birthplace of their fathers.

As regardsthe origin of this interesting tribe, we know little or nothing. There appear to be three two branches, the Agumba and the Okiek: the former hunted the game on t plains, the latter in the forests. They lived in pits dug in the ground and roofed over with leaves of the wild banana; these pits may to this day be seen anywhe in the Kikuyu country, though of course they become more numerous the nearer one approaches the forest. They are also said to have buried their

* The first [illegible] of [illegible] [illegible] [illegible]

12:Dundas G-5 (ca. 1900) 1908 FL6 Dorobo FL6

dead, and to have sacrificed to them: the few still surviving are believed to sacrifice every year (or more probably every Mwaka) to their ancestors. They spoke a Nilotic language*: but languages go for nothing in this country, where a whole tribe will with the greatest facility in the course of a single generation change its language. The Dorobo themselves say that they, the Masai and the Kikuyu, are the descendants of a common ancestral tribe called the Eudigiri, and that their ancestors came from beyond Mount Kenya. They also maintain that the clans of all three tribes are identical: that, for instance, the Aimakaboro clan in the Mokoren of the Masai: the Asijire, the Taruaro: the Ambui, the Maiejan: the Akharibibo, the Aisir: and so forth.

Their Masai name of Il Torobot might, perhaps, imply that they are descended from a tribe of dwarfs: but though there are undoubtedly pigmy tribes of Dorobo, such as the Mois‡ of the bamboo forests of Mount Kenya, the Dorobo in existence at the present day are of much the same stature as other tribes in East Africa. The dwarfish figures of the Mois Dorobo may possibly be explained by the life they lead.

Compared with other natives the Dorobo are not deficient in intelligence: in fact, in many respects rather the contrary is the case. Dorobo wisdom and cunning are proverbial amongst the Kikuyu and Masai, who consult them in cases of sickness and accidents.

E. S. DUNDAS.

REVIEWS.

* It is difficult to account for the peculiar fact that they spoke Masai. There are, it appears to me, reasons for believing that a large number of tribes now living in East Africa originated from the north end Mount Kenya, and passed through the Kikuyu country. Many of these, and also many have been the case with the Masai, Lumbwa, and Suk, may have settled down in those fertile regions for a period sufficiently lengthy to have impressed their language on the aboriginal inhabitants. It is quite possible that very large areas may have been subjected during, and abandoned after such occupations.

† Torog, pl. dorogo, means short in Masai.

‡ Sandgrol and Mois are different names for the same people: they are also known to the Kikuyu as Aramanikoma. This name is said by some to have been applied originally to all the Dorobo in Kikuyu. The name Ark Ayak might possibly mean this tribe, in which case it bears out the theory that the Dorobo were originally the ruling tribe in the country. It is, perhaps, worth mentioning that the word ayak, one of their father's principal wives, is possibly the same as Ark, the Kikuyu name for the Dorobo.

According to the Worshippers of the Church Missionary Society, the same classification seems according to the Worshippers of the Church Missionary Society, the same classification seems applicable to the Dorobo of the Guas Ngishu Plateau. I think myself, however, that the name means this dense little people, and is derived from a similar to the name given by the Kikuyu to a dense people in the Kikuyu country. Their name for the Masai—the word Ghoma means stubborn or, by a considerable stretch, little people.

Africa, East. With Plate M. Hollis.

126 **Some Dorobo Customs.** *By A. C. Hollis.* 101

I recently went for a trip through the little known country lying between Naivasha and the Anglo-German frontier, and was fortunate enough to obtain a snapshot of a Dorobo, who was a member of the caravan, spitting towards the rising sun before saying his morning prayer (Pl. M, Fig. 1). Whilst performing this ceremony he had to lay aside his sword.

The rains were overdue at the time, and I took photographs of the same Dorobo making medicine to prevent the rain from falling. Fig. 2 shows him whistling at and defying the rain-god. In Fig. 3 he has laid aside his bow, and whilst holding his sword upright is rubbing the handle rapidly between his two hands. This is done when the rain-god takes no notice of his defiant remarks, and looks on unmoved as the celestial water-cap. It is doubtless only a remarkable coincidence, but although the rain ceased threatening we had very little till we returned to the Uganda Railway, when it came down in torrents. All the natives of the caravan—Kikuyu, Kavirondo, and other East Africans alike—believed that the Dorobo had kept off the rain, and I was told more than once that if it had not been for him we should have been washed away.

● 197 It is worthy of note that I met some Masai-Dorobo in the Rift Valley who did not speak Masai like most of the Dorobo in both British and German East Africa. Whether their ancestors had never known this language or had forgotten it owing to long intercourse with the Masai, or whether they had been simply poor Masai, who, owing to the loss of their cattle, had become outcasts and taken to hunting, I was unable to ascertain.

THE SOCIAL ORGANIZATION OF THE DOROBO[1]

By G. W. B. HUNTINGFORD

I

The Dorobo, who call themselves Okiek, are a forest-dwelling people scattered over the highlands of Kenya and Tanganyika. Twelve groups[2] are recorded, and it is known that they are all hunters, and that all speak dialects of Nandi. The group which forms the subject of this paper lives in the North Tinderet forest to the S. E. of the Nandi Reserve, at an average altitude of over 8000 ft., and actually on the equator. In this area there were formerly six inhabited districts, called Kelpai, Kipkoreon, Sowiyo, Chepureur, Sirua, and Mokopich, while some five or six miles to the south there lived another group on Tinderet hill. My investigations have been limited to the first three of these divisions, since Chepureur, Sirua, and Mokopich no longer exist, and the remnant on Tinderet form a distinct group.

At least fifteen years ago the Dorobo were forbidden by the government to live in the forest reserve, which comprises the whole of their country, and those that did so, unless as squatters of the Forest

[1] The field-work on which this paper is based was carried out between May 1929 and November 1930 under a Leverhulme Research Fellowship, and I wish to express my gratitude to the organization for making the work possible.

[2] The actual distribution is: Kenya, 9 groups; Tanganyika, 3 groups. See [illegible] Roy. Anthrop. Inst., 1929, LIX, 230 and fig. 2.

601

601
197

MAWA—M.Br., M.Br.W. My mama, and possibly also to Boni *mama-ye*.

ITTO—M., M.Sis., F.Br.W. Nandi *ajo*, Masai *paipa*, and in most of the Nandi dialects for "mother." An irrational abbreviation for *ajo* in Dorobo *POEINE*, which in Nandi means Bro.SW.

AGWI—F.Br., his children and male children, Nandi *agui*, Masai *al-ahui-gwandikeben*. Cf. Boni *ahwe* < *hwe*, "boni."

EOEEO—F.M., M.M. Nandi and Masai *koko*, "old woman," i.e. grandmother. And cf. Masai *ang-kyko*, old woman.

POEEIT—F.Sis. This might be from a stem connecting to Boni *pak*, "grandson," but I think it is more likely to be a remnant of the original Dorobo terminology.

EOOYEE—F.Sis.H. etc. Nandi-Masai *mama* "woman," and cf. the Masai *ma a-kokoni a-ngaji*, "respected elders in law—Br.W. and W.Br.

EEEEO—F.S., M.F. Nandi *kei* is the same, form of *koko*, and *kwaye*="I mean," i.e. grandfather, like Nandi *ngoge kegogei*, the reference forms for *koko*, *koko*.

MAEOOEEO—F.S.S. etc. Still unchecked—S.S. and S.S. The etymology may be Low children, "widow," hence it could signify "a collection of relatives."

MAEOE EE—F.S.M. etc. Not a Nandi term, but perhaps of Nandi origin, i.e. *ma-ki-chet*, "They are not granted," because though their relatives are known, none can ever allow in one's life-time.

EOOOYO—Br. Sis. M.Sis.S and S. Nandi *chakwa* for Br., Sis., the true Nandi being *ngoket*. Possibly < Nandi *kwa*, "carry a

child,' a being one of the duties of a young girl to carry her small brother or sister.

AFAA—children of ego and ego's Br. May be connected etymologically with Nzadi *apa* —M.Sin.H., F.Br.S. (*an'-i-apa,*) meaning 'father,' and used elliptically in Dendo to mean '(children of) father.'

APULATTO—M.Br. < Mbuun *apala* < *apa.*

SUNDET—F.Sis., F.Br.W. < *sona* found in Mbuun *o-sudan,* 'sister to love.' *Sudet* (W.S.) is thus the equivalent of *pulat* (M.S.) and must mean 'one to whom respect is due.'

The Dendo normally live in family groups, either one or more elementary families or domestic families* forming an extended family, or one or more elementary or domestic families of fellow clansmen, e.g.:

The people under whose influence a child will come are these: in (1) (a): F., M., one of the 2nd ascending generation, F.Br., F.Br.W., with F.Br. S. and D. as associates. In (1) (b): F., M., F.F., and F.M. In (2): F., M., one of the 2nd ascending generation, with clansmen as associates. The people normally responsible for the bringing up

*Definitions of 'family':
Elementary family=F., M., and children. (S.F.)
Domestic family=a group of people living together in one house or enclosure, F. being on an elementary family, e.g. one husband, two wives, and the children of each wife. (S.F.)
Extended family=a group of families related by generation or collateral living together as a definable unit, e.g. Father, and one and his wives and children form a patrilocal extended family. (Bur. S.)

Ex. 5. Young Ideal. 5 and 4 para-Ideals, 3 mixed with Negro blood, 1 doubtful.

The Ideals's protected

who consisted of their inventors by giving up their roving life, whereas the Woodsmen, by sacrificing their lands, were able to continue their familial nomadic life as hunters and soldiers of fleas combat to forge the great dam.

[illegible] Even though, in general, one should be very careful in ethnology about drawing conclusions from linguistic facts, I cannot passionately here, on behalf of the three branches belonging to one people, to point to their language as well.

As a matter of fact, we find the same language among the Ideal and Tribual, with the insignificant for the latter, with the great number of Ideal dialects, sometimes this one, sometimes that one is their own, according to the location of their area, whereas the very widely ranging Ideal patently understand almost all the dialects. In addition, for the Tribual, in places, according to the degree of their mixture with Negro tribes, a language of the latter's is more or less familiar. Of the Woodsmen, the 8 generals speak only the language of the Ideal, whereas the 3rd and

/10 cont./

the Ik will also have their own views, which will be briefly discussed at a later place.

Corresponding to the uniformity in language, the native words on the move among the Ideri and Wekuri, whereas the Kuk and Ik will have their own words for only a few numbers, but in general always make use of the ones used by the other two branches. One finds a complete correspondence for all these branches in their religious rites, and the manner of circumcision customary among both sexes. The peculiar circumcision of the boys is practiced by no other people at all, with the exception of one lineage of the Tororo, closely related to the Ideri people. In birth and death, too, all these have the same customs, while in the rest of their customs one finds only unessential differences which are based solely on the difference in their external way of life. The sure existing proof for the three branches' belonging together, however, lies in their descent.

The people of a whole are divided into three large tribes, the [illegible] stem, the Ik mukiiyan, and the Ik sedigana, each of which is made up of a number of lineages, and every Kuk, as well as every Ik kuuk and Ik ssamani, is a representative of one of these lineages.

If we now concern ourselves further with the ethnography of the Ideri in particular, which is at the same time that of the Wekuri, we are thereby including the ethnographic traits of the entire people for the meeting of individual differences that have developed among the Wandaribe in the course of time and under the influence of changed conditions will be observed in the third part.

/11/ Second Part

I.

Tribes, lineages, sublineages. — The Ik gimit lineage. — The chief, his rule and policy, magic medicines, government men, village, ceremonies, feasts. — The ssaaman. — The Ik ikkuuke lineage. — The ssimiiyam.

Every tribe (ni gimiiyan) is divided, or has already been separated, into a number of lineages (ni gimiya, ni gimit). Among these, in turn, one distinguishes principal lineages (ni gimiya kuuk)

/Ibi nuki/

[illegible] The fact that in many things the Ani served as a model for the latter two and that the Ki still also often designate themselves as Ani follows from the circumstances. They are both mainly /Ibi/ humans, whereas among the Ki generally the tendency toward animal humanity has still been preserved here and there.

[illegible] In the following, for obvious reasons, only the Ani will be discussed. Therefore the accompanying native words have been taken from the Ani idiom.

The fact that the Ani are divided into the same tribes and languages as the Ikani and Wakuafi and that they also regard the [illegible] as their chief has already been mentioned at the beginning. It is to be

000 Language. -- Numbers. -- Times of the day. -- Designations of the closest days in the past and future.

• 197 The Aså speak two different idioms, namely, firs, depending on their place of residence, one of the dialects spoken by the Masai, and, secondly, a linguistic mixture that has become a separate "language." Its basic element is an older dialect of the Masai people, which in the course of time has acquired two admixtures. The older of the two stems from the Taveta language (1).

1. Probably also from that of another Semitic people already extinct, that is, through mixture with Negroes, disappeared among them.

1274 1277 1278 When the Aså migrated into the East African steppes, they found here the Taveta as livestock nomads and the Sawka as a poor hunting people who belonged to the Taveta people. The intercourse that arose between all these may have brought about the adoption of Taveta words into the Aså language and the transformation of Aså words into a form resembling Taveta. This process advanced further when the Aså were displaced by the second band of the Masai people, and the Taveta and Sawka, having become hunters in the meantime, became their teachers, who helped them develop from stock raisers to hunters. This Tavetaization of the Aså words is expressed particularly in the mutilation of the article and appending to the substantive one of the endings common in the Taveta language.

1279 1280 1282 Now, since the Aså to this day are in close contact with the Wakuafi and Wamasai, they also adopted words from them, i.e., words of the more recent Masai dialects and also words from Negro languages, which found entry among them through the Wakuafi mixed with Negroes. This is the more recent of the two admixtures.

THE DOROBO OF THE NORTH KINDIGA CLANS

[illegible] high straight and bushy, cropped on the temple. Bodies are also hair on the [illegible] Ilchoni, though it there is a long lock, they are tucked back.

Witchcraft

Witches, greatly dreaded as among the South, [illegible] are of either sex. Sometimes one path is the more common, though in 1938 the Dorobo said there were as witches as all in the three districts of Kapsir, Kapsowar, and Tambach, and probably as many of witchcraft was accompanied. Formerly, in cases of witchcraft, where the [illegible] child's disability was unknown, the Dorobo went to a Nandi diviner, whereupon each [illegible] on the disability knowledge (name) the witch was supposed to be the victim of the [illegible] curse, and fully with the list of a dis-grace. If the accused, who was told to a [illegible] by a Kalenjin diviner rightly named the confession and flogged the diviner.

Affinity with Wild Animals

Presenting a "hunting outlook," the attitude of the Dorobo to wild animals is [illegible] quite that of the African to whom hunting is a mere of providing [illegible] They seem to be closer to the wild life around them, perhaps because they are [illegible] and dependence. The conversation of Dorobo going through the forest name [illegible] to the wild life there, for they have other story and the Nandi and [illegible] with the Dorobo of the forest. This was described to a man, to which a Dorobo [illegible] "The Dorobo know the names of all the animals, and they like to see the animals. The animals are not hurt, for we and they all dwell in the forest together. The [illegible] game of animals is not like that of people, but it is not very different, the animals [illegible] are intelligent. All animals of the forest are alike, though we are many and are [illegible] animals, because we the Dorobo and they the animals all live side by side in the forest."

Musical Instruments

The Dorobo have no musical instruments, and they either sing or dance. They [illegible] used to have metal-back bells which were blown to call people together or to [illegible] forest.

[illegible]

Names

Before a child is born, the spirit of an ancestor is called upon, and the child receives the name of that ancestor, which is similar throughout the [illegible] tribes, a man becomes [illegible] name, [illegible] [illegible] a boy named [illegible] whose father's name is [illegible], becomes [illegible] [illegible], and a [illegible] [illegible]. Both the ancestral and family names are usually [illegible].

Circumcision. (Plate [illegible])

The customs connected with circumcision seem to be very similar to those of the [illegible]. There are ceremonies at intervals of about two years. The ceremony takes place after harvest, about [illegible], when every [illegible] [illegible] [illegible]. An animal sacrifice is performed in the early morning. In the case of girls, a circumcision is held when there are sufficient girls to a [illegible] of an age to be circumcised; only the clitoris is removed. Circumcision, or wearing the [illegible], and is [illegible] [illegible] [illegible] to marriage.

Marriage

It is usual for Dambo to have only one wife, as they are unable to support more. The price of a wife is paid chiefly in [illegible]. Before marriage the suitor gives to the girl's father an [illegible] [illegible] as [illegible] are very scarce.[1] He also gives the parents [illegible] [illegible] [illegible] and he must give his father-[illegible] [illegible] [illegible] [

[illegible]

6.

[illegible] Pregnancy. — Behavior of the pregnant woman and her husband. — Care and treatment of the pregnant woman, the woman in labor, and the woman in childbed. — Killing newborn children. — Fertility. — Child mortality.

[illegible] The opinion that the coitus heard expressed a number of times by the Yurok[illegible], that pregnancy is more or less bound up with a definite time of year, and, in the main, is such a way that coitus resumption takes place at intervals from a birth takes place at the time of the birthage of the possessor can [illegible] appears surprising.

[illegible] During his wife's pregnancy the husband does not [illegible] a great interest deal of is burning, because it is believed that the father, or his approach, will make the [illegible] and weight. Therefore, after he has died an animal, he moves to the camp and from there each another man are to look for the animal. The pregnant woman may not be beaten. Neither is [illegible] the pregnant wife may step over a [illegible] of [illegible]. She is forbidden to eat meat from a wild animal that died or was killed by a predatory animal, the [illegible] eggs, and [illegible] [illegible] which [illegible] has [illegible] on [illegible]. She must avoid [illegible] [illegible] a [illegible] or a [illegible], or [illegible] toward [illegible] the sun for any length of time. [illegible] this, in the opinion of the [illegible], would [illegible] the [illegible].

If the woman [illegible] another [illegible], she [illegible] her husband with [illegible] [illegible] [illegible] to [illegible] [illegible] the [illegible] [illegible] to [illegible] [illegible]. [illegible] the [illegible] [illegible] [illegible]

were having a meeting of any sort, however informal, at which they wanted to speak of anything important, they were careful to exclude Dorobi from it; and if a Dorobi insisted on intruding, they would talk only of trivial matters till he had gone. One day when I was talking to some Dorobo about their land, they insisted on my sending out of earshot a Kenyi who was with me — they even took me out of his sight and spoke in low voices, for the subject was too serious to be heard and perhaps ridiculed by a Kenyi. It is thus not difficult to understand how an acephalous horizon like the Dorobo can fall into chaos, and this is what I believe has happened among the Dorobo. Pressure of various kinds was by 1937 forcing the Dorobo to be more wary than ever, and the clan system could give them all the administrative organization they needed. Hence the local council could lapse, and with it the office of Kiruaktuk (though the term names remained), so they lost become useful terms of reference.

Nevertheless, the local council is clearly associated with the punishment of crime, and it is therefore necessary to understand something of the way in which it did its work to this end.

All the elders and circumcised men of a district formed the council. They met at the foot of a tree where the undergrowth was cleared away to make an open space. Any tree would do, for unlike the Kenyi they had no special trees which mark the demand. The functions of the local council were described briefly by a Dorobo in the following words: Kimos sabik ai ilosi ne ninyae ak ai yae, ai ilalae ghi nabat. Ingoroi ak ake nabat, ilosi ai ilae ewai ake. "We take counsel that we may find what is good and leave what is bad so that all men may understand. If any man refuses, he is driven out of our country". Questions of theft and homicide were discussed by the council. It established what steps to take when land was sworn, and disputes of all sorts between people of different clans were heard and settled. The decision of the council was announced by the Kiruaktuk, who after hearing the opinion of the meeting, would stand up and say what ought to be done. It was then left to the people concerned to carry out the suggestion, for each it was, in effect, rather than an order.

The way in which the law is enforced is liable to be something of a puzzle to the casual observer. The belonging of Dorobo political organization in public opinion, and behind public opinion is the fear of the dead. People know that it is wrong, that is, contrary to custom, to do a certain thing. They know also that if they do it, their friends will do something unpleasant to them, and, what is really more important of all, they know that sickness connotes, "the spirits of the dead disapprove". Hence in order to understand how Dorobo law works one must know something about their religious beliefs. To the European these notions are double Dutch, but they are effective in that the Dorobo have been able to survive till to-day as a unit sufficiently law-abiding to hold the area and carry on its existence in face of human and non-human enemies, and to maintain its place as a living organization.

Among people like the Dorobi, the council habit has become an almost daily business, but in fact almost none is to the equivalent of a club, though without the accessibility of a club, but this is not possible for people who

FLA Dorobo FLA

Some African Folk-Tales, Folk-Lore and Superstitions

"*Epiko kimoko kitii*" [1]

Time surveyed a Wakiwi Dorobo whom I called on his silence and attitude of strained attention during a halt by the wayside when on safari in the remoter areas of the Tanganyika Masai Reserve.

The bush and what can be wrested from it—wood for his bow and arrows, honey for his wife and children and for barter, the bark of the *Olmukutan* [2] tree, fibre for plaiting into his hair, and last (but most important of all) the skins and the meat of game animals—these things bound the horizon of the Dorobo. It is therefore not to be wondered at that such folk-lore tales as exist among the Dorobo at the present time are chiefly concerned with animals and animal life. Similarly, the paramount interest in life of the Masai is apparent from a study of the extant folk-tales of that tribe, which deal, to a great extent, with cattle and other domestic stock. The tales one hears told to-day are, in all probability, but a few of the more easily remembered of a host of stories now forgotten for all time.

The following examples have been selected from a large number of stories told by the Wiwiro themselves and admitted by the Masai to be Dorobo in origin.

The Child and the Elephant.—The Child, when out walking in the bush one day, chanced to fall over a piece of elephant-dung in his path. This made him very angry and he said: "How am I recommended by the dung of the elephant? I am so small that I cannot hope to accommodate him in the morning, but I will arrange for all the members of my tribe to come and make use of one piece, and then in time the long may grow big enough to trip a passing elephant." This is the reason why piles of child-dung, showing that many of them animals have used the same place, are often seen in the middle of a bush path. (A story very like this is told by certain Central tribes.)

The Tortoise, the Hare and the Hyaena.—These three made an agreement to rob a rich snake. The latter had cattle and

THE HISTORY OF THE SOUTH AFRICAN SHORTHORN

Introduction

The Shorthorn breed is unknown to a small area about 30 years ago but today is widely spread and at that has grown very popular. Though other individuals have a Shorthorn with economic usefulness and unknowable to the development of cattle breeding as a primary activity and they have been formed in cattle agriculture a primary function for the carrying, transportation, and even the meat used to this, they have been rendered to the breed.

Breed

There who live in 2 and 3 Rhodesia categories (with whom there are not considerable) have cultivated small plots to the open land which surrounds the forest. They have no rights of tenure except the temporary ones granted, according to Europe law. If they live there in accordance under the Rhodesia Native Locations Ordinance. Their plots, consisting of approximately, range in size from one acre divided into four cultivation holdings. A half an acre divided into four holdings. In other cases, plots of a quarter to one-fifth of an acre worked by one person. All plots are fenced, and establishes a living that is left inside the fenced area, economically it was found that allowing Rhodesia crops offered by Rhodesia agriculture to have a little piece of their agricultural land to work.

Europeans farmers in the district, with whom the Rhodesia land practices near the reserve, showed not unwilling to let the Rhodesia live considered on their land give other than piece on rentals, but the government authorities thought otherwise, and the practice of a Rhodesia who did not choose to become a squatter in order to live on what he considered his own land was thus prevented.

Cultivation Methods and Crops

Two main crops are grown, viz maize, groundnuts and native vegetables. Other food are being grown by white though they brought it from the Rhodesia. Owing problems, especially the cultivation grown in very limited quantities. Implements are the hoe, digging fork and the panga or cutlass, both obtained from the Rhodesia. They have also small axes, which are known, known as pangolabas.

The planting of crops is regulated by the dry and wet seasons, experiments from October to March, and hoed from April to September. The land is prepared between January and April, and planted in April or May according to the rain. Cultivation follows the Rhodesia method, with planting and hoeing of one hoed. The seed of maize and beans is brought from the Rhodesia, usually from squatters living nearby. Maize and beans are planted together in the same plot, though groundnuts are generally grown separately. Manuring is unknown to the Rhodesia cultivator but certain of the native seeds is grown by hand. Cultivation of Rhodesia crops are considered small, but are certain crops in the plots are so small that the bulk of a few such generally both of this is on sandy on the field are to allow the rain with weeds. Cereals are roughly grown on plots of ground in the Rhodesia cultivation.

Stock

Stock is the only form investment worthy of more consideration by Rhodesia, and vegetables, and goats bought by exchange from the Rhodesia. The food supply is still based on their own agricultural practices, supplemented by work grown from their own, and by goods from South Africa they can be got. Meat is still consumed by trapping, though cattle by hunting, it constitutes the diets of privileged members only, and is limited. Stock is got by bringing down from heavy forests. Milk from cattle and is the most valuable food of the Rhodesia native children, sometimes obtaining pasturage, and cannot obtain cattle with tuberculosis, the egg of the dairy and the cow is rarely kept.

Approximately 50% of the Rhodesia Native area, distributed in families of 5 each, have their money, and investment with the long established of the [illegible]

The Dorobo divide the year into two parts, Kiwiswosh, the dry season, when they used to go hunting the bigger game with bow and arrow; and Iwet, the wet season, when they set traps. Both seasons covers roughly half the year, the rains beginning to set off in September and getting fast and fast in January, and then starting to work up again in March, reaching its peak about May; so that Kiwiswosh comprises our months of October to March, and Iwet, April to September. The Dorobo have twelve months, all but two having the same names as the Nandi months, but they do not synchronize.*

Dorobo names	Nandi names

Tcheet	Kiptaloi arap	September

The average rainfall at Kapchorua Farm, about two miles below the edge of the forest for the years 1931 to 1937 was 61.71 inches, the maximum being 80.17, the minimum 36.10. Details are given in the Appendix. In the forest itself I think the rainfall is considerably a little higher, perhaps amounting to another 5-6 ins. to the course of an average year.

The Dorobo seem to have a better reputation even than the Nandi, and I found that they were generally accurate when making a forecast, whereas the Nandi are usually wrong when they try to forecast the weather. This weather sense is perhaps one of the reasons for their reputation among other tribes as rainmakers. For these Dorobo not only say that they have no rainmakers, but I could find no trace whatever of rainmaking activities, and any man that they ever had any. Obtaining weather-lore are such, however, that to a farming economy rainmaking is not a necessity.

The environment of the Dorobo provides them with food, drink, meat, and other vegetable materials. Also they had salt, and they still have an knowledge of manufacturing, though they use iron implements. Their activities comprised hunting, trapping, food-gathering, hut-building, the production of honey, and the making of objects of wood, leather, and grass, such as traps, grass shields, honey-boxes, clothing, rugs, baskets, and bundles for both. Objects of iron they have got for as far back as they can remember from the Nandi, by exchange for such things as they can make or produce themselves.

* Throughout this paper I have written the vote used by the age a represents the 'long vowel of', for which another * the first occurrence in the vote used.

The year was divided, from the hunting point of view, into the dry season and the wet season. In the wet season people did not generally go out hunting, but stayed at home and set traps to catch antelope and the like. In the dry season they hunted all sorts of game with bow and arrow in the forest and the uitdil. Thus, Kxoe Bloke told of how once after he had been circumcised he was one of a hunting party that went into North Kwalk, as far as the hills Kaptoye and Tgwaatse[1] near the modern Tsoha, some forty miles from the forest, in the days when there were no Europeans there, and another Dombe spoke of hunting monkeys as far from home as Kaptoye in North Kwalk. Leopard, monkey, and pig are still plentiful. Buffalo still exist in the east, in the direction of Tsabbesa and Lambian, but they have now been hunted by the Dombe to recent years to fact, they say, not since about 1900 when the Kaptoye age were members. Elephant are no more, but they were found in this area, according to some old men, when the Kxoe and Kaptoyen were warriors about 40 to 70 years ago. There are no lion in the forest, but the Dombe occasionally shot them in the plains. Leopard used to be hunted by organised parties, but this practice has been discontinued for some years, though they are still attacked and killed by individuals if they get aggressive, as in February 1935, when Kxoe Diagna got his leg torn in a leopard trap at Nxabiya. Sometimes traps are made for them, of wire which is pinned up on the fence. But trapping leopard is not common, and the trap made by Kxoe Bloke which caught a leopard in July 1938 was said to be exceptional. Generally they prefer to hunt a leopard with dogs, as in the old days, when if one was put up by a dog and climbed a tree, the hunter came and shot it.

There is really no close season, as we understand the expression. The trapping season, which did in fact give the game a respite, was not observed for that purpose, but was for the convenience of the hunter themselves, because when it is wet, the forest is difficult to go through, the undergrowth thick, and the ground muddy and slippery. Though some have become to hate pig there is no taboo.

Hunting equipment consisted of a bow, poisoned arrows, quiver, knife, and dogs. Spears have never been used by the Kxbunkwe, and the spear may imported as he found among some Dombe does not appear ever to have been one of their methods of killing big game. For trapping a man would only something to set the mechanism with, and, of course, his skill. A dog is to make a girl-trap to work something to dig with.

Bows are made mainly from the Dombe tree (Dombe sp.) and are about 4 ft. in length. A suitable piece of wood is cut and scraped with a knife-blade till it is smooth and of the right thickness. The bow-string, too, is made of gut from the giant pig, [illegible]. The gut is scraped, greased and rubbed till it becomes sufficiently strong and pliable for use. It is knotted to the ends of the bow so as not to or so from each end: an notch is cut in the wood to receive it. Arrow-shafts are made from the [illegible] and reeds-trees, as well as from [illegible]. They are smoothed with a knife-blade in the same way as

[1] Kxoe names, as Europeans or Kbalkwa and Kxoegan.

Fig. 5. A Simple Kind of Spring. This trap has an "elegant grip". The animal knocks on the platform and by so doing presses it against the weight A, to which base B is attached, thus releasing the bow and allowing the bent stick D to spring upright and tighten the wires round the neck of the quarry.

when an animal knocks on it, allowing the bow to slip over the top and thus release the bent stick D.

Snaring parties might be made up for as many as eight days, though I think that probably four or five was a more usual number. A common practice was for half the party to work along one bank of a stream and the rest along the other bank, so that if there was nothing on one side, there on the other side might be more success[ful], or if the quarry got across the stream, the men on the other side would be able to deal with it. When a kill was made, all the hunters assembled. The animal was dressed, the meat cut up, and some of it eaten on the spot, either raw, or partly cooked by laying it across a rough wooden framework over a fire. The rest of the meat was divided among them and taken home. In the bad days, when meat was plentiful, what was left over was dried and kept either on a reserve on the exchanged with the Kwadi for skins and millet. A stock of dried meat [illegible] about 3 lb. square, was sold for about 30 lbs. of grain. Meat is not [illegible] etc., whereas carbonated which are held over on the drying tray or left over the fire to be smoke-cured when being dried on the roof of a hut or in the bark of a tree.

2. Agriculture

Since they are no longer hunt, and present conditions are[1] not favourable for the exploitation of cattle on a large scale (even if the Swede had the means of so doing), the adoption of agriculture has become an economic necessity, and methods, implements, and seed have been obtained from the Kwadi. This change from hunting to agriculture has taken place virtually between the years 1931 and 1948. In the first of these years the only cultivated by them was so small as to be negligible, but by the latter year their fields were, as we have seen, in a great deal cultivated as agriculture. Just as with hunting in the old days, so with agriculture to-day, the planting of crops is carefully regulated by the sun and the moon, [illegible] The principal crops are:

[illegible] to April:	groundnuts of the bush
April–May:	planting
September:	reaping

[1] See notes to the years 1931–48.

S. Migeiro G-4 (ca. 1926) 1927-28
FLA Dorobo FLA

function of which is to borrow cattle to its multitudinous and the scarcity of the cattle's keeper.

The Masai are good to the Wakwafi and seldom refuse them a share in whatever food is obtainable—be it milk, meat or grain. The Wakwafi expect this; in fact, many of them seem to look on the natives from the Masai as their right. The reason for this is stated to be that the Wakwafi helped the Masai on many occasions in the past (particularly during the great rinderpest epidemic in the early 'nineties) by hunting for them when starvation had overcome the ingrained antipathy of the Masai to natives. In addition, before the coming of European rule many elephants were killed by the Wakwafi at the request of the Masai. Lekiro told me of one drive in which he and about thirty Wakwafi were engaged during which sixteen elephants were killed.

When a Wakwafi obtained cattle he sent, unless restrained by his more prudent friends, to slaughter and eat them in the shortest possible time. Up to quite recently, a beast was valued by the Wakwafi only for the amount of meat it was capable of providing, but nowadays a few of them are beginning to herd cattle in a small way and some even live as Masai. It is interesting to note that many of the older generation, particularly the women, profess an aversion to having cattle in the vicinity of their own dwelling or sleeping places.

A few Wakwafi till the land, but in a half-hearted way. They are extremely improvident and prefer to risk almost inevitable famine rather than to exert themselves in cultivating grain. They never expect their women to work in such small plantations as they may have. A Wakwafi will cheerfully tramp the bush for a week or more, picking up a most precarious existence on tubers and roots, and will consider himself well repaid if he returns with a few pounds of honey. He will be horrified at the idea of putting in one hour's work each day on a sensible patch for the same length of time.

In the bush, very little in the way of food comes amiss to the Wakwafi. Failing meat, his favourite food is honey, but this is reported as a delicacy and would be eaten wholesale only under the most exceptional circumstances. If meat and honey are unobtainable, the Wakwafi has at his command an extensive

2:Migotos G-5 (ca. 1926) 1927-28
FLA Dorobo FLA

knowledge of roots, leaves, berries and tubers of all kinds, on many of which he is capable of supporting life.

Various kinds of honey are obtained in large quantities and they command a ready sale among the Masai, who are, for the most part, too indolent to look for honey themselves. The *Mósiro* are greatly assisted by the honey-bird [1] in their search and do not appear to suffer much inconvenience when stung. The honey is generally removed by hand, the despoiler working placidly in a cloud of angry, stinging bees. Occasionally a tree has to be felled, and in some cases the honey may be so inaccessible that fire has to be resorted to for the purpose of driving the bees away. Thick clouds of smoke are readily produced by the use of the *Endoisi* [2] which every *Mósiro* carries in his quiver.

With regard to the dress of the men, the *Mósiro* are seldom to be found wearing skins. I have seen *Mósiro* wearing a single garment of rough bark-cloth, knotted at the shoulder in the manner of the Masai blanket, but as a general rule their dress consists of a ragged strip of "Amerikani" or blanket, weather-worn in the extreme, tied over one shoulder and confined at the waist by the sword-belt. They say that they no longer wear skins because the latter make too much noise in the bush and lessen their chances of approaching close to game. The women wear a skin garment [3] of the same kind as that worn by the Masai women. They also wear anklets and armlets of wire, but the heavy iron necklaces and *sarutya* earrings of the Masai women are seldom, if ever, seen. It may

[1] *Cuculus Indicator*: a small drab bird about the size of the th- h. It has a short, but very sharp, bill, a white underside and black-striped -tage. Its distinctive twittering often heard in the bush, particularly in the vicinity of bush-pools and other places it favours are likely to be frequented by humans. It flies from tree to tree, keeping up its twittering all the time, and is obviously anxious to be followed. I have followed this bird several times, and although honey was not always found at the end of the trail, it invariably led us to places where bees were or had been some time before. The *Mósiro* always answer the cries of this bird, even when they have no opportunity of following it. There are many legends about the honey-bird, which, I think, is to be met with throughout East Africa. The Swahili call this bird *Sapi*; the Masai call it *Ee-pidoto*; the *Mósiro* name it *Chelemdet*; the Nandi, *Chepkondo*.

[2] See the section devoted to Dorobo arms and equipment.

[3] *Olokeenik* (Masai).

FLA Dorobo FLA

mind) made by placing the forefingers on either side of the nose and calling into the hollow formed by the palms of the joined hands.[1]

The *Médivo* are fast and accurate bowmen at close range, and there are few of them who have not accounted for more than one lion with this weapon. A *Médivoi* at present in my employ is credited with having killed thirteen lions thus, three of them with one arrow. The arrows, of course, are poisoned,[2] and are discharged with a force that would, I feel sure, excite the admiration of a European toxophilite. A curious, crouching attitude is adopted when drawing the bow-string and the archer faces his target, not adopting the more usual position of standing at a right angle to it. The killing of a lion with the bow is not regarded as an event of especial importance and the carcass is often left to rot in its skin.

If trouble is in the wind, the *Médivoi* will always make for the haven he knows best—the bush. There he will live, apparently quite independent of the products of civilisation, and in nowise inconvenienced by a total lack of water, for weeks at a stretch, returning (when the trouble has blown over) with a skin bottle or bag bulging with honey. I could not understand the apparent ability of the *Médivo* to live for long periods in country I knew to be waterless until I had been introduced to what they laughingly said was "the dry-season water." This is an enormous tuber[3] with a skin like the domestic potato. Under the skin is a milky, sticky layer about half-an-inch in thickness. This surrounds the inner core, which is of the appearance and consistency of a raw potato, is slightly fibrous and very moist. When this is chewed (the residue is not generally, but may be, swallowed), it gives great relief to thirst. Squeezing or pounding one of these tubers over a cooking-pot will result in the accumulation of a surprising amount of quite

[1] My predecessor at Kilaya shot two male lions which were "called" to a kill in this way by the *Médivo*. He sat beneath a tree at a place where two lions had recently killed; the *Médivo* mounted the tree and began calling. After a short time, one lion came to the kill (a goat) and was shot. The second lion came quite soon afterwards and was duly given his quietus.

[2] See the section devoted to Dorobo arms.

[3] This tuber, called *Kichevenduwa*, is also known to the Kitito Masai and is called by them *Ol-kisordowa*. This is a corruption of the *Médivo* name, and the Masai freely admit that they learned of its existence from the Dorobo.

Ambulatore G-5 (ca. 1926) 1927-28
FLA Gwynne FLA

palatable water. A full-grown specimen of this tuber must weigh many pounds, as I have seen them as large as a Rugby football. It is most difficult of detection, having only three or four small oval leaves above ground, but the *Mbiru* seem to be able to find it anywhere. It is generally obtained by digging with a sharpened stick under certain bushes.

The majority of the *Mbiru* (if not all) would seem to inhabit the southern half of the Tanganyika Moani Reserve. There are a few living in Shankoni, but close to the southern Moani border and within a day's march of Talumni. North of L'ul-Kimbi I have not met with *Mbiru*, though I think there may be a few in the northern areas. There are some *Mbiru* in the vicinity of Lo-'ndumni. I imagine (though I do not assert positively) that the Dorobo living with the Moani west of the Rift Wall, in the Kutu-'m-beine localities and to the north of Lake Eyasi, are not *Mbiru*, but are *Aramanik*.

Many *Il-Mbiru* are members by adoption of the *Il-Aiso* and *Il-Mildyan* clans of the Moani, and some have been adopted into the *Il-Marumma* family of the *Il-Matkyan* clan.

Since the above notes were written, I have met with certain *Mbiru* whose housing methods are even more primitive than those already described. These people live in unpleasantly odoriferous "dug-outs" about eight feet below the ground. There is no ventilation, and the cave is generally scraped out beneath the roots of a baobab or other suitable tree. At night the entrance is securely blocked with thorns. The *Mbiru* who live thus differ in no other respect from those already described and, amusingly enough, are much despised by their relatives for their troglodytic existence.

R. A. J. Maconie.

[illegible] (1) [illegible] (1952) 1927-28
[illegible]

[illegible] women and they were. Now we live with our cattle like the Masai." This account is far from enlightening, and when Gerhola states that the *Aramanik* live as Masai, I fancy he is making too sweeping an assertion. Admittedly, the *Aramanik* of Meiye live as Masai, and so do many *Aramanik* in the central areas of Tanganyika Mandated, but I suggest that the Dorobo living at the north end of Lake Eyasi and those on the Serengeti plain (north-west of the Ngorongoro basaltine), who live a purely bush life, are also *Aramanik*.[1] Lekito was positive in the assertion that all the Dorobo living as such in the northern areas of the Tanganyika Masai Reserve and, furthermore, all the Dorobo in the Kenya Masai Reserve,[2] are *Aramanik*. I have had no opportunity of testing the accuracy of this statement. However, I do not think it likely that there can be yet another type of Dorobo unknown to those individuals from whose information the present notes have been compiled. If my assumption be correct, I think it may well be that *Aramanik* and *Dalekye* (the latter possibly under a different name) constitute the bulk of the Dorobo in Kenya, and that the Dorobo inhabitants of the northern areas of the Tanganyika Masai Reserve are almost all *Aramanik*.

[illegible] The *Aramanik* at Meiye are not fishermen. They do not eat fish, but they are very partial to the meat and fat of the hippopotamus.[3] They do little hunting nowadays and are, both young men and elders, rapidly becoming indistinguishable from the Masai. The *Aramanik* living further north (notably those to the west of the Rift Wall at Sonjan, Salei and Poltyet) live a bush life of hunting and honey-gathering and are not above shooting a Masai ox when the chance presents itself.[4] They are extremely shy people and I have had little chance of establishing contact with them.

The most remarkable thing about the *Aramanik* is their language. It is guttural in the extreme, and while there would seem to be few of the characteristics of the Masai or *Mbiire*

[1] See p. [illegible] *loc. cit.* The Dorobo seen by Sir Claud Hollis may, alternatively, have been *Aramanik*.

[2] About 500 in number.

[3] I have been unable to discover a single individual among the Masai and the Dorobo of all kinds who does not regard the eating of fish as anathema.

[4] According to unauthenticated statements made by certain Masai.

[illegible] or whether they are in closely connected as the Wakwe, Wakkul and Kisankasa, I am unable to say, as I have had little opportunity of meeting them or of making inquiries about them.

[illegible] The Kitobondo and Kisongore live in the country of the Wongoo and Wanjasa,[1] and are stated to have lived always with or on the outskirts of these Bantu tribes. On the formation of the Tanganyika Mount Kenya to carry the Wongoo and Wanjasa inhabiting the Tabaout-Uru Mountains were moved eastwards. With them went the Kitobondo and Kisongore. Ramogi says that many of them would have preferred to remain in Mumbuni where honey is plentiful, but their Bantu masters were adamant and insisted on the Dorobo following them. The Kitobondo and Kisongore, dependent for the necessities of life on the Wongoo and Wanjasa (particularly in a bad season when honey and game are scarce) were perforce.

[illegible] The Kitobondo and Kisongore spend a considerable amount of time in the bush, honey-gathering. They are entirely ignorant of the Masai language, as a general rule, but know Kisongo and Kisiqua and often both. They are stated to have a primitive tongue of their own, but on this point I am unable to speak definitely. It has also been said that some of them speak the Wakwe language, and although this may be the case, I am inclined to think that the presence of a few Wakwe, who live in scattered settlements just on the Elgeyo-Masai border and who cultivate small gardens of maize and millet, may have given rise to this belief.

[illegible] The Kitobondo and Kisongore Dorobo may be impoverished Wongoo and Wanjasa, but I think it more likely that they are Wakwe [2] in origin. There would seem to be little reason for an agriculturist to turn into a hunter.[3] The few Kitobondo and Kisongore I have seen differ entirely in general physical characteristics from their Bantu neighbours (who do not admit consanguinity with them), and their speaking only Kisongo or

[illegible] They are the names current among the Masai and the Dorobo in Mumbuni, but it may be that different names are used in the Elgeyo country.

[1] To the west of Mumbuni Station in the Pangani District.

[2] Perhaps it would be better to say Elgeyo.

[3] (But is not this the case with the Bakwikhani in South Africa, stated on good authority to be impoverished Bechuana ?—A. W.)

covered with a strip of soft hide—often that of antelope or [illegible]—studded in a state of plumpity resembling that of [illegible]. The back is never coated with gutta-percha or [illegible].

A small supply of bark poison (ipanema?) is sometimes carried in the bed of the quiver. This poison is a black, sticky mass made by boiling the leaves of a certain tree and is manufactured exclusively by the Wakondo. The Dondo have nothing [illegible] about it, but it is considerable use, and have some stratagem to make poison of their own.[1]

In the quiver is also carried a five-stick (di-kondgwe) and a five-hook (ensenda). The Dondo are experts at making fire and score in one minute. A small flat spoon (kandikwata) for measuring poison on the arrow-heads is also carried—this spoon is made from the same wood as the bow; and a small knife for smoothing and rounding the arrow-shafts. This knife is called ensele ekiti.[2] A wooden tube about twelve to eighteen inches long and a quarter of an inch in diameter, not unlike a pandeandan, will always be found in a Dondo quiver. This tube, called mabaka, is used for drinking from pools which are shallow or which have a dirty, swampy surface. (It is a point of honour with every Dondo and an unwritten law that a man should not stir up the mud in any water at which he drinks.) The mabaka is also used to inflate, by blowing through it, a blow or shield of skins from lighted grass put into a hive to drive the bees away from the honey.

A Dondo quiver, as we have seen, contains a large number of objects essential to the bush life that the Dondo leads. It is scarcely to be wondered at, therefore, that it is next to impossible to purchase a furnished one. A Dondo once told me (I am sure he meant it) that he would not exchange his quiver and its contents for five cows. The price habitually paid to the parents of a girl taken to marriage is from two to five arrows, and a demand on the parents' part for a full quiver would be regarded as extortionate.

The Dondo may be seen sometimes with a small axe which

[1] That is, arrow poison. The Dondo are reputed to have a powerful poison they use with skill. When hunted, it is stated to have a fatal result. I have been unable to obtain a specimen of this poison and doubt its existence.

[2] Literally, "dwarf-sugar."

getting his position through the luck recognition of the people. The Iwata therefore consists of a loosely integrated group of farmers that together quickly because they "are all friendly", but might seem by the non-existently which connects across the diverse boundaries. The men in this is the more important institution than it is among the Iwata.

The Iwata are a hunting people who have been forced to take up agriculture, and at the same time are in process of acquiring a small amount of rice trade. A great deal of their culture and some of their language have been borrowed from the Iwata, but their habits and mental characteristics are their own, including a "hunting outlook" which contrasts with the "cattle outlook" of the pastoralists, and a feeling of sympathy with wild animals that does not exist among other pastoralists or agriculturalists. Trust in happiness by hunting more here, and history in ingenious means as pastoral people regard cattle.

Although the Iwata are commonly thought of as a people who practice or still observe them is gone, this notion is true only to a limited extent. Fishing used to go for which is the all have nothing game outside their own territory to the upwards inhabited areas of the highlands, but that was never true and still is divided into strictly observed economic areas where an family holdings to which people have, on trips, long their lives, and other vegetable food. There were may both small on the map, but anyone who thinks that half an inch on a map representing perhaps one mile on the ground) across a very short distance, and that when he gets to the Iwata that one mile on the ground is a very considerable hour offering all sorts of possibilities for the hunter, and infinite dreams for the stranger to lose himself.

[illegible] who stands to the relation of father's brother to the youngest members of the group, as in the diagram of Fiji's family above, by which term any of children have a father's brother living close at hand. In a step group there might be no father's brother actually in the settlement, but often he would not be far off, for the tendency is to settle in brother groups and not isolated in the same manner as among the Fijians, where a family may live alone without having part of a settlement though still a member of the parish. This point is important, for the father's brother plays the same part to a [illegible] as that the mother's brother does among the Fijians.

The family, consisting of father, mother, and children, lives in close contact with one or more families, and sometimes includes the husband's father or mother (I have known as many others both alive together). Three families give the Dravida child his first experience of human beings. Kinship ranges are determined to a certain extent by environment and one of this, for under these conditions and a hunting economy the father is of necessity away from home a good deal, and young children are much in the society of their mothers and the other women of the settlement. This of course is true of other types of society; but in a pastoral society such as the Fijian, for instance, the father is not, under conditions of ordinary life and his food supply, obliged to go away from the homestead if he has [illegible], and there is no doubt that a Dravida child of twelve years has much less of his father than a Fijian child. When food must be got as it is needed, and when it is scanty or difficult to win, the father, on whom falls the duty of getting it, must be away much more than the man whose crops are close at hand, or whose cultivation produces a crop which is not given.

[illegible] Till a child is weaned, which may be at the age of twelve months or thereabouts, it is in closer contact with its mother than anybody else, and the father leaves it more or less alone. When the mother has to go out to do her share of food-getting, the child is left at home in charge of its elder sister if it has one, or with its father's mother; failing these, some woman or girl of the settlement will look after it. A Dravida mother cannot take her baby with her when searching for vegetable food in the forest, for it cannot conveniently be carried on the back in such surroundings; nor can she, like the agriculturalist, lay it down under a tree while she works, because it would not be safe to do so in the forest. This habit prevents trouble, and even when a woman goes to work in her shamba* the baby is left behind in somebody's care. But a woman's food-questing is done much more quickly than a man's hunting, and she is soon back at home; the shamba, too, is not so far away that she cannot get back to the child quickly if need be.

The attitude of a man to his wife is profoundly affected by physical and environmental conditions. The shortage of women and the difficulties of getting a wife (especially when wives are becoming the exclusive of [illegible]

* The Swahili word shamba = cultivated land, field, farm, is current throughout Africa. Here it is a shorter and simpler word than the English equivalent, I shall use it in the sense of a plot of cultivated land.

[illegible] extract part of the core and remove [illegible]. Moisten and pulp the [illegible] bark in cold water. Separate [illegible] as the [illegible] and [illegible] are [illegible] and split to the open country was the forest. Investigate [illegible] travel, for they are not as plentiful as they used to be.

[illegible] is produced in heavy harvests. This experiment [illegible] used at [illegible] 6th, and will be described in [illegible] below.

With vegetable [illegible] which grow in and invade the forest are those [illegible] and are as edibles or additions to the staple diet of [illegible] people. The [illegible] of collecting vegetable food is usually performed by the women. Provided with [illegible] knife an

[illegible] of the most plentiful [illegible], [illegible].

[illegible] of the wild [illegible], eaten in place of [illegible] the [illegible] and [illegible] or [illegible].

[illegible] may be collected by [illegible] a flat piece of wood [illegible] [illegible] [illegible] to the [illegible] of the tree – a [illegible] is [illegible] at the end of the wood and [illegible] for the sap to drip into it. The [illegible] of the wild [illegible] is very [illegible] for the [illegible] [illegible] is placed on the drying tray [illegible] over the fire till it is roasted by the heat, and is then broken up with the [illegible] and [illegible]. It is very [illegible]. Potassium is brought from the [illegible].

[illegible] [illegible] [illegible] [illegible] through the [illegible], the [illegible] [illegible] a substitute [illegible] the leaves of the [illegible] [illegible] [illegible], or of the [illegible] tree. Leaves were [illegible], and the ashes collected in a [illegible] receptacle, a little water was poured on them and mixed, and the resulting [illegible] was added to food as needed. Some of the [illegible] [illegible] used to make a similar substitute for salt.

[illegible] [illegible] [illegible] is chiefly made of honey. Enough [illegible] a [illegible] [illegible] is made in the [illegible] manner. The [illegible] method of making [illegible] or [illegible] salt is, "honey-wine", as as follows. As a [illegible] against the [illegible] of the natives [illegible] [illegible] [illegible] or the [illegible] tree, which [illegible] for an [illegible] as a [illegible] [illegible], are [illegible] [illegible] quite soft when they are cut into strips and put into the [illegible] to make it [illegible]. A [illegible] description of the process of making the [illegible] is the

[illegible] [illegible] [illegible] [

Fig. 1
[illegible]

[illegible] of termites, which are often found in their eggs. These birds in particular are said to be fond of eating bees; a small brown bird called [illegible], a small green bird called [illegible], and a small black-and-grey bird called [illegible]. The honey bird, [illegible] when harassed, and when it says that like a bee people have that here are there. This is the bird which many Africans follow when they are looking for wild honey. The Kamba regard it as an enemy of the bee because it gives away their secret hiding-places; bullet ants generally eat the eggs and grubs [illegible] to the hornets, they as enjoy other grubbing or [illegible] down to it, [illegible] to protect the bee beyond the observance of certain rules regarding the eating of honey and the disposal of the comb.

The Kamba say that bees have their enemy by the smell of their bodies, and that for this reason people are wrong that birds when they take honey from their nest honestly. But if a stranger tries to steal honey he is not [illegible] and gets stung badly. People state also to be able to recognize their own bees, for it, as they say does happen, other bees settle in the hives along with the original swarm. They can distinguish the original bees by their colour and the part of the hornet they enter. Whether or not this is true, bees and hornets very much. And there seems to be some truth in the statement that bees leave their enemy, for I have seen Kamba who have enticed the grasshopper pot on by a Europeon for the purpose, and proving fair trick and with an ill effects from the live stings they did receive.

When a hornet is put to a tree in the forest, it often has to be high above the ground, when many of the trees have no branches near the ground, and to help the person climb a sort of ladder made of a number of thin poles bound together to lend beauty to the tree trunk with bark (Fig. 2). To get the hornet to the tree, and to take honey from it, the Kamba has to climb this crazy ladder which looks as if it would slip or break with each movement, but somehow does not, and lasts rather surprisingly, for quite a long time. To take honey, the Kamba makes fire to a near bundle of [illegible]. When he has got it smouldering, he takes a bunch of leaves (preferably of [illegible]), fills up [illegible] and putting them and the [illegible] inside his garment, he climbs up to the hornet. He blows the [illegible] till it gives out a good smoke and then holds it under the

[illegible]

[illegible]

[illegible]

[illegible] they participate in the [illegible] but also to eat meat the meat of [illegible] animals killed, even the skin of elephant, rhinoceros, and hippopotamus is never rejected. As forbidden, i.e., taboo animals, the Wandorobbo regard elephant, rhinoceros, hippopotamus, pigs, rabbits, all clever-headed animals like the giraffe or the tiny dwarf antelope, baboons, wart-nibbles, and, of the birds, the ostrich, eagle, buzzards. Only these only an occasion of no business, which the Masai like to beg for the preparations of the ear beat ornaments. They do not hunt monkeys and lower animals, because they do not attack their meat.

On the day before the new moon, and on places also on the seventeenth day, the [illegible] no one goes hunting because, according to popular belief, one would be hit anything on the former day, whereas on the latter the lion would touch. The cut-headed [illegible] antelope is regarded as unlucky for the hunter. If the hunter sees it along the way he returns to camp immediately and does not leave it again until several hours later, in order to try his luck anew.

Like the warriors of the Masai, the [illegible] of the Wandorobbo also hold their meat meals in the forest. Whereas among the former, however, there are a result of the last rites, according to which the warrior only eat meat in the forest, among the latter it is only a matter of observing an ancient custom for which there is no longer any reason today, since the connected now usually eat to meat feast in the hut. On the other hand, there is greater restriction in relation to the [illegible] whom they recognize themselves by a plentiful eating of meat for a longer hunting expedition for more flavour and at the same time dangerous game, such as elephants and buffalo. The [illegible] arrows and stimulants that on because accustomed with among the Masai are also used by the Wandorobbo, but to a far lesser extent. They do not divide up into fellowships for the meals in the hut, but only for the hunting expeditions. Each company, as a rule, consists of four men and is called a [illegible], to which one recognizes the possession [illegible]. The booty is divided among the participants in [illegible] parts. If an individual hunter or as a circle spends the night in a strange camp, the host is given a [illegible] and a hind leg of the hunting booty.

PHYSICAL ENVIRONMENT

The North Tindiret Forest lies about five miles from the south-eastern boundary of the Nandi Land Unit, and rises from 7,000 ft. to over 9,000 ft. It consists of two great east-west ridges reaching an altitude of about 8,500 ft. divided by the deeply sunk river Kipkurere, "hollow (river)," the ridges merging some 12 miles from the western edge in the high ground round Timboroa which rises to over 9,000 ft. The region is dense evergreen "high forest," with trees of 100 ft. and over, and thick, impenetrable undergrowth growing to a height of 6 or 8 ft. The average rainfall on a farm two miles from the edge of the forest was 54.00 ins. over a period of nine years. Till within the last 25 years the Dorobo lived in small isolated settlements right inside the forest. Access was given by two parallel tracks across the south-western corner of the forest, and concealed paths branched off from them leading to the settlements. In addition to providing a permanent home, the forest was their wet-weather hunting ground; in dry weather the Dorobo used to hunt far afield over Nandi and the Uasin Gishu Plateau, and down to the Rift Valley. In 1937 they were removed from the forest, and a number of them (of domicile categories A and B) settled round the edge of the forest, along a narrow strip of grassland and bush that forms the upper edge of the farms which occupy the five-mile space between the forest and the Nandi Land Unit. But the intention of the Government had been to transfer the Dorobo to the Nandi Land Unit. This the Dorobo did not agree to, but their re-settlement along the edge of the forest was not officially accepted, and they lived there without legal rights unless they became squatters or casual labourers on the farms they settled on.

MAIN FEATURES OF ECONOMY

Till disturbed by European settlement, the Dorobo had a purely hunting economy, though during the last 30 years they have been taking some interest in the acquisition of cattle and in small-scale cultivation. In their hunting days, their only livestock were bees and dogs.

HUNTING

The year was divided into two seasons, *maaiowak*, the dry weather, when they hunted game of all sorts with bow and arrow both in the forest and much farther afield; and *sweiet*, the wet weather, when they set traps in the forest. In the past they hunted buffalo and elephant, and lion were killed in the plains; leopard and pig are still hunted. Smaller game hunted and eaten include antelope and monkeys of all kinds: almost any kind of meat was eaten, except that of hyena, jackal, and

[TEXT CONTINUES ON P.58--analyst]

1:Huntingford E-4, 5 (1938-1939) 1953 FL6 Dorobo FL6

other scavengers. Nowadays, all hunting activities are carried on illegally with the risk of being punished if caught by the police.

Weapons are the bow and poisoned arrows carried in a quiver. Knives are used to skin game and to make springes. Spears have never been used. The Dorobo used to have hunting dogs, but in the North Tinderet Forest the breed seems to have died out, though it existed in 1927. They have two kinds of trap: (i) The pit trap, *ngwet*, formerly used for buffalo, consisting of a pit 8 ft. long, 3 ft. wide, and 6 ft. deep, with wooden spikes set in the bottom. (ii) The springe or snare, *ferwet*, which consists, briefly, of a springy stick bent over, with a noose attached to it connected with a platform: the arrangement is such that when an animal treads on the platform its head enters the noose, and the pressure on the platform releases the springy stick, which flies up, tightening the noose, and holding the animal suspended. Such traps can be made in less than ten minutes. This type is used chiefly to catch antelopes, but leopards have been caught in them. Cross-bar traps with a drop-spear were not used by the Kipkurerek Dorobo.

The only hunting taboo recorded is that the night before he goes out hunting a man must abstain from sexual intercourse. This does not apply to the setting of traps.

As regards land rights, the forest was divided into districts, *kwost*, pl. *kwosuak*, and in his district each man had an hereditary block of land in which he hunted, set traps, kept his honey-barrels, and collected wild food. Occupation rights were recognised by public opinion, and trespass on a man's forest area, i.e., deliberate entry in order to start hunting without permission or the promise of a piece of meat, might result in the trespasser's death at the hands of the owner, who would then have to pay compensation for homicide. Theft of game from a trap is said never to have occurred, not only because the thief might be killed, but because his belly would swell to a great size and he would die after eating meat stolen from a trap.

Bees

Honey is to the Dorobo what milk is to the Nandi: it is "sacred," and its supply must be protected by the observance of taboos. Fruit and blood must not be eaten on the same day as honey (though meat may be eaten); when a comb is emptied, it must be carefully hidden in the undergrowth; and after eating honey a Dorobo cleans his hands in earth, not (like the Nandi) by wiping them with leaves.

The Dorobo recognise four varieties of bee: *sekemik*, the honey-producing kind; *imuik*, solitary bees which live in trees; *koromuk*, earth bees, which live in the ground; and *kiptaloswik*, mason bees, which live in cells made of earth and particles of stone cemented together by their own saliva. The Dorobo divide the honey-bees, *sekemik*, into three kinds: the queen, *kowet ap sekemik*, "the mother of the bees"; the workers, called simply *sekemik*, considered to be males, which make honey by eating the "sap" (*pek*) of flowers and then vomiting it into the empty honey-combs; and the drones, *kapsweik*, considered to be idle females which do nothing useful.

Hives or honey-barrels (*pesuset*) are made either of slats of wood tied together, with circular wooden end-pieces; or of the two halves of a piece of log split longitudinally and tied together. They are set in trees, and when a new hive is put up, the owner calls the bees, in a high-pitched tone, to come and occupy it: "Bees, bees, from all the country, come here now, and pour in honey, pour in honey." Bees are said to recognise their owners by their body-smell, and do not sting them when taking honey. Certainly taking honey does not appear to be a painful or dangerous process to the Dorobo owner. Theft of honey from a barrel is considered very low, and a man might kill a thief, though he would have to pay compensation for homicide.

Honey is an important article in Dorobo economy: it is eaten as food, made into an intoxicant, used for ritual purification, and it forms an article of commerce.

1:Huntingford E-4, 5 (1938-1939) 1953 FLÁ Dorobo FLÁ

585 [237] [591] that cow-dung be used for both the *tumdo* and *koronet*, and if there are no cattle in the bridegroom's settlement it must be procured from somewhere else. Marriage is patrilocal.

Marriage with Nandi

582 C48 Eighteen marriages were recorded in genealogies between Dorobo and Nandi or members of the Nandi group:

Dorobo and Nandi women: 6	Dorobo and Nandi men: 10
Dorobo and Keyo women: 1	Dorobo and Keyo men: 1
Dorobo and Terik women: 1	

Marriage of Dorobo women to outsiders seems to be due to the poverty of the Dorobo, which in these cases would have meant that the women would have remained unmarried; such marriages also mean the accession of stock to the Dorobo.

Polygyny

595 [587] Although there is no objection to polygyny, Dorobo seldom have the means of acquiring more than one wife at a time, though several cases occurred of re-marriage after a wife's death or desertion. In one genealogy a woman had no less than four successive husbands, none of them her husband's brother, and her only issue was one daughter.

Re-marriage of Widows

587 Unlike the Nandi, the Dorobo recognise the re-marriage of widows in the normal manner on payment of bridewealth to their fathers, brothers, or other representatives; it is, however, unusual. Widows normally live with their husband's brothers, return to their parents, or else live alone.

Divorce

586 Divorce is rare, and is of one kind only—permanent. The husband can claim the return of the bridewealth. But a wife who has borne a child cannot be divorced for any cause whatsoever.

Birth

843 [834] 844 846 862 845 [724] Intercourse between husband and wife stops at the fourth or fifth month of pregnancy, and is not resumed till the child is about six months old. Birth takes place in the husband's hut, the husband going to live elsewhere nearby. The wife is attended by a *midwife*, *ngaiteyonit*, and her mother is present if possible. She stays in the hut for six or seven days after the birth, and the child's body must be kept covered for several weeks, even the father being allowed to see only its face. The mother must be purified by her husband, who kills a goat (which he must acquire somehow if he has none of his own) and rubs the fat and undigested grass (*siyat*) from the stomach on her face, breasts, and belly. Children are weaned at the age of about a year. Twins are not liked, and the mother's ritual uncleanness caused by their birth must be removed by the killing of a goat which is eaten by the mother and her women friends. The Dorobo say that if a man has set a trap at the time when his wife bears twins, the trap will never again catch an animal.

553 [796] [882] Children receive their first name, the spirit-name, soon after birth; as among the Nandi, this name is not used, but links the child with a protecting spirit. The second or principal name is given before the child can walk, at the time when it is first given solid food, and is called "porridge name" in imitation of the Nandi custom. Children may also be given nicknames which often refer to some physical peculiarity. After circumcision, boys become *Arap*, son of, eldest sons taking their

2: Maguire G-5 (ca. 1926) 1927-28
FL6 Dorobo FL6.

possibly these Dorobo had been poor Masai, who, having lost their cattle, had taken to hunting, is probably the correct one. It would appear likely that the Dorobo in question were *Balaŋga*, though Sir Claud was unable to satisfy himself as to their true origin.

The original *Balaŋga* are stated to have come from the Kisongo [1] district of the Masai. It may be that this is the case, as the name Kisongo originally stood for a very large tract of country—in fact, almost the whole area occupied to-day by the Masai of Tanganyika Territory. It is certain that there now are *Balaŋga* Dorobo with the Masai throughout the length and breadth of the Tanganyika Masai Reserve, and it becomes more difficult daily to find *Balaŋga* who still devote themselves to hunting. Even those who own little or no stock prefer to live with their richer brethren or with the Masai. The younger men have never led a bush life. They carry spears [2] (and, when appropriate, shields) and do not care to be reminded of the fact that they were ever other than the Masai.

Occasionally, when an elephant or other large beast is killed by the European sportsman, a few old men (Masai, to all outward seeming) will make their appearance unobtrusively, generally accompanied by donkeys. Having obtained permission, they will proceed to rip and hack away huge quantities of the flesh with a determination and cheerful abandon seldom to be met with in the Masai. When the donkeys have been loaded with as much meat as they can carry, the old gentlemen will quietly depart, bound, presumably, for a banquet of Gargantuan proportions. Should one ask, they will admit shyly that they are *Balaŋga*, but will almost always add: "We are now Masai again."

I think there can be no doubt that the Masai and the *Balaŋga* are one and the same. The opinions of the Masai (notoriously unwilling to admit the equality of others) and the *Balaŋga* themselves are unanimous on the matter, and I have been unable to discover any shred of evidence to the contrary. It would appear reasonable to assume that the *Balaŋga* are the

[1] Cf. Hollis: *Masai Language and Folklore*: pp. 260, 261. The name would seem to be restricted, nowadays, to an area south-west and west of Arusha. (Map reference: B 5; Kilimanjaro: E, F, I, K.)

[2] The spear would not seem to be an indigenous Dorobo weapon.

2: Maguire G-5 (ca. 1926) 1927-28
FL6 Dorobo FL6

duration of which is in inverse ratio to its toothsomeness and the severity of the cook's hunger.

The Masai are good to the *Mósiro* and seldom refuse them a share in whatever food is obtainable—be it milk, meat or grain. The *Mósiro* expect this; in fact, many of them seem to look on free rations from the Masai as their right. The reason for this is stated to be that the *Mósiro* helped the Masai on many occasions in the past (particularly during the great rinderpest epidemic in the early 'nineties) by hunting for them when starvation had overcome the ingrained antipathy of the Masai to venison. In addition, before the coming of European rule many elephants were killed by the *Mósiro* at the request of the Masai. Lekite told me of one drive in which he and about thirty *Mósiro* were engaged during which sixteen elephants were killed.

When a *Mósiroi* obtained cattle he used, unless restrained by his more prudent friends, to slaughter and eat them in the shortest possible time. Up to quite recently, a beast was valued by the *Mósiroi* only for the amount of meat it was capable of providing, but nowadays a few of them are beginning to herd cattle in a small way and some even live as Masai. It is interesting to note that many of the older generation, particularly the women, profess an aversion to having cattle in the vicinity of their own dwelling- or sleeping-places.

A few *Mósiro* till the land, but in a half-hearted way. They are extremely improvident and prefer to risk almost inevitable famine rather than to exert themselves in cultivating grain. They never expect their women to work in such small plantations as they may have. A *Mósiroi* will cheerfully tramp the bush for a week or more, picking up a most precarious existence on tubers and roots, and will consider himself well repaid if he returns with a few pounds of honey. He will be horrified at the idea of putting in one hour's work each day on a mealie patch for the same length of time.

In the bush, very little in the way of food comes amiss to the *Mósiroi*. Failing meat, his favourite food is honey, but this is regarded as a delicacy and would be eaten wholesale only under the most exceptional circumstances. If meat and honey are unobtainable, the *Mósiroi* has at his command an extensive

2: Maguire G-5 (ca. 1926) 1927-28
FL6 Dorobo FL6

knowledge of roots, leaves, berries and tubers of all kinds, on many of which he is capable of supporting life.

Various kinds of honey are obtained in large quantities and they command a ready sale among the Masai, who are, for the most part, too indolent to look for honey themselves. The *Mósiro* are greatly assisted by the honey-bird [1] in their search and do not appear to suffer much inconvenience when stung. The honey is generally removed by hand, the despoiler working placidly in a cloud of angry, stinging bees. Occasionally a tree has to be felled, and in some cases the honey may be so inaccessible that fire has to be resorted to for the purpose of driving the bees away. Thick clouds of smoke are readily produced by the use of the *Endulee* [2] which every *Mósiroi* carries in his quiver.

With regard to the dress of the men, the *Mósiro* are seldom to be found wearing skins. I have seen *Mósiro* wearing a single garment of rough bark-cloth, knotted at the shoulder in the manner of the Masai blanket, but as a general rule their dress consists of a ragged strip of "Amerikani" or blanket, weather-worn in the extreme, tied over one shoulder and confined at the waist by the sword-belt. They say that they no longer wear skins because the latter make too much noise in the bush and lessen their chances of approaching close to game. The women wear a skin garment [3] of the same kind as that worn by the Masai women. They also wear anklets and armlets of wire, but the heavy iron necklaces and *'surutya* earrings of the Masai women are seldom, if ever, seen. It may

[1] *Cuculus Indicator*: a small drab bird about the size of the thrush. It has a short, but very sharp, bill, a white underside and black-striped wings. Its distinctive twittering is often heard in the bush, particularly in the vicinity of bush paths and other places it knows are likely to be frequented by humans. It flies from tree to tree, keeping up its twittering all the time, and is obviously anxious to be followed. I have followed this bird several times, and although honey was not always found at the end of the trail, it invariably led us to places where bees were or had been some time before. The *Mósiro* always answer the cries of this bird, even when they have no opportunity of following it. There are many legends about the honey-bird, which, I think, is to be met with throughout East Africa. The Swahili call this bird *Sego*; the Masai call it *En-jokóroi*; the *Mósiro* name it *Chekeandes*; the Nandi, *Chepkechs*.

[2] See the section devoted to Dorobo arms and equipment.

[3] *Ol-okessedi* (Masai).

2: Maguire G-5 (ca. 1926) 1927-28
FL6 Dorobo FL6

enormously developed maxillary muscles. Individual physical peculiarities are not readily apparent when pigtails are almost universally grown and bodies are smeared with red ochre. The Nilotic peculiarity of standing on one leg has been observed in the *Mósiro*, but it is not seen so often as in the case of the Masai. I have been unable to discover any examples of pronounced steatopygia in the women, who are, usually, more prolific than the Masai women, and who are prized by the Masai for this reason. The *Mósiro* are a hardy race, and even at a comparatively advanced age the men retain great powers of activity and endurance.

The older generation (in common with the Masai elders) pays little attention to its personal appearance. *Mósiro* of a certain age would seem to be less under Masai influence than are the young men and are readily distinguishable from the Masai at first sight. (It might, perhaps, be as well to modify this by saying that an eye unaccustomed to looking on Masai will often fail to detect any difference between them and Dorobo of any type. Recently, I made the experiment of asking two Europeans from the coast to separate the Masai from the Dorobo in a mixed gathering. Each of them made a different selection and each of them was wrong in the majority of cases.)

In hunting, tracking, bush-lore and forest-craft the *Mósiroi* is, in my opinion, without equal when in familiar country. He seems to know instinctively what an animal will do under given circumstances, and inability to follow its track will seldom result in the pursuit being abandoned. If the ground is stony or if the passage of other animals has obliterated the trail, the *Mósiroi* will go quietly forward and will eventually, by a combination of luck, instinct and knowledge of the country and the habits of the quarry, pick up the spoor again. I have seen this happen many times. The *Mósiroi* knows when extreme caution must be observed and when noise does not matter; he is never at a loss for a vantage-point and, on the whole, is tenacious and plucky in the pursuit of dangerous game. He can summon lion to a kill by producing a weird, muffled, nasal cry (it is supposed to represent the bleating of a goat, though it has little resemblance to that noise, to my

2: Maguire G-5 (ca. 1926) 1927-28
FL6 Dorobo FL6

mind) made by placing the forefingers on either side of the nose and calling into the hollow formed by the palms of the joined hands.[1]

The *Mósiro* are fast and accurate bowmen at close range, and there are few of them who have not accounted for more than one lion with this weapon. A *Mósiroi* at present in my employ is credited with having killed thirteen lions thus, three of them with one arrow. The arrows, of course, are poisoned,[2] and are discharged with a force that would, I feel sure, excite the admiration of a European toxophilite. A curious, crouching attitude is adopted when drawing the bow-string and the archer faces his target, not adopting the more usual position of standing at a right angle to it. The killing of a lion with the bow is not regarded as an event of especial importance and the carcass is often left to rot in its skin.

If trouble is in the wind, the *Mósiroi* will always make for the haven he knows best—the bush. There he will live, apparently quite independent of the products of civilisation, and in nowise inconvenienced by a total lack of water, for weeks at a stretch, returning (when the trouble has blown over) with a skin bottle or bag bulging with honey. I could not understand the apparent ability of the *Mósiro* to live for long periods in country I knew to be waterless until I had been introduced to what they laughingly said was "the dry-season water." This is an enormous tuber[3] with a skin like the domestic potato. Under the skin is a milky, sticky layer about half-an-inch in thickness. This surrounds the inner core, which is of the appearance and consistency of a raw potato, is slightly fibrous and very moist. When this is chewed (the residue is not generally, but may be, swallowed), it gives great relief to thirst. Squeezing or pounding one of these tubers over a cooking-pot will result in the accumulation of a surprising amount of quite

[1] My predecessor at Kibaya shot two male lions which were "called" to a kill in this way by the *Mósiro*. He sat beneath a tree at a place where two lions had recently killed; the *Mósiro* mounted the tree and began calling. After a short time, one lion came to the kill (a goat) and was shot. The second lion came quite soon afterwards and was duly given his quietus.

[2] See the section devoted to Dorobo arms.

[3] This tuber, called *Kicherembwos*, is also known to the Kitšto Masai and is called by them *Ol-kiserímbwa*. This is a corruption of the *Mósiro* name, and the Masai freely admit that they learned of its existence from the Dorobo.

FL6 Dorobo FL6

193 women and they ours. Now we live with our cattle like the Masai." This account is far from enlightening, and when Serkala states that the *Aramanik* live as Masai, I fancy he is making too sweeping an assertion. Admittedly, the *Aramanik* of Moipo live as Masai, and so do many *Aramanik* in the central areas of Tanganyika Masailand, but I suggest that the Dorobo living at the north end of Lake Eyasi and those on the Serenget' plain (north-west of the Ngorongoro localities), who live a purely bush life, are also *Aramanik*.[1] Lekite was positive in the assertion that all the Dorobo living as such in the northern areas of the Tanganyika Masai Reserve and, furthermore, all the Dorobo in the Kenya Masai Reserve,[2] are *Aramanik*. I have had no opportunity of testing the accuracy of this statement. However, I do not think it likely that there can be yet another type of Dorobo unknown to those individuals from whose information the present notes have been compiled. If my assumption be correct, I think it may well be that *Aramanik* and *Balanga* (the latter possibly under a different name) constitute the bulk of the Dorobo in Kenya, and that the Dorobo inhabitants of the northern areas of the Tanganyika Masai Reserve are almost all *Aramanik*.

The *Aramanik* at Moipo are not fishermen. They do not eat fish, but they are very partial to the meat and fat of the hippopotamus.[3] They do little hunting nowadays and are, both young men and elders, rapidly becoming indistinguishable from the Masai. The *Aramanik* living further north (notably those to the west of the Rift Wall at Sanjan, Salei and Peiáya) live a bush life of hunting and honey-gathering and are not above shooting a Masai ox when the chance presents itself.[4] They are extremely shy people and I have had little chance of establishing contact with them.

The most remarkable thing about the *Aramanik* is their language. It is guttural in the extreme, and while there would seem to be few of the characteristics of the Masai or *Mósiro*

[1] See p. 131, *loc. cit.* The Dorobo seen by Sir Claud Hollis may, alternatively, have been *Aramanik*.

[2] About 4000 in number.

[3] I have been unable to discover a single individual among the Masai and the Dorobo of all kinds who does not regard the eating of fish as anathema.

[4] According to unauthenticated statements made by certain Masai.

2: Maguire G5 (ca. 1926) 1927-28
FL6 Dorobo FL6

have lived in the country of the Kitĕto Masai, since they are stated to have been the precursors of the Masai in this part of the world.

I was unable to elicit any folk-tales from the *Aramanik*, who say that they know no stories or legends except those they have learned from the Masai. It is possible that further efforts in this direction might meet with better success. The *Aramanik* are not as friendly or as ready to discuss their own affairs as are the cheerful, happy-go-lucky *Mósiro*.

Many Masai superstitions and superstitious practices are to be found among the Dorobo. There are, however, certain customs and observances of a superstitious nature practised only by the Dorobo. Of the following three examples, the last two given are in his category.

The *Mósiro* will not kill a python. They say it is a hunter of meat, as are they themselves. Furthermore, if it be killed, the ground where it dies and where its blood is split is ever afterwards fatal to cattle grazing there.[1] No explanation is given of this, and it would seem worthy of note that the Dorobo are exceptionally quick and skilful killers of all other snakes.

When following a native path or a road, if a Dorobo comes to the place where the track of a snake crosses the path, he will never step over it without first kicking up the sand or earth in order to break the continuity of the snake's track. This is done in order to avert evil, and is stated to be the only efficacious way of ensuring that the snake in question will not eventually kill the man who has crossed its path.[2]

If a Dorobo has been robbed and if the thief cannot be found, the following procedure is sometimes resorted to. The man who has suffered the loss heats his sword in the fire until it is red and then, plunging it into the earth, he says: "The thief shall die to-morrow." This is regarded as a very bad practice and is seldom indulged in, as the injured party, no matter how much he may have lost, knows that he will become extremely unpopular as a result of his action.

It seems likely that in a few years' time there will be no *Balañga* and no *Kinyalañgat* Dorobo. As I have said elsewhere, it is now almost impossible to find *Balañga* or *Kinya-*

Hunting.

224 The chief occupation and, in fact, till the last few years, the only occupation of the Dorōbo, is hunting (*sagas*: Kony. *kip-sagas-ian* = hunter). They say that at the present day they do not hunt as much as they used to. All kinds of animals were the objects of the chase; the buffalo (*kiptarorōt*; N. *soiet*), rhinoceros (*kip-komit*), leopard (*melilto*, N.), lion (*sombit*; *ñgetuindo* N.,) giant pig (*tumda*, N.) were among the bigger game hunted. Various kinds of monkeys and antelopes are also sought after, both for their skins and their meat. (*See* "Food" for a list of the animals eaten by the Dorōbo.)

[411] The weapons used in the chase are the bow (*kuyañgda*, N.) and arrow (*kūtick*, N; *mbunatit*, etc.), and spears (*olmorondoit*†). Arrows and spears for hunting are
[278] poisoned with a concoction made from the keliot tree (N.).[1] Formerly, before the elephant disappeared from the Tindiret region it was hunted and killed with poisoned spears. Small game, besides being shot, are also caught in traps and snares, of which the Dorōbo have two kinds; buffalo are also caught in the first kind: (1) Pits (*nguret*), covered with thin sticks and leaves, with spikes (*kipcaiyeinat*) set in the bottom. (2) Snares (*porōset*; N. *mestet*) (Text-fig. 25), which are constructed as follows: a springy stick, A, is stuck in the ground and bent over; to its upper end is fastened a piece of tree-rope, B, which is loosely attached to a hooped stick stuck in the ground, supported by three short upright sticks; a little lower down the bent stick A is fastened a noose made from the ndorokyat tree, which is held in place by a cleft stick stuck in the ground on each side; under the noose is made a little platform of sticks, which is covered with leaves. When this platform is touched, since it is in contact with the stick holding the rope B, it releases the rope, and the stick A flies up, thereby tightening the noose.

[231] Dogs (*ñgôkto*, pl. *ñgôkik*) are used in hunting, and are the only animals kept by the Dorōbo who live in the forest. When in the forest they wear leather collars, to which are attached, under the throat, a small bell. The dogs seem to be of a different breed to the ordinary thin-nosed cur so common in native reserves, and they are kept in better condition. Their excrement round the huts takes the place of cow-dung in the neighbourhood of a Nandi hut, and makes the air unpleasant.

A description of the weapons is given on p. 346 below.

Food.

262 The staple foods of the Dorōbo are honey (*kumiat*, N.) and meat (*panyek*, N.).
136 For meat they kill the following animals:—

Antelopes.

Kipkeseket (N. *kimerenget*,).—Blue duiker (*Cephalophus æquatorialis*).
Mindet (N.).—Red duiker (*C. igna-issaci*).

[1] *Acocanthera Schimperi.*

133 9000 feet, watered by one main river, the Kipkurere, with its tributaries, and other streams which rise in the forest and flow down into Nandi.

133 137 361 The country which the Dorobo claim as their own is part of the North Tindiret Forest Reserve. Most of it is dense forest with tall trees and thick undergrowth; and till recently most of the Dorobo lived right inside it. Their settlements were isolated, though often not very far removed spatially from one another; but they were separated by a solid wall of trees, of which a few hundred yards form a more effective barrier than a mile of open country. Even in the past, however, the Dorobo did not live exclusively inside the forest, and on the southern side overlooking the Meteitei valley in particular, where the Nandi were less frequent, they often lived in glades near the edge of the forest. Thus the chief settlement of the district called [103] Sosoiyo was situated between the forest proper and the belt of flat-topped acacia thorn trees which surrounds it. Those who preferred to live in the open, however, still kept close to the forest, and a strip of thorn and scrub kept them well enough concealed from the outside world. A man who lived thus, though still close to his trees, might escape some of the damp of the forest, and was just as well placed for hunting and trapping as those who lived inside. In the old days, when there were only Nandi about them, people could live in or out of the forest as they pleased, and could alternate between forest and glade according to season or preference. Nowadays they [648] are not allowed by the Government to live in the forest, and those who survive and still cling to their own land, living on the surrounding farms as labourers or by charity of the farmers, are all settled as close to the boundary of the forest reserve as they can get, and seldom are they more than 500 yards from it. This boundary is marked by a broad strip from which the bushes and grass are cut, and it acts both as a line of demarcation and as a firebreak.

● 224 In the old days, Dorobo used to range far from their permanent homes to hunt, coming down to the plains which in those days were swarming with game of all sorts. The Dorobo of the Eastern Mau, Mount Kenya, and Saleta used to descend to the floor of the Rift Valley to hunt, for the only inhabitants were scattered Masae whom it was easy to avoid; and the Kipkurerek wandered at will over the Uasin Gishu plateau, also thinly inhabited by Masae, and latterly, during the second half of the 19th century, by still less frequent Nandi herdsmen. Even thirty years ago the Plateau carried a good deal of game, and before the coming of the European it was a hunter's paradise.

648 To-day, the Kipkurerek Dorobo are the survivors of a once flourishing and autonomous horde which has lost both its land and the right to its own identity. It was decided by the Government, for several reasons, that the Dorobo should be removed from the forest and settled in Nandi. They were transferred in 1937; but the transaction was not a success, for both Dorobo and Nandi resented the movement, and in a short time the Dorobo were back round the forest, where they were living up to 1940 without any legal right unless as squatters or labourers.

4:Huntingford E-5 (1938-1939) 1951 FL6 Dorobo FL6

gaining his position through the tacit recognition of the people. The horde therefore consists of a loosely integrated group of districts held together partly because they "are all Dorobo", but much more by the clan-solidarity which extends across the district boundaries. The clan is thus a far more important institution than it is among the Nandi.

The Dorobo are a hunting people who have been forced to take up agriculture, and at the same time are in process of acquiring a small amount of live stock. A great deal of their culture and most of their language have been borrowed from the Nandi; but their habits and mental characteristics are their own, including a "hunting outlook" which contrasts with the "cattle outlook" of the pastoralist, and a feeling of sympathy with wild animals that does not exist among either pastoralists or agriculturalists. Next in importance to hunting come bees, and honey is regarded much as pastoral people regard milk.

Although the Dorobo are commonly thought of as a people who wander at will wherever there is game, this notion is true only to a limited extent. Parties used to go far afield in the old days seeking game outside their own territory in the sparsely inhabited areas of the highlands; but their own forest was and still is divided into strictly observed economic areas where are family holdings in which people hunt, set traps, keep their bees, and collect vegetable food. These areas may look small on the map; but anyone who thinks that half an inch on a map (representing perhaps one mile on the ground) seems a very short distance, will find when he gets to the forest that one mile on the ground is a very formidable tract offering all sorts of possibilities for the hunter, and infinite chances for the stranger to lose himself.

you are a spirit". A man who kills a snake at night in his hut need not necessarily become ill as a result (as the Nandi believe he will), but the ancestor whose spirit was in the snake will show his anger by never going to see the man again and transferring his attentions to some other member of the family. This would no doubt result in bad luck, for the offender would be continually conscious of what he had done. Another account, however, which I think more nearly represents the common belief, is that after offering a snake honey-and-water or milk, the owner of the hut says to it: *Ui si nyon tun ingoii lakwet*, "Go and return when (my wife) bears a child", so that the name of the spirit may be given to the child. According to this account, if a man should kill a snake at night in his hut, he will probably be ill the next day unless he pours some honey-wine on the floor where the snake had been in the night. This should free him from the danger of illness. Snakes seen in the daytime may be killed without fear.

The spirits also appear in daylight as shadows (*uruet*) and they may make their presence known by slight noises, like the sound of a stick being broken. When a man sees an unaccountable shadow, or hears a noise for which he can see no cause, he concludes that it was a spirit which has come to see him, or perhaps just come up to take a walk on earth. But he need do nothing, nor need he be afraid, for at such times the spirits do no harm.

Before setting out to hunt, a man asks the spirits to help him:

Cesowiliik, ohõnec tiony ne kipare,
Spirits, give-us animal which we-may-kill;
ohõnec kumik si kiipiiye.
Give-us honey enough-to-satisfy-us.

Offerings of honey-and-water, *lokomek*, are sometimes poured on the ground from gourds with a request to the spirits to provide food in times of scarcity. Such offerings are made by people at their own homes when their affairs are going badly:

Cesowiloi, opiiyec omõii,
Spirits, fill-us-with food,
si kiipiiye sapot.
That we-may-be-filled-with health.

When a man is very ill, he sometimes sees what he takes to be another man lying beside him for a short time, who is invisible to other people. When he has recovered, he realizes that this other man was a spirit who had come to help him to get well, and to take into himself the sickness: *Konyon si korîpe, korn ne korue clio ne mioni, si kosop*, "He came to guard him, and lay where the sick man lay, to make him well".

Evil spirits sometimes attack people when asleep and make them ill. They also play tricks on people and do spiteful and irritating things to them. A man is walking, for example, and suddenly catches his foot, as he thinks, in a liana drawn tight across the path, and falls. But he finds nothing there, and realizes that it was done by an evil spirit. In 1927 I was one night encamped on the edge of the forest between Kipkorom and Timopo, with

5:Huntingford E-5 (1938-1939) 1954 FL6 Dorobo FL6

the forces of nature, a belief which (I am convinced) does have the effect of giving him confidence in his ability to deal with an imperfectly understood world. All those parts of human life in which there is an element of uncertainty or danger can be "controlled" by means of magic, not always completely, but with enough coincidental result to confirm the belief that what has been done is the right thing to do and to keep on doing.

The main occupation of the Dorobo was hunting. Unfortunately this is one of the things we know least about, because owing to external pressure the Dorobo have had to give up real hunting and now confine themselves to trapping. It was therefore impossible to get hold of anything more than a few allusions to the hunting magic of the old days. On the one hand, fear of the government has undoubtedly sealed the lips of some of the older Dorobo, for hunting is now forbidden, and they were afraid, quite mistakenly, that if they talked about it, they might get into trouble, as people might think they were still hunting; and on the other hand, ignorance prevents the younger men from talking about it, for most of them have never hunted in the real sense of the word. But there was hunting magic. There was, for example, not only a seasonal division of hunting activities, but a magical division as well. In the dry weather people used to hunt far afield with bow and arrow; in the wet weather they set traps close to home. Now from the magical point of view it is the bow and arrow work that needs help, for in it there is an element of danger to the hunter, and of uncertainty as to whether he will make a kill. In trapping, the process is mechanical, a mere matter of being able to make a trap. All that need be done is to set the trap and wait: sooner or later it will catch something without any danger to the trapper. So when a man was going out with bow and arrow he had to abstain from sexual intercourse immediately before setting out on an expedition, lest the act should put him into mystical danger. Prayers and the observation of omens before going out gave a man further confidence. But when setting traps this abstinence is not necessary.

We have already come across a good deal of magic. The forms of purification after killing people, for instance, are magical as much as religious; so is the cleansing of women after childbirth; and all sorts of things people do in daily life are nothing else but manifestations of the belief in the efficacy of magic. When a man puts a new honey-barrel into a tree and calls out to the bees to enter it, his call is as much a magical utterance as a mere invitation to enter his barrel.

Omens include the following:

If the birds called *kiptiltil* and *kiphuuhuu* or *kiphoukou* (both species of woodpecker) are seen or heard on the right hand side when starting out to hunt or on a journey, a man will be successful; but if they are on the left, he will be unsuccessful.

If a snake crosses the path from right to left, having first been seen lying still on the side of the path, it is a bad sign, and a man should return home and wait till the next day. But a snake which is seen in the act of crossing a path is of no significance, "for it also is travelling".

5:Huntingford E-5 (1938-1939) 1954 FLÓ Dorobo FLÓ

Maintenance of ritual relations with the spirits is effected by the recognized offerings made to them; and with 'nature', on which the food supply depends, by other means (see below).

The World Order. In the myths related at the beginning of § 5, the thunder plays an important part, and is even portrayed as a man. One might almost assume from this that he was believed to be an earth-dweller who began a second life in the sky as the thunder-god who controls the rain, for the notions of rain, mist, and thunder are all interwoven, and the rainbow is "the arm of *Ilet* that draws water for him". These myths reflect the Dorobo attitude of the people to their surroundings. One of the chief features of the forest is heavy rain and frequent mist, and it would be surprising if we did not find among them the conception of some sort of rain-being who brought mist. Again, since rain is plentiful and droughts rare, the rainmaker is not needed, and although the lowest known rainfall, 28 inches in 1933 at a place two miles from the edge of the forest (and probably a little higher in the forest), would indeed constitute a drought year elsewhere, in the absence of both crops and cattle an occasional low rainfall does not matter so long as there is enough to make the plants flower. Even a heavy rainfall of 70 inches or over does no more than cause temporary inconvenience where there are no crops to be damaged and the slopes prevent flooding. The Tindiret forest is, in fact, an ideal place for hunters to live in. However prolonged the dry season, the conditions for wild life are better there than in the open plains below, and low rainfall has never yet prevented a supply of game to hunt or trap. Whether the people are able to kill enough game to ensure a supply of food is another matter, and the inter-relation is not so much that between man and nature in general, but between man and the animals. Man's wrong-doing is thought to produce either a failure of the supply of animals, or his inability to kill or catch what is there in abundance.

Social Values. Things which are important to man because they are indispensable to him have what is called a social value as well as a ritual value, because between man and them there is created a relationship which man must maintain if he is not to suffer. The food supply of a hunting people is got from day to day and depends on the skill of the hunter. It is uncertain, because on any given day the hunter may not find game, or having found it may not kill. But precarious as such a life might seem, there is no evidence that in the past there was often any great scarcity from either of these two causes. The old men say, in fact, that whereas food is scarce under present-day conditions, in the old days when hunting was not restricted it was, if not always abundant, at least enough. Such a statement is not, I think, merely an exaggerated memory of better days, the outcome of a longing to get back to the forest, but it explains in part the otherwise remarkable scarcity of hunting magic and ritual procedure. Some hunting magic there certainly was, and fear and ignorance prevent free talk about it; but it is clear that when the food supply throughout the centuries is found adequate,

5:Huntingford E-5 (1938-1939) 1954 FLÁ Dorobo FLÁ

an elaborate ritual will not be built up to increase or protect it. What is expected, and what one does indeed find, is that the hunters will take what steps they can to keep on the right side of these beings which can hinder them or destroy their technical skill.

Wild animals which supply both food and the raw material for technical and domestic processes have social value, and by 1930 cattle and goats were beginning to acquire it, though they were so recently introduced as Dorobo possessions that very little in the way of ritual practices concerning them had developed. Wild animals of almost every kind are of some use to the Dorobo, and while it cannot be asserted that there is actual ritual expression towards many of them, there is nevertheless a not very clearly defined or indeed definable feeling of nearness, almost of kinship with them. This was revealed by listening to conversations between Dorobo as they went through the forest, and demonstrated the intensity of their interest in the animal life of the place, as well as their immediate appreciation of almost invisible signs which the Nandi (and of course myself) passed without even noticing. Although the animals of the forest are wild, and the property of no man, in the sense that cattle are property, the Dorobo feel a proprietary interest in them, especially when they are in a man's own section of the forest. It is clear that they have a feeling for the animals which may be described as "fondness", the nearest (though not very adequate) English rendering of the untranslateable word *consist*; and that they regard them as intelligent beings, not on the human level, but none the less worthy of respect and friendliness. They are spoken of without loathing, disgust or contempt; and whereas the reaction of the average Nandi to the sight of a buck or its spoor is merely a gleam of greed and lust for meat, the reaction of the Dorobo is much more than that. He no doubt thinks it would be nice to eat, but at the same time he wants to know all about it, where it came from, where it was going, and so forth, and even if he has no intention of hunting it, he will examine the ground to find out all he can, for although only an animal it is one of the living things which share the forest with him. One Dorobo did in fact try to describe his attitude to wild life in the following words:

Sue kulok cepo tukul. Cemo Okiek ni koswen
They-know the-fact which-are-of all. They-like the-Dorobo that they-may-see
tiosik. Ma yaaren tiosik, emo kimenye tukul kuskenge samakin.
the-animals. Not bad the-animals, for we-dwell-in all together the-forest.
Ngomost ap tiosik ma ne nepo pii, ako ma lot, emo nomon
Intelligence of the-animals not like that-which-is-of men, but not far, for intelligent
ok icek tiosik. Kuske tukul tiond ap samak. Kiomo alak, makiomo
also they the-animals. Alike every animal of forest. We-eat some, we-eat-not
alak; ako kiomo tukul. Ki po samak, ok icek ce po samak.
others; but we-like all. We-are of forest, and they which(are) of forest.

(The Dorobo know the spoor of all the animals, and they like also to see the animals. The animals are not bad, for we all dwell in the forest together. The intelligence of the animals is not like that of people, but it is not very

6:Huntingford E-5 (1938-1939) 1953 FLA Dorobo FLA

The Dorobo divide the year into two parts, *Musiowik*, the dry season, when they used to go hunting the bigger game with bow and arrow; and *Iwot*, the wet season, when they set traps. Each season covers roughly half the year, the rain beginning to tail off in September and getting less and less till January, and then starting to work up again in March, reaching its peak about May; so that *Musiowik* comprises our months of October to March, and *Iwot*, April to September. The Dorobo have twelve months, all but two having the same names as the Nandi months, but they do not synchronize*:

Dorobo names:	Nandi names:		
Kipsirmo	*Kipsondet*	October	
Kipsondet	*Kipsondet aiew*	November	
Kipsondet ake	*Mulkol*	December	Musiowik
Mulkol	*Ngetiatet* *	January	
Ngetiatet *	*Kiptamo*	February	
Kiptamo	*Iwot kut*	March	
Iwot kut	*Wakut*	April	
Wakut	*Ngei* *	May	
Mamut	*Rop tui*	June	Iwot
Rop tui	*Purut*	July	
Puruto	*Kpese*	August	
Yeperut	*Mulkol aiew*	September	

The average rainfall at Kapchorua Farm, about two miles below the edge of the forest for the years 1920 to 1937 was 54.09 inches, the maximum being 69.17, the minimum 39.01. Details are given in the Appendix. In the forest itself I think the rainfall is undoubtedly a little higher, perhaps amounting to another 3-3 ins. in the course of an average year.

The Dorobo seem to have a better weather sense than the Nandi, and I found that they were generally accurate when making a forecast, whereas the Nandi are usually wrong when they try to foretell the weather. This weather sense is perhaps one of the reasons for their reputation among other tribes as rainmakers; for these Dorobo not only say that they have no rainmakers, but I could find no trace whatever of rainmaking activities, nor any hint that they ever had any. Climatic conditions are such, however, that in a hunting economy rainmaking is not a necessity.

The environment of the Dorobo provides them with food, skins, wood, and other vegetable materials. Iron they had not, and they still have no knowledge of ironworking, though they use iron implements. Their activities comprised hunting, trapping, food-gathering, hut-building, the production of honey, and the making of objects of wood, leather, and grass, such as traps, arrow-shafts, bows, honey-barrels, clothing, rope, baskets, and handles for tools. Objects of iron they have got for as far back as they can remember from the Nandi by exchange for such things as they can make or produce themselves.

* Throughout this paper I have written the value usual by the sign a, representing the "long-tailed a". In words marked * the first consonant is the value usual.

6:Huntingford E-5 (1938-1939) 1953 FLA Dorobo FLA

The economic unit is the family, of whatever kind, elementary or domestic, living alone or within a group. The unit formed of a man, his wife, and their children can actually provide itself, under normal conditions, with most of its necessary subsistence, with a certain amount of help from those to whom they are entitled to turn for it. The first necessity is of course food. This is of two kinds, meat and vegetable, and the animal sort is now both wild and cultivated, though formerly the Dorobo ate but little in the way of cereals; restrictions on hunting have now forced them to do so. In the old days meat and honey were the principal foods, vegetables being eaten as a relish. The foods now eaten may be classed under the following heads in order of traditional importance:

1. Meat: got by hunting and trapping.
2. Honey: from their honey-barrels.
3. Wild plants: collected.
4. Salt: made or bought.
5. Drink: made from honey.
6. Cereals: eleusine and maize, grown; maize, bought.
7. Milk: for those who have cows.

Almost any kind of meat, except that of scavengers like jackal, hyaena, mongoose, etc., was and still is eaten, including antelopes, monkeys, and bigger game. Of antelopes they eat the following:

*Ngumwayat**, the common duiker (*cephalophus Grimmi*).
Kipurkwat, the blue duiker (*C. sequatorialis*).
Mwakat, the red duiker (*C. ignu-rauci*).
Kwomasit, the bushbuck (*Tragelaphus scriptus*).
Irukwint, the reedbuck (*Cervicapra arundinum*).
Kwepsit, the grisi (*Ourebia montana*).
Kipsumwet, the waterbuck (*Cobus ellipsiprymnus*).

Of monkeys they eat:

Saint, the colobus (*Colobus guereza*).
Tirsit, Sykes' monkey (*Cercopithecus albogularis*).
Cwest, grey monkey (*C. griseo-viridis*).
Kwenkwat, the baboon (*Papio cynocephalus*).

And of other animals they eat:

Twest, the wild pig or wart-hog (*Phacochoerus aethiopicus*).
Tumia, the giant pig (*Hylochoerus Meinertzhageni*).
Mdidis, the leopard.
Simbit, the lion.
Saint, the buffalo.
Pdiat, the elephant.

There are, however, no elephant in the Dorobo country to-day, nor have there been within living Dorobo memory; but buffalo still occur in the

6:Huntingford E-5 (1938-1939) 1953 FL6 Dorobo FL6

kupotok. Kiinde tajat kut kuruvio. Pani-e ebesiek ee cam ai kuruvio 273
as-well. It-is-put-in the-loft till it-ripens. It-remains the-days many that it-may-
kut koiek maiyak. Kile.
ripen till it-becomes the-drink. (Then) we-drink.

(Some seed-pods are boiled so that they can be split; they are washed in the river to remove any dirt sticking to them, and then when they have become quite soft, they are put in the sun to dry. The dried strips are next put into a pot containing honey and nothing else, to make it bitter, i. e. to ferment it, and some water is added. The mixture is put in the loft to ferment. It is left for several days till it is ready and can be drunk. Then we drink it.) Another drink called *kokomek*, or honey-and-water, is also a favourite of the 272
Dorobo; it is not intoxicating and is much simpler to prepare than honey-wine, being simply honey and water mixed together, without the addition of seed-pods, and drunk the same day without any fermentation.

In the old days, the Dorobo say, they were seldom absolutely without 262
food, for meat could generally be got with either bow or trap, and unless a 224 ●
man was ill or away, when someone would help his family with food, he could 177
usually get enough to feed them. This is probably true, for in those days game was plentiful enough, and there were no Europeans to restrict their hunting activities. Nowadays, when hunting is curtailed, and reduced to little more than trapping, there is an uncertainty about the food supply which even the introduction of agriculture and the nearness of European farms does not altogether remove. A man may be just unlucky with his trapping: European influence, as "harmful magic", is blamed for this; and his crop may be a 262
small one, or much damaged by vermin. And although one member of a [464]
family may even be a wage-earner on a neighbouring farm and get a daily [466]
ration of 2 lbs. of maize meal when he works, he has to feed not only himself [693]
but his own family and perhaps others. For instance, a man of my
acquaintance named Arap Keter had to feed his wife, his child, his sister, and his mother, as well as himself. Arap Ruto, one of his neighbours, who also worked on a farm, had at times to feed his brother Arap Misin, his wife, his four children, and his mother. Two pounds of meal a day do not go far to eke out a small crop and the produce of the traps and honey-barrels when divided among eight people in a bad season. Shortages are remedied as far 476
as possible by the principle of sharing, and a man who has food left over after feeding his own family must, and does, help to feed certain others if need be. Arap Ruto, as we have just seen, has had to feed seven people besides himself at times; but in the past the normal rule of food distribution 224
was that a man provided meat for his wife and children, for his parents, and 476
sometimes his wife's parents, since the old people, as always, depend on what [888]
their sons and sons-in-law can give them. A successful hunter also shared his kill with those who went with him and were unlucky. The distribution of meat was thus as follows:

Hunter
1. Own family.
2. Own parents.
3. Wife's parents.
4. Fellow hunters.

6:Huntingford E-5 (1938-1939) 1953 FLA Dorobo FLA

224 476 In a settlement or clearing inhabited by several people, meat would be shared in a definite way:

I	Or	II	Or	III
A a man		A a man		A a man
B his father		B his brother		B a clansman
C his brother		C a clansman		C a clansman

A supplies B first, then C if C has no food; but before anybody else is given meat, A must give some to his father or father-in-law if they are within reach. Vegetable food, being accessible to all, is not shared.

462 There is a clear division of essential work between the sexes. Everything connected with hunting, bees, and weapons is done by men; women do the domestic work and other things of that nature. The more important normal occupations are divided thus:

Men:	Women:
1. Making fire.	Building houses.
2. Hunting.	Collecting vegetable food.
3. Trapping.	Getting water and firewood.
4. Putting meat on to cook.	Looking after meat cooking.
5. Making honey-barrels.	Collecting other foods.
6. Collecting honey.	Milking (if cattle are owned).
7. Making weapons.	Making baskets.
8. Exchange with the Nandi.	Preparing skins.
9. Getting coloured earth.	Making clothes, etc.
10. Cutting wood for uses other than firewood and building.	Care of the children.
11. Making fences.	Sweeping huts, etc.
12. Preliminary heavy work in the shamba[*].	Cultivation — all stages.

[257] Children of both sexes help in weeding and herding livestock; girls help with the housework and milking cows; boys milk till they are circumcised.

In the list above, the sex-division is followed strictly with regard to the first nine items of men's work; in the last three there is a certain amount of overlapping. Of women's work, basket-making, the preparation of skins, and making clothes are strictly confined to women, but the essential household work of preparing and cooking food, sweeping, and cultivation is often done by men, especially when they live alone in the state of monosis; such men get baskets and suchlike from women in exchange for meat and food. House-building, including cutting and carrying the wood and roof-material, is all done by women, unless a man is living alone, or has to build a new hut at a time when his wife is for some reason away; Arap Misin, for instance, had to build a new hut when his wife was ill, and in consequence had to do

[238]

[*] Swahili for a piece of cultivated ground, and widely used by Europeans.

6:Huntingford E-5 (1938-1939) 1953 FL6 Dorobo FL6

435 1 bundle of tobacco (about 1 lb.) for 1 bagful of honey.
1 large earthenware pot for 1 large prepared antelope skin.
1 small earthenware pot for 1 small prepared antelope skin.
2 baskets of cereal seed for 1 basket (*kerepet*).
1/- worth of trade beads for 1 gourd full of honey.

[804] The bag used as a measure for honey is the smaller size of *kerepet*, measuring 7 or 8 ins. by 6 ½ or 7 ins. The gourd is about 10 ins. long. The large pot stands about 20 ins. high, the small, about 10 ins., and the large antelope skin is usually a bushbuck, the small one a duiker.

437 There are no special market places or places of exchange. The Dorobo
434 go to the nearest smith or potter and make a bargain, returning later with
[443] the exchange equivalent to collect the goods. There is no language difficulty
[197] in these transactions, for the Dorobo language is no more than an easily understood dialect of Nandi. Getting iron or pottery means going into the Reserve, but to get seeds, tobacco or beads they need only go to the nearest friendly Nandi who has what they want and is willing to make the exchange. Sometimes plant material of medicinal value (i. e. what they think is medicinal value) is substituted for some of the regular exchange articles, but the above list represents the ordinary practice. When Dorobo have money with which to buy what they want instead of exchanging goods, they have the choice of going to the shops at either Songhor in the south, or else at Aruos in the Nandi Reserve, where there is a collection of Indian shops. The men do not [562] like their womenfolk to go to these places unescorted, but occasionally some of the bolder ones try to slip away unobserved to Aruos; they seldom go to Songhor, as it is in the European area.

476 No human group can exist without some form of co-operation, and even when a man lives alone, as he may have to among the Dorobo, he is not because of that cut off from or unable to share in the activities of his horde. Within the family people are interdependent, and in the settlement they help each other. The main activities in which people normally co-operate are four in number: 1. House-building; 2. Hunting; 3. Digging earth; 4. Cultivation. [462] (1) Building huts is women's work, which a man will do if he has no wife, and for which he will get help from a relative or clansfellow. (2) When people [224] hunted game they usually went out in parties, and the kill was shared among them. [317] (3) Digging earth means a journey of anything up to 16 miles round the edge of the forest and into country where nowadays there are strangers, so people find it both safer and more convenient to go in parties, for though they are in no danger of being attacked, their unconquerable shyness demands numbers to give confidence. (4) In a family or clan group, though each individual has his own [241] shamba, he will expect both to help and to be helped by the other members.

Together with the spirit of co-operation is the rule of joint consumption. [276] We have already seen how meat is shared according to definite rules; and among the Dorobo certain other things which are hard to come by must also be shared. The chief of these is tobacco, of which when a man has acquired even a small supply, he is supposed to give some to his father, to his wife's

6:Huntingford E-5 (1938-1939) 1953 FL6 Dorobo FL6

barrel so that the smoke goes inside and the bees come out. He then takes out what honey he wants, wraps it in the leaves he has brought, and descends, carefully extinguishing the tinder when he has reached the ground. Though sometimes the barrels are not more than a few feet from the ground, very often the process of taking honey means a climb of eighty feet or so with no help but the unsteady ladder already described.

Although honey has great ritual and social value, like milk to the Nandi it cannot be said that bees take the place of cattle in the daily life of the people, for they require and receive no care beyond the provision of barrels and the due observance of the taboos concerning honey, and there is really no need to know very much about them. But as producers of honey, bees provide material for food, drink, and ritual, and they are thus of some importance. Honey, too, is a much-used medium of exchange. Without honey, Dorobo life would be vain and empty.

b) Hunting

In the past, hunting was the chief occupation of Dorobo men, and though they hunt but little now, confining their activities to trapping, they have still a "hunting outlook". The conversation of Dorobo walking through the forest sooner or later turns on the animal life around them, for as we have already noted, they have what the Nandi call *comiet*, which one might almost render 'affinity', with the beasts of the forest. The sort of talk that goes on in the forest is something like this sample, which I took down after hearing it :

A. *Keliek ap tiowik.*
The-feet of the-animals.

B. *Iro, ni poinet, punu yo, wendi yo.*
Look, this-one (is) the-bushbuck, it-comes-from over-there, it-goes over-there.
Miniw, a ma miniw misiw, tinye lakuennyi kitekin.
Small, but not small very, it-has its-child small.

A. *Cecoh cuto tiowik, mii samaklannyon; acome cepo samak.*
(They are) ours these animals, they-are-in our-forest; I-like (the things) which-are-of forest.

B. *Ingesuwen ulinto timin, apere mii tiond ake. Ne ni ne kuikuioti orti?*
Let-us-look over-there (in) that-forest, perhaps there-is the-animal another. What (is) this that creeps-about inside?

A. *Apere tumia.*
Perhaps the-giant-pig.

B. *Weiis, aswweni metit. Inguatinye kuyanda apere no. A mamii kuyanda.*
Yes, I-see the-head. If-I-had the-bow I-kill that-one. But there-is-not-here the-bow.

A. *Ingesuwen ole mwe.*
Let-us-see where it-escapes-(to).

6:Huntingford E-5 (1938-1939) 1953 FL6 Dorobo FL6

The year was divided, from the hunting point of view, into the dry season and the wet season. In the wet season people did not generally go out hunting, but stayed at home and set traps to catch antelopes and the like. In the dry season they hunted all sorts of game with bow and arrow in the forest and far afield. Thus, Arap Minin told of how soon after he had been circumcised he was one of a hunting party that went into North Nandi, as far as the hills Kaptepe and Tapsakoi [18] near the modern Turbo, some forty miles from the forest, in the days when there were no Europeans there; and another Dorobo spoke of hunting monkeys as far from home as Kapiyet in North Nandi. Leopard, monkey, and pig are still plentiful. Buffalo still exist to the east, in the direction of Timboroa and Londiani, but they have not been hunted by the Dorobo in recent years, in fact, they say, not since about 1900 when the Kaplelac age were warriors. Elephant are no more, but they were found in this area, according to some old men, when the Sawe and Kipkoimet were warriors about 60 to 70 years ago. There are no lion in the forest, but the Dorobo occasionally shot them in the plains. Leopard used to be hunted by organized parties, but this practice has been discontinued for some years, though they are still attacked and killed by individuals if they get aggressive, as in February 1939, when Arap Singira got his lip torn in a leopard hunt at Sosoiyo. Sometimes traps are made for them, of wire which is picked up on the farms. But trapping leopard is not common, and the trap made by Arap Menati which caught a leopard in July 1938 was said to be exceptional. Generally they prefer to hunt a leopard with dogs, as in the old days, when if one was put up by a dog and climbed a tree, the hunter came and shot it.

There is really no close season, as we understand the expression. The trapping season, which did in fact give the game a respite, was not intended for that purpose, but was for the convenience of the hunters themselves, because when it is wet, the forest is difficult to go through, the undergrowth thick, and the ground muddy and slippery; though some have been known to hunt pig there in wet weather.

Dorobo hunting equipment consisted of a bow, poisoned arrows, quiver, knife, and dogs. Spears have never been used by the Kipkurerek, and the spear trap reported to be found among some Dorobo does not appear ever to have been one of their methods of killing big game. For trapping, a man needs only something to cut the materials with, and, of course, his skill; if he is to make a pit-trap, he needs something to dig with.

Bows are made mainly from the *kuriot* tree (teclea sp.) and are about 5 ft. in length. A suitable piece of wood is cut and scraped with a knife-blade till it is smooth and of the right thickness. The bow-string, *inet*, is made of gut from the giant pig, *tumta;* the gut is stretched, greased and twisted till it becomes sufficiently strong and pliable for use. It is knotted to the ends of the bow an inch or so from each end: no notch is cut in the wood to receive it. Arrow-shafts are made from the *koromandet* and *masaita* trees, as well as from split bamboo; they are smoothed with a knife-blade in the same way as

[18] Better known to Europeans as Kiboloss and Kapsagoi.

6:Huntingford E-5 (1938-1939) 1953 FL6 Dorobo FL6

the bow. Quivers are made of ox-hide. Arrow-poison is made from the bush called *keliot* (acocanthera Schimperi), the use of which the Nandi say was discovered by the Dorobo [16]. It is made in this way: leaves and branches are broken off and boiled in a pot for several hours. The resulting liquid is strained and boiled again till it becomes thick and tar-like. When cool it is placed on a sheet of bark, covered with another piece of bark and put in a tree out of the reach of children, together with the pot in which it was boiled. After making poison a man must purify himself by bathing in a river. *Keliot* poison acts very quickly, but does not make the whole of the animal killed by it unfit to eat. The flesh round the site of entry is cut away and destroyed, and the rest is eaten with safety.

The Dorobo used to have hunting dogs (*sokto*, pl. *sokik*) which at one time were the only animals they kept. They still have dogs, but the hunting breed which I saw in the Kelpui-Kipkorom area in 1927, seems to have died out, for though I saw a few dogs there in 1939, they were nothing more than the ordinary native type, the thin-nosed cur so common in Native Reserves and on farms wherever Africans are found. The original breed, as I saw it in 1927, had, it is true, a tightly curled tail, but was a much better looking animal, of a different shape, and much fiercer, resembling the so-called '*basenji*' dog of the Belgian Congo [17] more than anything else, especially in its prick ears, tail, and carriage, though it could bark. When in the forest, the Dorobo put leather collars on their dogs, with a small bell under the throat so that they could tell where the animals were when they put up game. It was noticeable both in 1927 and 1939 that the Dorobo treated their dogs better than Africans usually do — they paid more attention to them, played with them, and fondled them.

The traps used by the Kipkurerek are of two kinds: the pit-trap, and the springe. The pit-trap, *nguret*, is simply an oblong pit about 6 to 8 ft. long, 3 ft. wide, and 6 ft. deep, dug with digging-sticks, and the earth removed in bags or baskets. Wooden spikes, *kipnaiyeinat*, were often set in the bottom, and the whole was covered with thin sticks concealed by a layer of grass and leaves. The trap was dug across a path known to be used by buffalo, the animal it was chiefly intended to catch. This type is no longer used. The springe is the only trap used to-day. It is called *poroet*, and can be made in a very short time by almost any Dorobo. It is used chiefly to catch smaller game like antelope. The materials required to make a springe are wood, liana, and grass, and the only tool used is an axe or *panga* (the long-bladed knife or cutlass common in Africa, and now often used by Dorobo). The trap about to be described was made for me on the edge of the forest at Kipkorom by Coimin arap Katam on 9 July 1938. It took him about 12 minutes from start to finish, and did all that was claimed for it; it should be noted that he was somewhat out of practice, and probably took a little longer than a man who was constantly making traps.

224

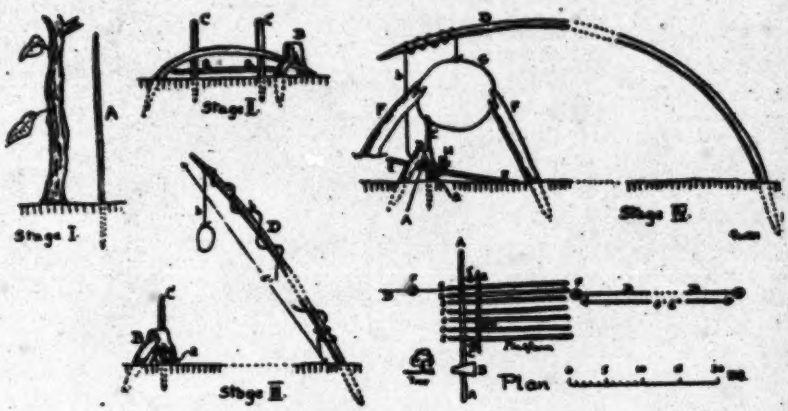

Fig. 4. Stages in the Making of a Springe.

The first step is to cut a stick, A in Fig. 4, about 21 ins. long, chop the thick end to a point, and plant it firmly in the ground in a suitable position where it is more or less concealed by bushes. The second stage is to cut a peg B, bend over the stick A and fasten it down with the peg. Two short sticks CC are then placed 8 inches apart up against A, and another stick *a* is laid on the ground beside them to form the base of the platform. A pliable stick D about 6 ft. long is then planted in the ground 5 ft. away from *a* and a piece of liana *bb* is tied to it. Next, a number of sticks, EE, about 12 ins. long, is laid at right angles to *a* resting on *a* and underneath A to form the platform. Two split sticks FF are fixed on each side of the platform to hold the noose. Stick D is bent over, the noose G is slipped into the cleft sticks, and a length of liana from the end of D is tied to peg H which is placed against A and *a*. Finally, *a* is raised off the ground, and the platform, now set for action, is covered lightly with grass and leaves to conceal it. When an animal treads on the platform, the pressure on it pushes *a* to the ground, and the lower end of peg H is thereby released, with the result that the bent end of stick D is allowed to spring up. The animal as it treads on the platform simultaneously puts its head within the noose which quickly tightens round its neck as D springs upright, and the animal is thus suspended and unable to escape. Frail as such a trap may seem, it is strong enough to catch animals and hold them till the trapper comes to see what has been caught.

The wood used for making such traps is cut from one or more of the following trees: *kimoluet* (vangueria edulis), *ceptuiyet*, *ketuyuwet* (Nandi, *martii*); the liana is taken from the *ndorokiat* tree when possible. A simpler form of the same trap is shown in Fig. 5, in which there is no "trigger-peg" like H in the preceding example, but instead a short upright stick to which is attached the end of the liana; the stick is pressed back by the platform

6:Huntingford E-5 (1938-1939) 1953 FL6 Dorobo FL6

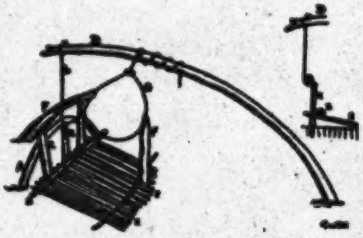

Fig. 5. A Simpler Kind of Springe. This trap has no "trigger-peg". The animal treads on the platform and by so doing presses it against the upright K to which liana b is attached, thus releasing the liana and allowing the bent stick D to spring upright and tighten the noose round the neck of the quarry.

when an animal treads on it, allowing the liana to slip over the top and thus release the bent stick D.

Hunting parties might be made up by as many as eight men, though I think that probably four or five was a more usual number. A common practice was for half the party to work along one bank of a stream and the rest along the other bank, so that if there was nothing on one side, those on the other side might be more successful; or if the quarry got across the stream, the men on the other side would be able to deal with it. When a kill was made, all the hunters assembled. The animal was skinned, the meat cut up, and some of it eaten on the spot, either raw, or partly cooked by laying it across a rough wooden framework over a fire. The rest of the meat was divided among them and taken home. In the best days, when meat was plentiful, what was left over was dried and kept either as a reserve or else exchanged with the Nandi for eleusine and millet. A stack of dried meat (*sirikeniot*) about 2 ft. square, was sold for about 25 lbs. of grain. Meat is cut into strips (*sir*, whence *sirikeniot*) which are laid out on the drying tray or loft over the fire to be smoke-cured after being dried on the roof of a hut or in the fork of a tree.

c) Agriculture

Since they can no longer hunt, and present conditions are[18] not favourable for the acquisition of cattle on a large scale (even if the Dorobo had the means of so doing), the adoption of agriculture has become an economic necessity, and methods, implements, and seed have been obtained from the Nandi. This change from hunting to agriculture has taken place virtually between the years 1927 and 1938. In the first of these years the area cultivated by them was so small as to be negligible; but by the latter year their lives were, as we have seen, to a great deal centered on agriculture. And as with hunting in the old days, so with agriculture to-day, the growing of crops is naturally regulated by the wet and dry seasons and the main divisions of the agricultural year are:

January to April: preparation of the land.
April-May: planting.
September: reaping.

[18] This refers to the years 1938-39.

6:Huntingford E-5 (1938-1939) 1953 FL6 Dorobo FL6

423 It will be seen from the map that honey-barrels and traps are the main forest activities, the shambas being outside the limit of the trees.

The Dorobo had developed a habit of saying that there were no honey-
[231] barrels in the forest. Certainly this would seem to be true to anyone who goes through the forest along the main track from Kipkorom, for there one sees no sign of any activity at all. But on the other track, where few but Dorobo go, there are plenty of them, especially in Area I where Arap and his brothers are very active, several of the barrels near the path belonging to his unmarried half-brother Kipungei. In Area II there are not so many, because Arap Minin regards himself as an old man by now, and unable to
[886] work much (he is actually — in 1939 — about 40); his brother Arap Ruto works on a farm and is less active in the forest than Kipungei. But Arap Minin has at least two honey-barrels, which he showed me, as well as a trap
[487] in which not long before he had caught a bushbuck. A few paths branching off the main track which had once led to traps could still be distinguished, though they were not used in 1939. In Area III there was a new path leading to a trap made by Arap Singira some way from the track. In Areas VI
[361] and VII some of the people still live in the forest in the old type of Dorobo hut, the *koconget*.

Now these areas are not very extensive. The space of forest occupied by Areas I-IV is perhaps not more than six square miles or thereabouts, and that of Areas V and VI may not be more than four square miles. But a mile on the map is a very different thing from a mile on the ground in an African forest. The Dorobo have been forced by economic pressure to concentrate; and since the adoption, even on a small scale, of agriculture, the dependence on hunting has naturally been reduced. In addition to each forest area must be reckoned the strip of open land where they live, cultivate their little shambas, and herd their few livestock. Moreover the central and unoccupied part of the forest is open to anyone who chooses to hunt there, though there were no indications in 1939 that they actually did so. In the old days the
177 forest areas may have been larger, though when all the *korosuek* were occupied
423 there cannot have been very much difference in size. But a relatively small area is enough for bee-keeping, trapping, and food-gathering, and it must be remembered that in the past, before the forest people's economy was disturbed,
● [224] they ranged much further afield to hunt with bow and arrow than is possible to-day, and the forest was primarily regarded as a trapping area. Various statements leave no doubt that the Dorobo used to hunt right over Nandi and Uasin Gishu, as well as in the high country east of Timboroa. Thus, though their own territory was limited in extent, their dry weather range was wide, and the supply of game more than adequate to their needs [22].

114 [22] This paper deals with conditions that existed up to 1940; the use of the present tense must be taken as referring to that period.

/54/

58. The Dorobo

The last name on the list of predecessors in the occupation of the land now held by the tribes of the Unit is Dorobo. Here again there have been much confusion and lack of definition, and in spite of the continued existence of 'pockets' of so-called Dorobo in many parts of East Africa we find ourselves beset with difficulties if we try to give a synoptic ethnological interpretation to the very numerous facts. Some would lump all the Dorobo together with the other trapping tribes and call them aboriginal hunting people of a Bushman type, explaining obvious departures from that type by infiltrations in varying amounts of Hamite and Negro blood. Others (including many Africans) think that the difference between them and the other tribes is simply one of culture[1], not of origin, that the Dorobo chose to stay a step behind while the others, due in part to population-pressure, moved from the hunting-trapping-gathering stage to that of herding or herding-planting.

59. Joseph Thomson, in Through Masailand, written in 1883 or thereabouts, gives the following account:

> "This tribe - the Wa-ndorobbo of the Wa-swahili - is a small race of people scattered over Masai-land who gain their entire livelihood by the chase. They neither keep cattle nor cultivate the land. The antelope, the buffalo, and the elephant supply them with such meat as they may desire, while they always find neighbouring tribes, less skillful in hunting, eager to exchange vegetable food for game. The elephant, however, seems to be their staple food, and as a rule the Andorobbo are to be found only where those animals abound; as for instance

1. To the Mwimbi at the present time Mwathi signifies a Mwimbi who, while engaging in hunting and trapping, lives in a settled village among the agricultural Mwimbi, while Dorobo signifies a Mwimbi (or anybody else) who lives in the forest and takes no part in agriculture.

/66 cont'd/

"South of the Chania river the position was very different, a few families of Gumba were living here and there in the forest - a fact which even the Wanderobo admit - but they were merely wanderers eking out a precarious existence and hiding from the real owners, the Wanderobo. 101 174

"The Wanderobo were, like the Gumba, a hunting people, but it would seem that they were much more organised and according to their own tradition they had even, in the dim past, definite laws or customs relating to hunting rights... [224]

"The Kikuyu described the Wanderobo as the Athi a Githaka or 'Rulers of the Bush land', and never spoke of them among themselves as the Nderubu, which was the name by which they were known to the Masai. 101

"The word Wanderobo has been used by Europeans in Kenya to describe the various hunting tribes that inhabit the forest zones of the Kenya Highlands, and there is no doubt at all that the name has been used to describe several distinct tribal entities which anthropologists and linguists would have no difficulty in distinguishing from each other on the grounds of law and custom and language. For the purpose of this study we must concern ourselves only with that tribe called Wanderobo by the Europeans, which inhabited the forest lands which later were bought by the Kikuyu, and the descendants of whom are still living in the forest on the boundary of Kikuyu country in the Kijabe region and northwards on to the slopes of the Aberdare mountains. Today only some two or three hundred individuals are left to represent the Wanderobo of this area, and most of them have a greater or less proportion of Kikuyu blood in their veins, but /67/ they still retain many customs which are quite different to those of the Kikuyu and they still speak among themselves a distinct language of their own, although most if not all of them also speak Kikuyu, but with a marked accent. [131] [131] [162] [144] [191]

9:Hobley G-5 (ca. 1900) 1903 FL6 Dorobo FL6

Notes concerning the Elderobo of Mau, British East Africa. 17

By C. W. Hobley, Assoc.M.I.C.E., Local Correspondent of the Anthropological Institute.

101 To the east of Nandi country, in the Mau Forest north-east of Mount Tinderet, live
[224] a tribe of so-called Eldorobo people, who, like other branches of their race, exist solely
[233] by hunting, and possess neither flocks nor herds, neither do they cultivate the soil.
[241]

By the Nandi they are called the Oggiek, and they call themselves the Omotik.
648 They have intimate relations with the Eastern Nandi, and generally speak the Nandi
[191] language: in fact, numbers of the young Nandi men, for whom the free hunting life has
[563] a charm, leave their homes and go and settle among these people for some years, and probably marry Oggiek women. It is thus difficult to discover what is the true
142 aboriginal type of the race. The representatives with whom I have come in contact had, however, redder complexions than the majority of the Nandi, and had very peculiar eyes, which reminded one somewhat of the Mongolian type. In height they averaged 5 feet 9 inches to 5 feet 10 inches.

Their marriage customs are very simple: the suitor merely presents the father of
583 the girl with some beer made from the sap of the "mkindu," or wild date palm, and a few monkey-skin cloaks, or "kaross," and takes away his bride.

9:Hobley G-5 (ca. 1900) 1903 FL6 Dorobo FL6

They are said to be very prolific, having families of eight to ten children, but the infant mortality is so extremely heavy that their numbers increase very slowly; this mortality is probably due to the cold, damp climate of the Mau Forests, which are at an altitude ranging from 7,000 to 9,000 feet.

Their peace ceremony consists of cutting off a dog's ears, and the contracting parties then spatter one another with the blood.

They live principally on Colobus and other monkeys, which they shoot in the forest. At certain seasons, however, they go and hunt big game on the plains, known as the Rangata Nyuki; they wait till the grass is dry, and then burn it to facilitate their hunting. They use poisoned arrows for big game, and unpoisoned ones for monkeys, &c. They train dogs to assist in their hunting, and are very keen to get young dogs for the purpose. They told me that they first gave the dog certain medicine, and the animal could then track game.

They are very clever elephant hunters, and informed me that when they came across an elephant they went off and bathed and scrubbed themselves very carefully to remove all trace of the human scent, and that they were then able to approach a sleeping elephant and spear it with a poisoned dart.

They are most expert in the use of a firestick. The fire is produced in the ordinary way by the friction of one stick spun round vertically in a depression in another piece of wood, which is held firm between the bare feet of the operator; the lower piece of wood appeared to be the juniper of Mau.

A small vocabulary of their language is appended on the opposite page. They use the Nandi numerals.

The prefix "ki," and the suffixes "et," "it," and "ek," are, I think, brought in from the Nandi language, but most of the roots will be found to be quite distinct. Many of the tribe can only speak Nandi, and when collecting this vocabulary in many cases they appeared to have forgotten the Oggiek or Omotik word but gave the Nandi word, and had to consult among themselves and, as it were, hunt up the proper word. The language is thus evidently dropping into such disuse that it will probably become quite extinct in the near future.

C. W. HOBLEY.

200-300 ft. in most places. Once the forest is reached, the slope is gradual, ranging from 8,200 ft. to 8,400 ft., though the main river, the Kipkurere, flows through a valley 1,000 ft. deep. The rainfall, taken at Kapchorua farm about two miles from the W. boundary of the forest, averages 56.54 inches over 9 years from 1929 to 1937: the maximum was 70.33 inches in 1937, the minimum 28.61 inches in 1933; in the forest itself the rainfall is undoubtedly higher. The forest is always damp: mists are frequent, and even in the dry weather it is not always quite dry, a condition which is responsible in part for the rather high infant mortality among the Dorobo. On the edge of the forest are glades with a fringe of thorn trees (acacia robusta), and between the forest and the farms is a strip of land, included in the Forest Reserve, which is suitable for cultivation and stock-keeping. The year is divided into two seasons, *Mwainonik*, the dry season from October to March, and *Iwot*, the wet season, from April to September. These determine both the now obsolescent hunting activities, and the increasing agricultural activities.

B. Economic Activities.

The economic life of the Dorobo may be divided into two phases: (1) the old hunting existence, which began to disappear about 1925 when the Government started seriously to restrict their forest life, and (2) the present trapping-agricultural life in which cultivation is becoming of increased importance.

The economic group is either the elementary family or the domestic family (or, the extended family). Sexual division of work overlaps to some extent, but most of the work outside the settlement is done by men (hunting, trapping, woodcutting, and intercourse with the outside world), while the women do the work inside the settlement, except that they collect all the vegetable food from the forest. Agricultural work is performed by both sexes. Things peculiar to women are: the making of clothes, leather work, and baskets; to men: making weapons and other utensils, digging coloured earth, and putting meat on the fire to cook (though the women look after it once it is on the fire).

[P.192, B]

and by personal ability, and therefore to some extent by their geographical setting. They have no iron ore, no metallurgic knowledge, and so all ironwork is imported from the Nandi. Tobacco, which they like, is not grown as yet, and this too must be obtained from the Nandi. There is a regular exchange of honey, skins, and baskets, for arrowheads, knives, tobacco, seeds, pottery, etc., and a scale of exchange values has come into existence:

1 arrow head is given for a gourd of honey.
1 bundle of tobacco is given for a bag of honey.
1 large pot is given for a large bushbuck skin.
1 small pot is given for a duiker skin.
2 basketfuls of seed for one basket.[1]

Sometimes personal services are given, e.g. a day's weeding in the smith's garden for two knives.

Cattle are obtained from the Nandi, to a limited extent, by a system of gift exchange for furs. The Nandi make friends with the Dorobo chiefly for the purpose of getting honey, and the Dorobo will give some to his Nandi friend without expectation of an immediate return. Presently the Nandi gives the Dorobo a goat, and this exchange of gifts paves the way for further and more important transactions: eventually the Dorobo offers his friend a fur cloak for an ox, as e.g. my friend Arap Minig acquired one from a Nandi called Kapkile at Ollesos; he also got another in exchange for 7 goats, which he bought out of his wages for working on a farm.

C. *Techniques*

1. Hunting

The dry weather, *sumainonik*, is the shooting season, and the wet weather, *imot*, is the time for trapping. The weapon is the bow and arrow (spears are not used by the Kapchepkendi Dorobo), and the hunters use dogs.

In wet weather buck are caught in traps. In the dry season, wild pig of various kinds[2] were

[1] A honey-bag is about 12 ins. deep, and 8 ins. wide; it contains about twice as much honey as a gourd. A basket (kerepet) is about 6 ins. deep and 6½ ins. wide at the top.

[2] *Tumda*, the wart-hog (Phacochoerus aethiopicus); and *Torot*, the giant hog or bush-pig (Hylochoerus Meinertzhageni).

14:Huntingford E-5 (1938-1939)1942
[P.193, A]
FL6 Dorobo FL6

hunted by concerted action, and still are, to a limited extent, by individuals, as well as several species of monkey.[1] There seems to have been no very strict close season, as pig were occasionally hunted in the wet weather, though not often, since the forest is difficult to traverse when wet. There are now no lion or elephant, but they are said to have existed when the Sawe and Kipkoii-met ages were young men, i.e. about 1860. Leopards are still common, and are still shot if one runs up a tree after being put up by dogs; they are sometimes caught in traps made of wire, which is not bought, but searched for or stolen from farms. However, a trap made by one Arap Megati which caught a leopard during one of my visits was said to be exceptional. Buffalo no longer exist in the western end of the forest where the Kapchepkendi live, but they occur near Londiani, a few miles to the east.

Hunting parties varied from two to eight men. If, say, eight went out, half would go along one bank of a stream, and half along the other bank, so that one or other party would be sure to get something. They met after the kill, and cooked the meat and ate some of it on the spot. The rest was divided among the hunters and taken home for their families, the unsuccessful members of the hunt receiving a share from those who made the kill. The hunter has to provide, not only his own (elementary) family, but also his father, mother, and wife's father with meat, and the distribution of meat in order of priority, is:—

Hunter: *Meat to*

1. Wife and children.
2. Father and mother.
3. Wife's father.
4. Neighbours (clansmen).

A man has (or had till they were evicted by the government) an hereditary right over a piece of forest, which included hunting, trapping, bee-keeping, and food-gathering. Other people who wanted to hunt there asked permission to do so, for otherwise the right-holder might kill anyone

[1] *Saiwet*, Colobus guereza;
Chereret, Cercopithecus grieo-viridis;
Tisiet, Sykes' monkey or Cercopithecus albigularis;
Konokchot, the baboon, Papio cynocephalus.

he found hunting on his area, though he would be liable to pay blood-cattle for homicide.

As for trapping, it is said that nobody steals meat from traps because their bellies would swell to a great size if they ate stolen meat. Public opinion, too, is strongly against such a mean crime, and is of itself a powerful deterrent. Nowadays trapping is the chief source of meat, and the common practice is for a man to set three or four traps at a time in different places, and to visit them every two days or so to see if anything has been caught.

Monkeys and buck[1] are killed for their meat and skins; pig provide meat and gut for bow-strings.

2. Agriculture.[2]

The Dorobo are in process of changing from a hunting to an agricultural existence, from the uncertain hunting economy to the more certain one of agriculture; and the same economic pressure which has forced them to till the soil is now encouraging a desire for cattle, which are being slowly and laboriously acquired. This leads in turn to a more self-supporting state, with less dependence on the Nandi for grain crops; and agricultural techniques, both in tillage and stock, are being learnt from the Nandi and from Europeans.

Both sexes work in the cultivated plots (*imbaret*), and are helped by children, who weed the crops, herd the stock, and milk the cows. The crops grown at present are eleusine (*eleusine coracana*, called *wimbi* in Swahili) and maize; millet and tobacco are still bought from the Nandi, from whom the Dorobo also get eleusine and maize seed when necessary. Unlike the distribution of the forest into hunting areas, people cultivate the ground close to their own homes, and a group

[1] The buck killed are:
Kipseket, blue duiker (cehpalophus aequatorialis).
Mindet, red duiker (c. igna-isaaci.)
Keremaïit, bush buck (tragelsphus scriptus.)
Irukutet, reed-buck
Kenyelet, oribi
Kipsomeret, water-buck (cobus ellipsiprymnus).

[2] I prefer the term 'agriculture' to 'horticulture,' for the latter implies mere cultivation, with no livestock, and in East Africa agriculture is almost always practised in conjunction with stock-rearing, even if only on a small scale.

[P. 196, A]

Economic life to-day is centred more and more on the *imbaret* than on hunting. 241 423

The family group is interdependent: the men trap, make tools, protect the family; the women look after house and children, and prepare food; the children, while dependent on their parents for existence, help them with the *imbaret* and livestock, and in various other small ways. 592

There is little specialization, since all men can make traps and honey-barrels, and all women can make baskets. Joint-production occurs in (1) house-building, when the whole family takes part; (2) cultivation; (3) in hunting and in digging coloured earth. Food produced by the family is shared by husband, wife, and children, and also by the husband's and the wife's parents. Meat caught by trapping is divided between the trapper's family and the other people living in the settlement. Vegetable foods are not shared thus, since they can be got by all. Hospitality is given to visiting relatives, clansmen, age-mates (though they do not sleep with their host's wife), and even to stray travellers, once their good faith is established. Beer is drunk at social gatherings of men or women, at clan councils, and on ceremonial occasions. And just as meat is distributed in a particular way (p. 193), so with tobacco: a man who acquires some gives it first to his father, then to his wife's father, and lastly to his brothers and clansmen, if it will go as far. [402] [342] [241] [224] [224] [244] 592 421 574 273 276 [431]

The typical Dorobo hut, *kochonget*, is extremely simple, being no more than a framework of sticks covered with leaves, and a hide on top. They are now building larger and better huts of Nandi type, sometimes with unplastered walls; and an intermediate form may be seen, with a nearly flat roof. 342 [177]

D. THE MAGICO-RELIGIOUS ASPECT OF ECONOMIC

That the Dorobo had hunting magic is certain: old men say that some had it, while others had none; my friend Arap Minin, for example, says he was one of those who had none. Since hunting is the one phase of Dorobo life that appears to be gone for ever as a result of government action (in spite of sporadic individual activities), this important aspect is, I fear, irrecoverable. 224 [178] [648]

14.Huntingford E-S (1930-1939)1943
[P.196, B] FLS Dorobo FLS

important aspect is, I fear, irrecoverable. I have been in the forest in both wet and dry seasons, and while trapping is still carried on, I *could* see no sign of hunting (i.e. shooting), and the description of a hunt is from narration.[1] Fear of a government which forbids hunting, and has of late itself hunted the Dorobo, has, I think, effectually sealed the lips of one or two who would normally have spoken on the subject. My informants, however, did say that sexual intercourse was forbidden before setting out on a hunt, though not before or during the process of trapping. In hunting there is an element of personal danger and of uncertainty as to success; magic helps to give confidence, and abstinence to avert ill-luck. In trapping the process is mechanical, largely a matter of technological skill, and with little danger to the trapper, who is sure to catch something sooner or later.

On the other hand, it is believed that both *Asis* (god) and the *chesomiki* (both the good ancestral and the bad elemental) can influence a man's hunting, and before starting out to set a trap, he will say:

Asis, ipiyech paiyek,
God, give-us-enough meat,

or,

Chesomiik, okhuuch tiony ne kipare.
The-spirits, give-us a-beast which we-may-kill.

Honey (*kumiat*) is an important article of Dorobo diet, and provides both food and intoxicant: it is to them what milk is to a pastoral people. It is not stuff that can be picked up anywhere, but requires a certain technique, and, above all, the presence of bees in a suitable place. As, therefore, it has an actual social value, so it has acquired a ritual value, and certain observances are necessary if the supply of honey is not to fail. First, you must have your bees, and a man who has put up a new honey-barrel must take steps to ensure that it is inhabited. This he does by calling out, in an unnatural high-pitched voice, "Bees, bees, all you who are in this country, Come now and make honey here."

[1] Leopards, as already mentioned, are killed occasionally when they become aggressive and threaten livestock; but there are no organized leopard hunts, and in any case leopards are vermin.

M 563 D 224

Before closing this chapter it may not be out of place to say a few words regarding a tribe of people whom I have referred to as the Andorobbo. This tribe—the Wa-ndorobbo of the Wa-swahili—is a small race of people scattered over Masai-land, who gain their entire livelihood by the chase. They neither keep cattle nor cultivate the land. The eatabaga, the buffalo, and the elephant supply them with such meat as they may desire, while they always find neighbouring tribes, less skilful in hunting, eager to exchange vegetable food for game. The elephant, however, seems to be their staple food, and as a rule the Andorobbo are to be found only where those animals abound; as, for instance, in the dense forests of Kenia and Kikuyu, the forest-clad escarpment of Mau, the top of Elgeyo, Maragwet, Chibcharagnani, Buru, Dondoli, &c. They are rarely found in numbers, and usually in very small villages, so that there is nothing like tribal life among them. They enjoy considerable immunity from attack by the Masai, as they are sources of wealth to the latter by attracting the coast traders; usually, too, the Masai fall heir to a considerable share of the ivory. They also act as go-betweens or middlemen in getting the married people the vegetable food they require. To such an extent is this system carried, that on the plateau to the east of Naivasha, at the place called by the traders Mienzi-ni, a very large village of Andorobbo have altogether given up hunting, and subsist entirely by buying vegetable food from the Wa-kikuyu and selling it again to the Masai, or it may be the traders.

D [131] [341] M 563 D 439

M 563 D 192 105

The language spoken by the Andorobbo is allied to that of the Masai, but they can all speak the latter in its purity. They build regular villages, and in general appearance they resemble the inferior class of the Masai. As I have already remarked, they make the buffalo-hide shields of the warriors, as well as the coarse earthen cooking-pots of the women. They are on the whole looked upon as a species of serf, and treated accordingly. Their transactions with the traders must be done secretly, or everything would be stolen from them.

D 224 711

In hunting the elephant the Andorobbo use a peculiar weapon. In shape it is like the runner of a canoe, the heavy head being intended to give additional weight in dealing a blow. In the thickened part is placed a weapon like a short but thick arrow, fifteen inches long, the head of the arrow being smeared over with the deadly poison of the *mwiya*. The whole spear is little short of eight feet. With this the

6:Thomson K-3 (1883-1884)1887
FL12 Masai FL12
Wa-kwafi
Dorobo FL6

elephant is attacked at close quarters, the arrow part driven into the great brute, and being loosely fixed in the handle, it remains when the latter is withdrawn. Another arrow is then affixed, and the same operation performed. It is said that an elephant will live a very short time after being thus stabbed, and entire herds are killed without one escaping, so dexterous and daring are these hunters. The Andorobbo also use the ordinary bow and arrow, but only for the smaller game.

D 224 411

CHAPTER XI.

THROUGH KAVIRONDO TO VICTORIA NYANZA.

M 101 184

THE people (Wa-kwafi) of Njempe presented an interesting study to the observer as throwing light upon the origin of the various small tribes which people Africa. Unquestionably Masai in race, and only separated from that tribe through the loss of their cattle and the consequent necessity of breaking their cherished convictions by cultivating the soil, they had developed new ideas, manners, and customs in a comparatively short period.

M 142 184

They did not by any means supply an argument in favour of the vegetarians; for in personal appearance they had distinctly degenerated, and could not for a moment compete with their aristocratic carnivorous brethren of Lykipia. This was especially noticeable among the women, who had lost their slender, *genteel* shape and acquired the ill-proportioned, unwieldy contour of the negress. Perhaps an exception might be made in favour of the young women, many of whom were well-formed and characterized by most pleasing and interesting manners.

M 361

The colony consisted of two villages—Njempe of Guaso Tigirish, close to our camp, and Njempe of Guaso na Nyuki.

M 342 351

The houses were of the beehive order, with floors beneath the level of the ground, very small and badly built. They were surrounded by a double fence of thorns, which, however, are a greater source of danger than of protection, as in this dry climate they become like tinder, and consequently can be set on fire easily. If this were done at several points simultaneously, the inhabitants could easily be burned to death.

M 184

In a hazy sort of way they tried to keep up the distinction

Dorobo PL8

/1/

M 174 In three mighty corps that followed one another at long intervals, the Masai people came from the north drawn toward the
D 174 equator. The long separation from one another in space and time, their different length of residence in the new East African homeland, and the different shaping of their fate conditioned by that make them appear to us today as three branches of the Masai people.

D 174 [101] The remnants of the earliest immigrant band are the Aaá, more generally known under the name of Wandorobbo /Wandorobbo/ (a Bantu formation from the Masai word El dorobo : the poor), of whom they form only a part.

D [233] Although the tradition of the Aaá has nothing to say about a former possession of livestock, one must nevertheless assume, especially on the basis of their ethnography, that they immigrated as stock-raising nomads and, as such, took possession of large parts
D [648] of the steppes. Wars among themselves, livestock epidemics, and, finally, the pressure by the Taturga weakened the Aaá to such an extent that it was easy for the second band of Masai, the El kuafi, the first sections of which were the El kuruboa, and the later ones the El mulli, when it came in, to drive out the ruined ones alto-
D [224] gether. A part of them found refuge among the neighboring agri-
[735] culturalists, with whom they merged, another part among their oppressors, who adopted them as members of the tribe: the rest, however, withdrew into the forests and bush of the steppes, where still today, in great poverty, they make a poor living by hunting.

M 174 184 648 [731] The fate of the Aaá, however, was not to be spared the El kuafi either. After a rather long period during which they competed with the Taturga for dominion in the steppes, the rinderpest appeared again several times and, as before, brought poverty and death. And again, as before, the one misfortune did not remain alone. The third band, the El mûsi (sing. ol mûsi), immigrated here from the north, and it looked as though it would rapidly complete, by means of bloody fighting, the destructive work of the epidemics. But the presence of the Taturga, who in places were just as powerful as they were feared, diverted the bellicosity of the Masai. They joined the El kuafi for the common fight against the former.

/229 cont./

184 The fact that in many things the Asá served as a model for the latter two and that the El aalti also often designate themselves as Asá follows
• [224] from the circumstances. They are both merely /230/ hunters, whereas
[233] among the El gamurak the tendency toward animal husbandry has still been preserved here and there.

128 In the following, for obvious reasons, only the Asá will be discussed.
197 Therefore the accompanying native words have been taken from the Asá idiom.

613 The fact that the Asá are divided into the same tribes and lineages
219 as the Masai and Wakuafi and that they also regard the ol oiboni[A] as
291 their chief has already been mentioned at the beginning. It is to be

Ill. 60. Wanderóbo men.

[A] 1. [i.e., the chief of the Masai people--Analyst]

/230 cont./ It is to be
613 noted, however, that there seems to be no El kiboron among the Asá,
171 as is shown by both the consistent assertions of the people and the observations of the author, who did not find any members of that lineage among them anywhere. The respect and esteem that the El kiboron enjoy among all the Masai people sufficiently explains the fact that, with the displacement of the Wandorobo at the time, they were adopted into the community of the oppressors.

/231/ II.

000 Plan and arrangement of the camp. -- The huts. -- Household equipment. -- Daily life, food, work. -- Earthen pots. -- Baskets. -- Leather dressing. -- Market trade. -- Honey extraction. -- Manufacture of bows and arrows. -- Spears. -- Dance and song.

361 The Asá roam the steppes as hunters, in that they wander with
[224] the game, whose meat gives them food and out of whose skins they
[237] make their clothing. This circumstance brings along with it the fact that they can not live together in large kraals, but rather, divided into small bands, are forced to stay here today and in a
[342] distant place a few weeks later. Accordingly, their camps (aijo) only consist of hastily built small huts (morõg) that are made out of branches and grass. The camps as a rule are hidden in dense
[487] bush and have no special enclosure. The paths and game runs leading to them are carefully barricaded with thorn branches and thus made inaccessible. Only the practiced eye of the Asá will find the wonderfully concealed entrance to the camp.

621 Only two or three families, rarely a few more, usually live in
[591] one camp. Next to their huts are found those in which the unmarried circumcised men (dobonog) live with the young girls. As among
[192] the Masai, each young man has his favorite girl. He calls her
[171] sanjet uan, she calls him sanjeg uan, words in which one again finds the Masai word sandja. Their huts are designated as morog

/231 cont./

621 to dobonog, i.e., huts of the unmarried men, in contrast to the
[192] aija to daĩma, the camp of the married. Therefore here, too, we
[171] find, even in the name, a separation into kraal of the married and kraal of the warriors, similar to the one mentioned for the Masai.

171 The arrangement of the interior of the hut, like the form itself,
353 resembles that of the Masai; its furnishings, however, are even
415 sparser. A honey pot (madjé, madjeog), a gourd bottle (mget) for
237 drinking water and honey beer, a leather bag (lebenu, lebenua)
283 for collecting honey, a larger one (ndaro, ndareraũg) for water, a
352 few earthen pots, larger ones (idug, idia) and smaller ones (ruguba,
412 ruguba) for cooking, a couple of wooden bowls (tagi), a rope cut out of an animal skin (scharu, schâruga) to tie up the slain meat, a cord twisted out of the bark fibers of the baobab (Adansonia digitata) for the drawing up and letting down of the beehives hung in trees (meriñgo), along with a few dehaired skins (fulót) that serve as beds, as well as ax (haũo, hauereg) and knife (pandyug), constitute the
492 principal household equipment. In a few huts one also finds the en
412 dereta /pack-holders/ of the Masai, here called lalaho (leleweg),
413 as well as a hammer (giribêt) for forging and a chisel for designing
177 the arrow points (mad, mara), and finally that sharpened small piece of sheet iron serving as razor-knife (herá, hererá). The entire family,
592 namely, husband, wife or wives, and the uncircumcised children, live in one /232/ hut. Men and boys, however, are usually out.
512 The day begins even before daybreak for the hunting men. They
[224] set out with a snack consisting of a little piece of boiled or roasted
[264] meat, so that the first light of day already finds them in the hunting
[825] grounds. The game now behaves best; as they say, it then feeds more eagerly and carelessly than a few hours later, when the sun already becomes annoying to it. At daybreak women and children leave the huts; firewood and water are carried up in order to cook
[251] the meat fetched from a larder located in a nearby tree. The meat is kept there and not in the camp, so that it hangs in the air and
512 thus remains fresh longer. After that the morning meal is eaten.
264 Actually the Wandorobo do not have definite mealtimes: as long as there is something edible they simply eat as long as they can.

/239 cont./

IV.

000 Marital relations. -- Polygyny. -- Betrothal. -- State of being betrothed. -- Conversion of the young men to the state of the married. -- Bride price. -- Forcing the consent of the father of the bride. -- Exchange of wives. -- Obstacles to marriage. -- Entering into marriage. -- Dissolution of the marriage.

595 The marital relations also offer little that is new. Polygyny exists only to a limited extent; most of the people are too poor to acquire and support more than one wife; only a few have two wives, 584 and if a man has three of them it is a rarity. Betrothal in earliest 171 childhood seem to be more frequent here than among the Masai, but no more binding and without legal consequences. As a rule after circumcision the youth is betrothed to a girl eight to ten years old, after his father has proposed for him to her parents. As among the Masai, the /240/ betrothed persons live apart and may not even see each other. The bridegroom lives with a girl in the one camp, and [836] in the other, the bride with another youth. If the bride becomes [848] pregnant before the wedding, dissolution of the betrothal does not [684] always take place, as among the Masai, but rather the one who made her pregnant must reimburse the bridegroom by the payment of a head of cattle.

561 Here, just as among the Masai, the young men of an age class 582 together decide upon their entering the standing of the married, and 574 their fellow campmates confirm this intention by a feast corresponding to the ol geteñ l ol bɛ, in which friends and neighbors participate. [273] They are served game and honey beer, the latter of which, however, the marriage candidates may not yet drink. They like to set the [224] feast for the day after a successful elephant hunt, so that the guests can feast heartily on meat.

583 Before marriage can be entered into, the bride price is to be [439] paid. The bridegroom usually gives the father of the bride, even before her circumcision, five pots of honey and five beehives, and, soon after her circumcision, half of a slain female elephant with the tusk that belongs to it; furthermore, two head of cattle, which

/241 cont./

V.

000 Pregnancy. -- Behavior of the pregnant woman and her husband. -- Care and treatment of the pregnant woman, the woman in labor, and the woman in childbed. -- Killing newborn children. -- Fertility. -- Child mortality.

843 [842] [824] The opinion that the author heard expressed a number of times by Asá-Wandorobo, that pregnancy is more or less bound up with a definite time of year, and, to be sure, in such a way that either conception takes place at blossom time or birth takes place at the time of the fruitage of the poisonous tree Acocanthera abyssinica, appears surprising.

[224] /242/ During his wife's pregnancy the husband does not pursue a game animal shot at in hunting, because it is believed that the latter, at his approach, will resist the poison and escape. Therefore, after he has shot an animal, he returns to the camp and from there sends another man out to look for the animal. The pregnant woman [825] may not be beaten. Neither he nor the pregnant wife may step over a procession of migrating ants. She is forbidden to eat meat from a wild animal that died or was killed by a predatory animal, likewise soup, and furthermore honey in which dead bee larvae are found. She must avoid coming near a chameleon or a snake, or exposing herself to the heat of the sun for any length of time. All this, in the opinion of the Asá, would harm the fetus.

[302] [202] If the woman visits another camp, she smears her forehead with white clay beforehand in order to announce her condition to its occupants. On the way there she is accompanied by a little girl, [858] [825] whom she leads by the hand. As the reason for this, the people say that a miscarriage would take place if the woman went without a girl and on the way saw the previously mentioned weaver bird or heard its dil-dil-dil calls. A woman pregnant for the first time is 843 431 given gifts by all the people (men, women, boys, girls) of the camp and her friends in the neighboring camps at about the middle of her pregnancy. She is presented with a leather apron, a pair of ear pendants, beads, chains, or even a head of small livestock.

/243 cont./

551 named after the oldest living child. Among the Asá one likewise finds the custom whereby the son, after the father's death, is called by his name.

/244/ VII.

000 Circumcision of the boys. -- Age classes. -- Organization of the circumcised young men. -- Circumcision of the girls.

881 171 561 The circumcision of the boys and girls is exactly the same as among the Masai and takes place at the same time as that of the Masai boys. The newly circumcised boys (bogodendet, bogododig) form an age class (ebindadet), which borrows its name from that of 56 17 the Masai. For two to three years after their circumcision the boys are called barnotig (sing. barnotendet), corresponding to the el barnot of the Masai. When the latter become el móran, the former correspondingly become dobonog (sing. dobonatog), and later, with their marriage, daĕma (sing. daĕmog), corresponding to the el moruak of [291] the Masai. The bogododig dress exactly like the es sibolio, and, like [223] them, they set out to hunt small birds, with the skins of which they adorn themselves. When the corresponding age class (ol boror) of the Masai gets a new name, that of the Asá adopts it also. They [178] cling to their old customs even when their present mode of life makes [791] them unnecessary. The reason the Wandorobo have no names of their own for the age classes is -- also according to their own explanation -- that the ol oiboni,[1] whom the Asá also call ndĕarug, does not give them any and would regard it as extremely audacious if these poor, despised people came to him with such a request. The ebindadet also choose their head -- the ol aunoni of the Masai -- who here is called njīg or kisiridjo or also aunoni. As among the Masai, this is an honorary position without duties, but here without any privileges [692] either. Here the kirua kidet, whose task is chiefly to settle disputes, corresponds to the ol aigwenani of the Masai. The kirigit corresponds [224] to the ol oiñoni of the Masai. He is the leader in hunting, especially [555] on larger expeditions, which often lead the young Wandorobo in pursuit of elephants far from their camp. Only one who, in hunting

1, [Chief of the Masai people, and according to Merker, also chief of the Asa--Analyst]

561 /244 cont./
171 elephants, buffalo, and lions, has distinguished himself through
• 224 courage and decisiveness and who shows these qualities anew again
555 and again is elected kirigit.

881 About the circumcision of the girls, it is only to be said that, adorned, a few days before the operation they set out for the neighboring camps to bid farewell to their younger girl friends. On these
[425] visits they are permitted to appropriate anything that they wish (food, clothing, ornaments, etc.), without special permission from the owners.

Concerning the reason for the circumcision the Asá also say that God commanded them to undertake this on their children.

/245/ VIII.

000 Hunting. -- The weapons, bow, arrow, hunting spear. -- Ownership marks. -- Preparation and effect of the arrow poison. -- Treatment of arrow wounds. -- Stalking. -- Hunting dogs. -- Station. -- Battue hunting. -- Practice of hunting. -- Game. -- Superstition, -- Meat meals of the hunters in the bush.

411 For the dobonog of the Wandorobo hunting is what war is for the
[561] El móran of the Masai. Their principal weapons are bow and arrow.
[224] The two-sided bow ([Fig. 83] gari, geleweg) has the shape of a flattened segment of a circle. It is as a rule 1.50 meters long and very sharply flexible. With it belongs a leather quiver ([Fig. 85] madiet, madimoig) with arrows ([Fig. 84] mat, mara). The wooden arrow-shaft bears a small notch on its rear end for setting it on the bow string, and directly in front of it the three-part feathering (haiya).
[439] The iron point, which the Wandorobo usually buy from Wakuafi and Masai blacksmiths, but also from sedentary Negroes, and more

/245 cont./

411 [439] rarely also make themselves, as a rule has the so-called arrow shape. It bears either a short, flat tang, which is lengthened by insertion into a cylindrical one ten centimeters long, or else the latter and the point are worked continuously out of one piece. Now an and then one also finds arrows among which the extension tang is made out of wood. These come from Ukamba, where the Wandorobo, who call them mijerá, have bought them. The tang is stuck loosely in the arrow shaft so that the latter can fall off when the animal has been hit. Less frequently they use wooden throwing-spears (Fig. 86) with a loosely inserted, poisoned iron point, which, like the arrow point, remains sticking in the animal hit, while the wooden shaft falls off. They also attack the sleeping rhinoceros and hippopotamus with a sharp sword, which they tie on a stick and use as a thrusting or throwing spear. One leaves this weapon sticking in the wound so that, if the animal flees, it cuts the entrails still more by striking on the ground and against the bushes. Both types of spear are called muschúg. Both the point and tang of arrows and throwing spears bear a filed-in ownership mark (Plates 5 and 6), by which one can recognize tribe and lineage of the owner, in order, upon finding a slain head of game, to determine its hunter. Like the ownership marks on the cattle and donkeys of the Masai, the symbols here are not the same for all Wandorobo, but vary more or less in the individual

[439] →

/247 cont./

arrows, not in the hut, but hung on a tree not far from the camp. Only in rainy weather do they bring the things into the kraal and keep them there in the hut of an old woman who herself, in their view, can no longer come into consideration in the above respect. They even make themselves responsible, relative to the intensity of the sexual intercourse, for the slow dying of the animal struck by the poisoned arrow. The poison is smeared on the arrow point with a wooden spatula, and, in order to protect the dried substance from crumbling or from dissolving in damp weather (since it is very hygroscopic), it is wrapped with a strip of thin antelope skin that is dehaired and made soft by being rubbed with fat. The poison acts very quickly, and, to be sure, by suddenly stopping the heart activity. In the case of a genet shot in the abdomen, breathing difficulty set in after five minutes, along with rapid movements of the nostrils and violent, cramplike muscle twitchings of the body and limbs. With brief interruptions of a quarter to a third of a minute the symptoms were repeated and increased in intensity. The pupils dilated to a circle. Nine minutes and 18 seconds after the shot the pupils, up to then blue-black, suddenly became sea-green, and, with violent twitching, death came. With quite fresh poison death is supposed to come in even a shorter time. In the steppe the poison is tested by shooting an antelope with an arrow newly poisoned. If on the trail of the fleeing animal one finds fresh urine and excrement, the poison is regarded as acting too weakly. Good poison put in the foot of a live turtle must lead to its death before it has crawled five or six steps away. Neither the Asá nor the Wandorobo are acquainted with a physiological antidote. For smaller, simple, and penetrating flesh wounds immediate washing with fresh urine is supposed to help. Aged Wandorobo often showed me scars on their own bodies, especially on arms and legs, which are supposed to have been caused by shots with poisoned arrows two to four centimeters deep. Both the appearance of the scars and the corresponding statements of people, which were separated in time and place from the former, corroborate this information.

278 411 224 [230] [281]

278 752

/247 cont./

278 415 252 [411] 224 [634] [631] When the cooking of the poison is finished, the pot is cleaned with sand and water and used again for the preparation of food. The arrow point is thoroughly cleaned, heated red-hot, and poisoned anew.

The region in question for hunting has been divided by the El dorobo into definite districts, each of which may be hunted in only the community of its inhabitants. A district, in turn, consists of a number of precincts, whose grassy plains are burned off in a sequence following from their location, the weather conditions, etc. The wild animals then gather to graze on the grass soon freshly sprouting after the burning. This management explains why the hunter is only rarely /248/ forced to return home without booty and why he is able to feed his family continuously and regularly from the yields of his hunting.

The game in general in East Africa is game frequenting the same spot; but the meaning of this statement must be modified in accordance with the relatively enormously large areas here. Just as in Germany a hunter expects a herd of deer at a particular time on a particular knoll, the ol doroboni can quite certainly count on finding the game expected by him at the appropriate time in a region whose diameter amounts to approximately 3-5 kilometers. Considerable disturbances [136] are caused, of course, by the appearance of large predatory animals, especially lions almost always hunting in herds and the hyena dogs always hunting together in larger numbers.

In practicing hunting the men split up in such a way that the younger ones do the stalking on the open steppe, whereas the older ones lie in wait at the watering places of the game. Stalking requires incomparably greater endurance and skill than at home. The ol doroboni must more accurately watch the wind, since his own strong odor makes it extremely easy for the animal to pick up the scent. He must take the greatest pains to conceal himself from the sight of the animal, since he is unfamiliar with any kind of adaptation to the region and the surroundings, so that his black body stands out clearly, even at great distances, on the usually light yellow steppe. The difficulty of the rush is further increased by the primitive nature of his weapons, which permit him to make an accurate shot only at 20 to 30 meters. In what concerns the patience, perseverence, and dexterity that the Wandorobo show in this, a European hunter can

/248 cont./

224 scarcely match himself with them. Frequently, not regularly, the
224 hunter uses a dog in stalking. Set on the trail, it leads its master
231 until the latter sees the game. Then the hunter takes off his leather apron and, while he now creeps up on the game, the dog remains lying beside the apron. As soon as the game has been hit by the poison arrow, the dog is again set on the trail and follows the wounded animal until it goes down. Then it returns and proves itself as death-warner. The hunter now leaves the dog as guard over the slain piece of game, and he himself goes to the camp in order to fetch people to carry home the meat. The Wandorobo either raise the dogs themselves or buy them. One finds two or three of them in every camp. They are regularly taken along on larger expeditions, in order, through their vigilance, to protect from predatory animals the ones camping in the wilderness. The dogs, still young, are led off to where one catches kids. The children then train themselves in shooting the bow
224 and the dogs on the blood trail. At his station near the watering place the hunter makes a small cover for himself out of two branches, which stand a meter apart and are connected with twigs and grass. Crouching behind this, he waits for the game coming to drink, which often approaches individually at very brief intervals, often also in whole herds. According to /249/ statements of the Wandorobo, black-heeled antelope, waterbuck, and wild pigs often come early in the morning; giraffes and elephants come at night. The latter, however, also during the day and, like the rest of the wild animals, toward evening. The antelopes below the size of a small roe supposedly almost never go to the watering places. The hunter first lets the game drink a few moments before he shoots. As soon as the animal has been hit with the arrow, it flees. The other animals, so the ol doroboni relates, think that the wounded one has been stung by an insect and remain quiet. The hunter shoots a second one and a third. Only then do the animals realize where the danger comes from, and all take flight, whereupon he shoots once or twice more. Then he returns to the camp and sends boys back after the wounded animals.

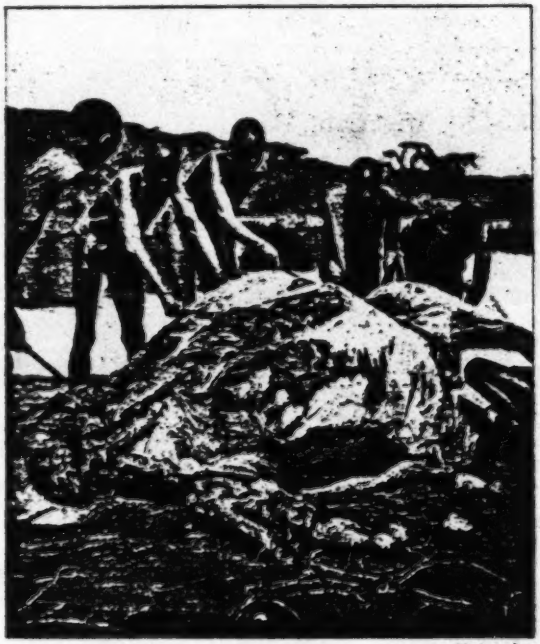
Ill. 61. Wanderobo cutting up a hippopotamus.

From time to time battue hunts are also organized. For this, people like to choose a region where two small streams prevent the game from breaking out laterally to the battue direction. Already at sunrise the game has been surrounded at the rear, and, to be sure, by boys and young men, who now, by shouting and waving scraps of cloth or leather, which are tied to the bow sticks, drive it toward the row of archers, who have buried themselves up to the hips.

A sportsmanlike practice of hunting is completely foreign to the people. Unscrupulously they shoot the calf and the gravid mother animal. The sole purpose of their hunting is to obtain meat. They do not use nooses, pits, spring guns, and traps, for in this way slain game would only /250/ fall prey to predatory animals. The extermination of the vermin is also little to their liking. They loathe its meat -- only the Wandorobo living on the Donjo Kissale are said to eat lions occasionally -- and its extermination seems unnecessary to them in view of the huge multitudes of the constantly changing game. Only the predatory animals dangerous to human beings, primarily the lion, leopard, and hyena, are shot if one happens to encounter them. If a lion makes the surroundings of the camp

[262]

/250 cont./
224 unsafe for several days, the men lie outside the latter in wait at night,



Merker phot.

Ill. 62. Wanderobo cutting up a hippopotamus.

in order to kill it with spears. They do not consider it possible to kill it by laying out meat bait in which arrow poison has been put. Several persons maintained that they had tried it in vain and believe that the lion smells the poison.

As far as the quality of the game is concerned, they are otherwise very easily satisfied. They no more scorn the coarse-fibered 224 262 meat of the heavy pachyderms than the high flavor of an elephant carcass several days old, which even /251/ their giant stomach could not master at the first attempt. Like the predatory animals,

/251 cont./

224 262 they particularly value the entrails and also do not scorn the meat of fallen or stricken animals; indeed, even the skin of elephant, rhinoceros, and hippopotamus is eaten roasted. As huntable, i.e., here [223] [439] edible, the Wandorobo regard elephant, rhinoceros, hippopotamus, pigs, zebras, all cloven-footed animals from the giraffe to the tiny dwarf antelope, hares, rock rabbits, and, of the birds, the ostrich, which, however, they shoot only on account of its feathers, which the Masai like to buy for the manufacture of the war head-ornaments. They do not hunt monkeys and lower animals, because they do not relish their meat.

224 On the day before the new moon, and in places also on the seventeenth day, the ol onjugi, no one goes hunting, because, according to popular belief, one would not kill anything on the former day, [825] [777] whereas on the latter the bow would break. The red-headed Anaplectes melanotis is regarded as unlucky for the hunter. If the hunter sees it along the way he returns to camp immediately and does not leave it again until several hours later, in order to try his luck anew.

561 264 171 [178] Like the warriors of the Masai, the dobonog of the Wandorobo also hold their meat meals in the forest. Whereas among the former, however, these are a result of the food rules, according to which the warrior may not eat meat in the kraal, among the latter it is only a matter of observing an ancient custom for which there is no longer any reason today, since the unmarried man usually eats his meat food in the hut. On the other hand, there is greater justification for retaining [262] [224] the en dorós, where they strengthen themselves by a plentiful eating of meat for a larger hunting expedition for more distant and at the same time dangerous game, such as elephants and buffalo. The [263] [276] many spices and stimulants that we became acquainted with among the Masai are also used by the Wandorobo, but to a far lesser extent. They do not divide up into fellowships for the meals in the bush, but 561 224 only for the hunting expeditions. Each company, as a rule, consists of four men and is called e sirdet, in which one recognizes the present Masai word es sirit. The booty is divided among the participants in [574] equal parts. If an individual hunter or an e sirdet spends the night in a strange camp, the host is given a foreleg and a hind leg of the hunting booty.

/257 cont./

802 Their own words seem not to extend any farther. According to the author's observations, the Wandorobo use these number words especially in counting the pieces of game killed on a hunting expedition, the captured elephant tusks and rhinoceros horns.

[192] [171] What was said about the Masai holds for their ability in reckoning. The Wandorobo designate the fingers usually with the names that the Masai have for them. Of their own designations they know only seŋgetok for finger and sengelá for the hand.

Ordinals are formed from the basic numbers through the addition of the word sătĭsch or kărătĭsch. The first, kinde satisch; the second, ɁIam satisch; the /258/ third satisch sama'; the fourth, satisch hag; the fifth, satisch mut, or kinde karatisch, ɁIam a karatisch. These [192] [171] designations seem to be used only very rarely, in their place people prefer to use those of the Masai language. The Wandorobo express fractions in a way similar to that of the Masai. For multiplication they use the word sigá. Once is called siga kinde; twice, siga ɁIam; three times, siga sama'; four times, siga hag; five times, siga mut, etc.

805 192 For seasons and months they do not have any designations of their own and even use those of the Masai only very rarely, since they do not know any need for them. Of the days they name only the last one • [224] of the month, leheg tagarawasch, on which they do not go hunting. On the other hand, they designate the times of the day with their own words in the following way:

The hour before sunrise, when it is still dark: demog dádi.
As soon as it becomes somewhat light: erená saha.
Sunrise: adjid sauaschasch.
Ten o'clock in the morning: schirahōg.
Twelve noon: adj'odá.
Two o'clock in the afternoon: sadji foa.
Afternoon, particularly the time up to five o'clock: haia.
The time from five o'clock to sunset: adjid saduisch.
Twilight: tara.
Night: e ramesá.

/259 cont./

782 796 842 From time to time the people celebrate a supplication feast for Uɛ̃d, which they call korodjeg or koroseg. For a koroseg a hawa, a feast to ask God for children, the married women station themselves in a circle around a small fire into which, just as for every other supplication feast, they strew the residue of the honey beer, consisting chiefly of wax particles, so that its fragrance will rise up to God. While an aged, respected man goes around the circle and sprinkles those present with honey beer, they sing: Uɛ̃d nge hawa! After this has gone on for a quarter of an hour, they start to dance, continuing to sing the same words. [504] [273] The dance is followed by a meal at which meat and honey beer are consumed. At a koroseg e aga they ask God for meat. Beside a small fire they place upright a straight branch with several forks at the top, the 782 796 twigs of which are cut off short. The empty stick is supposed to show God that they do not have any meat. All the campmates station themselves around the fire and sing: Uɛ̃d ngeri' magat (magat = game). The next morning the hunters set out, and as soon as they bring home meat, a small piece is placed on each twig of the forks of the branch. Again all surround the newly kindled fire and now sing: Uɛ̃d urag haiug ara, which is to say: God, give us still more food. The men celebrate another supplication feast before a larger hunting expedition. In the middle of the camp a small fire is made, around which the men stand [824] in a circle. Each one has the bow in the left hand, a twig of the olti tree (Acacia mellifera) in the right one. Then, going around to the left, they walk around the fire four times, during which they sing: Uɛ̃d ngeri' magat. They maintain that they have never yet prayed in this way in vain, but that after a koroseg e aga they always returned from hunting 789 with rich booty. The Wandorobo do not have a feast corresponding to the ol ogor 1 ol geretti.[1] Rather, without special ceremonies, they cut [796] a strip out of the hide of an animal just slain and wear it as an amulet around the right middle finger. As soon as they meet something along [782] the way that makes them afraid, be it a predatory animal or an enemy, they blow on the hide strip, which is the equivalent of a prayer for protection. Other amulets are seen extremely rarely. The author saw only one, which they called tuturo and which consisted of a small piece of root. It was worn on the neck ring and was supposed to protect one from predatory animals. If individual persons spend the night

1, [A supplication feast conducted by the Masai to preserve the health of human beings and livestock--Analyst]

/259 cont./

789 outside the camp in the steppe, or must leave a slain piece of game /260/ outside during the night, they walk around the spot, before the approach of darkness, with a burning twig of the mondeja bush. They assert that if one has done this, no predatory animal can approach.

789 531 411 224 On the bow end held diagonally upward in shooting, one frequently finds a design like a sentry box, which, in the belief of the people, God himself taught them long ago, and which is supposed to have the effect that in hunting they will kill only fat game.

754 [171] The nature of the sorcery through which sickness and death can be brought about they explain like the Masai. Evil, superterrestrial spirits have nothing to do with it. It is solely the work of evil human beings, who are despised, feared, and therefore expelled; they are called schogoto, in which one recognizes the Masai word ol osokutoni. Persons with the evil eye, who are called gallagumma, are likewise hated and expelled. If one knows no natural cause for an illness or a sudden death, it is regarded as the work of these sorcerers.

000 Law. -- General remarks. -- Property. -- Sharing the hunting booty. -- Things found. -- Barter. -- Debts. -- Liability. -- Gift. -- Blood friendship. -- Murder and manslaughter. -- Negligent homicide. -- Bodily injury. -- Immoral offenses. -- Theft. -- Inquiry about an unknown culprit. -- Legal procedure. -- Swearing. -- Torture. -- Ordeals. -- Bier test. -- Woman before justice. -- Mentally ill.

671 171 The legal views and legal practices of the Asá in general resemble those of the Masai.[1] We find the same leading ideas everywhere. Here, too, might often comes before right, even if not to the same extent as there.

692 [614] [648] There is nothing new to be said about the rights of families and persons. The sole court in litigation is a respected man chosen by both parties, if plaintiff and defendant belong to the same tribe. Litigation or criminal cases in which plaintiff and defendant belong to two different tribes are not settled by the Wandorobo among themselves, but handed over to the Masai of the nearest kraal for settlement. A prosecution of punishable offenses by legal steps is unknown.

1. [For information on legal views of the Masai, see FL12 Masai, 18:Merker, category 116, pp.279-291--Analyst]

423 /260 cont./
The individual person does not have an exclusive right to land or to the use of hunting grounds. Rather, both are common property.
• 224 421 Only one half of any slain game down to the size of a medium antelope belongs to the hunter and his campmates together, while the other half of a male animal is given to the members of his lineage, those of a female one to the relatives of his wife or wives: in both cases: insofar as those entitled to receive it live in the immediate vicinity. Of the two tusks (ligatok, ligasch) of the elephant each
[178] receives half. Recently, the large teeth of the hippopotamus have been shared in the same manner, whereas formerly /261/ they were left lying, along with the bones. For the horns (hadong, hadama) of the rhinoceros the hunter receives in exchange poison or arrow points and then distributes these things among the people who previously were to share the meat of the animal. The hides of the slain game belong to the hunter.

All smaller game belongs entirely to the hunter and his campmates.

421 Property belongs to the single individual, not to the family
425 community. A lost article is returned to the owner, without the finder's claiming a reward. There is no punishment for the appropriation of found articles.

43 There is no general medium of exchange. Money has not yet been adopted anywhere. Goods are always exchanged for goods. For ivory the caravan people pay cattle, goats, sheep, iron wire, beads, fabrics. In the individual barter transaction the Wandorobo never want one kind of goods above, but always several, and of the inanimate ones as many different kinds as possible. The exchange takes place with immediate delivery and is made valid by spitting on the objects. Only exceptionally is a brief delay granted for a
452 small part of the payment. The creditor seeks to have himself paid
426 by a dilatory debtor through self-help, and only if he has no success with that does he make a complaint. It not infrequently happens
[583] that the creditor takes a small daughter of the debtor as security, and a marriageable one as a wife; in the latter instance, he deducts the amount of the debt from the bride price. The debtor's heir is liable,
[672] and, to be sure, for the entire debt. With the debtor's inability to pay, the warrantor is liable, if -- which is seldom the case -- one is present at all. The heir of the warrantor is also liable.

/263 cont./

695 besides the ordeals, the hiss test also prevails as a means of convicting the one accused. In contrast to the Masai, here the innocent one accused receives no compensation.

562 694 695 Women may appear as witnesses before the court, but they are not entitled to make a complaint: rather, their husbands make the complaint for them.

672 934 Here, too, the mentally ill occupy an exceptional position in legal matters, /264/ in that they remain unpunished for offenses that are atoned for by fines. They are not chained, but are allowed to go about freely, and, as long as they are harmless, they are given shelter and food. This is denied to the mentally ill who are dangerous, because of which they quickly perish.

XVI.

000 The story of the discovery of arrow poison. -- Other stories and fables.

538 The stories of the Wandorobbo describe for the most part their own hunting experiences, especially, of course, those of a peculiar nature and with large, dangerous game. It is probably to be taken for granted that in this "hunter's yarns" also run through them.

The Discovery of Arrow Poison

539 252 253 278 411 A poor widow, whom no one wanted to take in and feed, steamed steppe and bush daily, in order to appease her hunger miserably with roots, berries, and tree bark. One day she chewed on a small piece of bark that was distinguished by a very bad taste. Soon afterwards vomiting set in so violently that she was sick for a few days. She thought: "I should probably have died if I had eaten any more of it; since I can not hunt game, perhaps I can kill it with this." When she was well again, she went with her pot to the place in the steppe where in a rocky basin there was water to which the wild animals came to drink. Here, for several days in succession, she boiled the wood of the poison bush and kept pouring the liquid into the little pool. Finally one morning she found ten dead buffalo lying in the

/264 cont./

539 224 278 411 vicinity. She ran to the camp in order to fetch men so that they would carry the meat home. When they saw the dead buffalo, they could not understand how it had been possible to kill so many at once. Then the woman told them how she had done it, and now they praised her as the best and cleverest of women and everyone wanted to marry her. After the woman had showed them how to prepare the poison, they made it themselves and smeared their hunting arrows with it.

Some Stories and Fables

539 An ol dorobosi shot a giraffe, and since it was evening and he was far from camp, he stayed with the animal during the night. He wanted to stay awake because of the predatory animals that were to be expected, but weariness overcame him. In his dream he saw a lion creeping up. He woke up with a cry of fear. Still half asleep, he took his own leg for the lion and hit it with his knife with all his strength. His campmates, who had set out to look for him, found him with a large wound the next day in the steppe and carried him home.

/265/ An ol dorobosi found in the steppe an antelope that he took to be dead. He laid bow and quiver beside the animal and started to skin it. After he had already made two cuts on the belly side, the animal leaped up and ran away with the knife in its body.

A father went hunting every day with his boy. For a long time they were lucky and brought booty home every day. But then there came a time when they did not succeed in killing even a single animal. One day, when they had again walked in vain, they camped far from their hut in the open steppe. In order to warm themselves, they made a fire. Hunger tormented both of them terribly. Then there came to the old man the idea of killing his son and appeasing his hunger with the corpse. He said to the boy: "Go and fetch fire-wood so that the fire will be bigger." The boy did as he was told.

2: Maguire G-5 (ca. 1926) 1927-28
FLÁ Dorobo FLÁ

women and they ours. Now we live with our cattle like the Masai." This account is far from enlightening, and when Serkala states that the *Aramanik* live as Masai, I fancy he is making too sweeping an assertion. Admittedly, the *Aramanik* of Moipo live as Masai, and so do many *Aramanik* in the central areas of Tanganyika Masailand, but I suggest that the Dorobo living at the north end of Lake Eyasi and those on the Serengeti plain (north-west of the Ngorongoro localities), who live a purely bush life, are also *Aramanik*.[1] Lekite was positive in the assertion that all the Dorobo living as such in the northern areas of the Tanganyika Masai Reserve and, furthermore, all the Dorobo in the Kenya Masai Reserve,[2] are *Aramanik*. I have had no opportunity of testing the accuracy of this statement. However, I do not think it likely that there can be yet another type of Dorobo unknown to those individuals from whose information the present notes have been compiled. If my assumption be correct, I think it may well be that *Aramanik* and *Ilaikipa* (the latter possibly under a different name) constitute the bulk of the Dorobo in Kenya, and that the Dorobo inhabitants of the northern areas of the Tanganyika Masai Reserve are almost all *Aramanik*.

The *Aramanik* at Moipo are not fishermen. They do not eat fish, but they are very partial to the meat and fat of the hippopotamus.[3] They do little hunting nowadays and are, both young men and elders, rapidly becoming indistinguishable from the Masai. The *Aramanik* living further north (notably those to the west of the Rift Wall at Sonjan, Sabi and Puldyn) live a bush life of hunting and honey-gathering and are not above shooting a Masai ox when the chance presents itself.[4] They are extremely shy people and I have had little chance of establishing contact with them.

The most remarkable thing about the *Aramanik* is their language. It is guttural in the extreme, and while there would seem to be few of the characteristics of the Masai or *Maiso*

[1] See p. 231, Art. viii. The Dorobo seen by Sir Claud Hollis may, alternatively, have been *Aramanik*.

[2] Almost gone in number.

[3] I have been unable to discover a single individual among the Masai and the Dorobo of all kinds who does not regard the eating of fish as anathema.

[4] According to unconfirmed statements made by certain Masai.

SOURCE: Huntingford, 1929, 1942, 1951, and unpublished material. There are no other sources for the Kipkurerek Dorobo; and except in the case of the Kidoq (p. 70 below) there is no material for a description of any other horde; nor are any other population figures available.

PHYSICAL ENVIRONMENT

The North Tindiret Forest lies about five miles from the south-eastern boundary of the Nandi Land Unit, and rises from 7,000 ft. to over 9,000 ft. It consists of two great east-west ridges reaching an altitude of about 8,500 ft. divided by the deeply sunk river Kipkurere, "hollow (river)," the ridges merging some 12 miles from the western edge in the high ground round Timboroa which rises to over 9,000 ft. The region is dense evergreen "high forest," with trees of 100 ft. and over, and thick, impenetrable undergrowth growing to a height of 6 or 8 ft. The average rainfall on a farm two miles from the edge of the forest was 54.09 ins. over a period of nine years. Till within the last 25 years the Dorobo lived in small isolated settlements right inside the forest. Access was given by two parallel tracks across the south-western corner of the forest, and concealed paths branched off from them leading to the settlements. In addition to providing a permanent home, the forest was their wet-weather hunting ground; in dry weather the Dorobo used to hunt far afield over Nandi and the Uasin Gishu Plateau, and down to the Rift Valley. In 1937 they were removed from the forest, and a number of them (of domicile categories A and B) settled round the edge of the forest, along a narrow strip of grassland and bush that forms the upper edge of the farms which occupy the five-mile space between the forest and the Nandi Land Unit. But the intention of the Government had been to transfer the Dorobo to the Nandi Land Unit. This the Dorobo did not agree to, but their re-settlement along the edge of the forest was not officially accepted, and they lived there without legal rights unless they became squatters or casual labourers on the farms they settled on.

MAIN FEATURES OF ECONOMY

Till disturbed by European settlement, the Dorobo had a purely hunting economy, though during the last 30 years they have been taking some interest in the acquisition of cattle and in small-scale cultivation. In their hunting days, their only livestock were bees and dogs.

HUNTING

The year was divided into two seasons, *emaiswonik*, the dry weather, when they hunted game of all sorts with bow and arrow both in the forest and much farther afield; and *imotet*, the wet weather, when they set traps in the forest. In the past they hunted buffalo and elephant, and lion were killed in the plains; leopard and pig are still hunted. Smaller game hunted and eaten include antelope and monkeys of all kinds: almost any kind of meat was eaten, except that of hyena, jackal, and

[TEXT CONTINUES ON P.58--ANALYST]

1:Huntingford E-4, 5 (1938-1939) 1953 FL6 Dorobo FL6

other scavengers. Nowadays, all hunting activities are carried on illegally with the risk of being punished if caught by the police.

Weapons are the bow and poisoned arrows carried in a quiver. Knives are used to skin game and to make springes. Spears have never been used. The Dorobo used to have hunting dogs, but in the North Tindiret Forest the breed seems to have died out, though it existed in 1927. They have two kinds of trap: (i) The pit trap, *ngurot*, formerly used for buffalo, consisting of a pit 8 ft. long, 3 ft. wide, and 6 ft. deep, with wooden spikes set in the bottom. (ii) The springe or snare, *porousi*, which consists, briefly, of a springy stick bent over, with a noose attached to it connected with a platform: the arrangement is such that when an animal treads on the platform its head enters the noose, and the pressure on the platform releases the springy stick, which flies up, tightening the noose, and holding the animal suspended. Such traps can be made in less than ten minutes. This type is used chiefly to catch antelopes, but leopards have been caught in them. Cross-bar traps with a drop-spear were not used by the Kipkurerek Dorobo.

The only hunting taboo recorded is that the night before he goes out hunting a man must abstain from sexual intercourse. This does not apply to the setting of traps.

As regards land rights, the forest was divided into districts, *koret*, pl. *korosuek*, and in his district each man had an hereditary block of land in which he hunted, set traps, kept his honey-barrels, and collected wild food. Occupation rights were recognized by public opinion, and trespass on a man's forest area, i.e., deliberate entry in order to start hunting without permission or the promise of a piece of meat, might result in the trespasser's death at the hands of the owner, who would then have to pay compensation for homicide. Theft of game from a trap is said never to have occurred, not only because the thief might be killed, but because his belly would swell to a great size and he would die after eating meat stolen from a trap.

Bees

Honey is to the Dorobo what milk is to the Nandi: it is "sacred," and its supply must be protected by the observance of taboos. Fruit and blood must not be eaten on the same day as honey (though meat may be eaten); when a comb is emptied, it must be carefully hidden in the undergrowth; and after eating honey a Dorobo cleans his hands in earth, not (like the Nandi) by wiping them with leaves.

The Dorobo recognize four varieties of bee: *sekemik*, the honey-producing kind; *imeiik*, solitary bees which live in trees; *kosomek*, earth bees, which live in the ground; and *kiptulonik*, mason bees, which live in cells made of earth and particles of stone cemented together by their own saliva. The Dorobo divide the honey-bees, *sekemik*, into three kinds: the queen, *kamat ap sekemik*, "the mother of the bees"; the workers, called simply *sekemik*, considered to be males, which make honey by eating the "sap" (*pek*) of flowers and then vomiting it into the empty honey-combs; and the drones, *kapurenik*, considered to be idle females which do nothing useful.

Hives or honey-barrels (*pasanet*) are made either of slats of wood tied together, with circular wooden end-pieces; or of the two halves of a piece of log split longitudinally and tied together. They are set in trees, and when a new hive is put up, the owner calls the bees, in a high-pitched tone, to come and occupy it: "Bees, bees, from all the country, come here now, and pour in honey, pour in honey." Bees are said to recognize their owners by their body-smell, and do not sting them when taking honey. Certainly taking honey does not appear to be a painful or dangerous process to the Dorobo owner. Theft of honey from a barrel is considered very low, and a man might kill a thief, though he would have to pay compensation for homicide.

Honey is an important article in Dorobo economy: it is eaten as food, made into an intoxicant, used for ritual purification, and it forms an article of commerce.

1;Huntingford E-4, 5 (1938-1939) 1953 FL6 Dorobo FL6

tree," *rotinwet* (*bigelia æthiopica*); and *maiyek*, eleusine beer, made, though seldom, in the Nandi way. They also drink a mixture of honey and water called *lohomek*.

Trade and Exchange

The inability of the Dorobo to produce many of the things they need has led to the development of a system of exchange with the Nandi, who till recently were almost the only people with whom they had dealings. Relations between Dorobo and Nandi have been such that, though maintaining their complete independence, the Dorobo have not only obtained goods by trade, but have acquired and assimilated much Nandi culture, including language, clan-names, agriculture, and many material features like dress and ornaments. Their relations are in general friendly, for the Nandi like honey and furs which they get most easily from the Dorobo, and there has been an increasing number of marriages of Dorobo men with Nandi women, as well as of Dorobo women with Nandi men. But neither side takes liberties with the other: the Dorobo fear the physical superiority of the Nandi, and the Nandi fear the close-to-nature life of the Dorobo, as well as a certain mystical force as rain-makers which they attribute to them.

From the Nandi the Dorobo get objects of iron, pottery, beads, tobacco, cattle (see below, p. 61), and the seed of cereals for planting. The Nandi get skins and honey from the Dorobo. There are no special places for trade, but the Dorobo go to the nearest smith or potter or other person who can supply them, and make their bargains. This means a journey into the Nandi Land Unit, but other things can be got from the nearest friendly Nandi. The exchange values in 1939 were:

1 axe for 1 bagful of honey;
1 bundle of tobacco (about 1 lb.) for 1 bagful of honey;
1 arrowhead for 1 gourd full of honey;
1s. worth of trade beads for a gourd full of honey;
1 knife for a day's weeding in the smith's garden;
1 large earthenware pot for 1 large prepared buck skin (usually bush-buck)
1 small earthenware pot for 1 small prepared buck skin (usually duiker);
2 baskets of seed for planting for 1 new basket.

The bag, *motoket*, is made of skin and measures about 8 ins. by 7 ins.; the gourd is about 10 ins. long; the large pot is about 20 ins. high, the small pot about 10 ins. high; and the basket is about 6 ins. deep and 6 ins. wide.

Cattle

The Dorobo interest in cattle is probably due to their long contact with the Nandi; but though they desire cattle, they have not the land for them. Yet they have speculated about cattle inheritance, and by 1939 had worked out theoretical rules which they had scarcely had opportunities of testing. When they were evicted from the forest in 1937 they were officially credited with about 2,000 head of cattle; but no census of either people or stock appears to have been made in preparation for this event, and most of these cattle did not belong to real Dorobo. In 1938-9 the numbers of stock which I counted during the compilation of my census were:

	Cattle	Goats	Dogs
Koret of Kipkorom ..	25	15	4
Koret of Sosoiyo ..	54	19	3
Koret of Kelpui	11	0	0
	90	34	7

Methods of cattle-management are based on those of the Nandi.

1: Huntingford E-4, 5 (1938-1939) 1953 FL6 Dorobo FL6

Means by which the Dorobo can acquire stock are: (1) By bridewealth: when a Nandi marries a Dorobo girl, her father gets the normal Nandi payment of one cow, one ox, and a varying number of goats. (When a Dorobo man marries a Nandi girl he has to find somehow the same amount of cattle.) (2) By gift exchange: a Nandi makes friends with a Dorobo, mainly to get honey, and after the first step towards friendship has been taken, the Dorobo gives him some. Later the Nandi gives a goat, and the way is thus paved for the exchange of cattle. This exchange is independent of the honey, which is given by the Dorobo from time to time. This process of acquiring cattle is of course a form of payment, but it is purchase under the peculiar conditions of forming a friendship by a previous exchange of gifts, for the Nandi do not readily part with their cattle, and it is necessary to lead up to the final stage by a preparatory exchange of other things. So far the Nandi have been willing to exchange male stock only in this way; to get cows the Dorobo have had to rely on bridewealth. (3) The Nandi will sell goats for cash, but not (at least up to 1939) cattle. The Dorobo do not seem to want sheep; they had none in 1939, nor when I first knew them in 1927.

Inheritance

The general rule is that when a man dies, his goods are kept by his wife for handing over to his children if they are small, or they pass straight to them if grown up. When a man has neither wife nor children, his heirs are his brothers, his father's brothers' sons, or his mother's brothers' sons. Women do not inherit stock. Land rights in the forest pass to the eldest son, or to a brother, or to one of the relatives termed *macokor* (see below, p. 62). Weapons are left to a brother, to a *macokor*, or to a clansman. Dogs are left to sons, or else to a brother or *macokor*. Goats are divided proportionately between sons, or pass to a brother or *macokor*. The proportion is roughly as follows, assuming that a man left seven goats and three sons: to eldest son, three; to second son, two; to youngest son, one; to his wife, one, this and its offspring going eventually to the youngest son. The theoretical division of cattle is approximately thus: to eldest son, two; to other sons, one each; to wife, one, which reverts to the youngest son.

Division of Labour

Everything connected with hunting, bees, and weapons is done by men; domestic work by women. The main occupations are divided thus:

Men:	Women:
Making fire.	Building houses.
Hunting.	Collecting vegetable food.
Trapping.	Getting water and firewood.
Putting meat on to cook.	Looking after meat cooking.
Making honey-barrels.	Cooking other food.
Collecting honey.	Milking when there are cows.
Making weapons.	Making baskets.
Trading with the Nandi.	Preparing skins.
Getting coloured earth.	Making clothes, etc.
Cutting wood.	Care of the children.
Making fences.	Sweeping huts.
Preliminary heavy work in the *imbaret*.	Cultivation, all stages.

Children of both sexes help in weeding and herding stock; girls help with the housework and milking, though boys are allowed to milk till they are circumcised. This division is followed strictly with regard to the first nine male activities; but with the last three there is some overlapping; and the essential domestic work and cultivation are often done by men, especially when they are unmarried or live quite alone.

2: Maguire G-5 (ca. 1926) 1927-28
FL6 Dorobo FL6 .

possibly these Dorobo had been poor Masai, who, having lost their cattle, had taken to hunting, is probably the correct one. It would appear likely that the Dorobo in question were *Balaŋga*, though Sir Claud was unable to satisfy himself as to their true origin.

The original *Balaŋga* are stated to have come from the Kisongo [1] district of the Masai. It may be that this is the case, as the name Kisongo originally stood for a very large tract of country—in fact, almost the whole area occupied to-day by the Masai of Tanganyika Territory. It is certain that there now are *Balaŋga* Dorobo with the Masai throughout the length and breadth of the Tanganyika Masai Reserve, and it becomes more difficult daily to find *Balaŋga* who still devote themselves to hunting. Even those who own little or no stock prefer to live with their richer brethren or with the Masai. The younger men have never led a bush life. They carry spears [2] (and, when appropriate, shields) and do not care to be reminded of the fact that they were ever other than the Masai.

Occasionally, when an elephant or other large beast is killed by the European sportsman, a few old men (Masai, to all outward seeming) will make their appearance unobtrusively, generally accompanied by donkeys. Having obtained permission, they will proceed to rip and hack away huge quantities of the flesh with a determination and cheerful abandon seldom to be met with in the Masai. When the donkeys have been loaded with as much meat as they can carry, the old gentlemen will quietly depart, bound, presumably, for a banquet of Gargantuan proportions. Should one ask, they will admit shyly that they are *Balaŋga*, but will almost always add: "We are now Masai again."

I think there can be no doubt that the Masai and the *Balaŋga* are one and the same. The opinions of the Masai (notoriously unwilling to admit the equality of others) and the *Balaŋga* themselves are unanimous on the matter, and I have been unable to discover any shred of evidence to the contrary. It would appear reasonable to assume that the *Balaŋga* are the

[1] Cf. Hollis: *Masai Language and Folklore*; pp. 260, 261. The name would seem to be restricted, nowadays, to an area south-west and west of Arusha. (Map reference: B 5; Kilimanjaro: E, F, I, K.)

[2] The spear would not seem to be an indigenous Dorobo weapon.

2; Maguire G-5 (ca. 1926) 1927-28
FL6 Dorobo FL6

descendants of the hardier members of the Masai tribe, who were forced to adopt a life of hunting when supplies were short, as on the occasions when rinderpest swept through the Masai herds, leaving famine in its wake.

The changes from the original stock wrought by environment alone in many Western races are more marked than the differences to be observed between the *Balañga* and their parent tribe. It may be said, in the case of the *Balañga*, that environment would seem to have done its work with remarkable swiftness if any outward difference can be detected between the *Balañga* and the Masai to-day, but is not Africa a country of mushroom growths?

Il-Kinyalañgat

The *Kinyalañgat* Dorobo would seem to be to the Kwavi or Lumbwa [1] Masai what the *Balañga* is to the Masai proper. The Lumbwa, with the *Kinyalañgat*, live on the southern border of the Tanganyika Masai Reserve and in various small communities throughout the Dodoma, Kilosa and Handeni Districts. There are, also, Lumbwa in Usambara, east of the Pangani river. The Lumbwa state that the *Kinyalañgat* Dorobo originated in or near Morogoro, but as many *Kinyalañgat* are found wherever the Lumbwa live, I do not think this assertion can be relied on except insomuch as it refers to the *Kinyalañgat* who sprang from that section of the Lumbwa which itself "originated" in Morogoro.

I have listened to the speech of the *Kinyalañgat* (who have no language but Masai),[2] and in it can be detected the typical characteristics which distinguish the pronunciation of the Lumbwa from that of the Masai proper. The *Kinyalañgat* call themselves Lumbwa,[3] live with the Lumbwa and move when they move. They have, as a general rule, small herds of

[1] *'l-Oikop*. The Lumbwa and the Masai proper are not friendly. Any account of their differences would be too lengthy to insert here, as the original cause of discord is of some antiquity. There were some small skirmishes between the Lumbwa and the Masai of adjoining areas during the late war. The Lumbwa are said to have assisted the Germans on many occasions to locate hidden Masai cattle.

[2] See note 3, p. 131.

[3] Kwavi, rather, as the name "Lumbwa" is not in favour among the Kwavi, being a term of contempt applied to those who, pastoralists born, have adopted agricultural habits.

2: Maguire G-5 (ca. 1926) 1927-28
FL6 Dorobo FL6

cattle. In many cases the "herd" of a *Kinyalañgat* elder may total only three or four head, but a few of them are better off.

The *Kinyalañgat* are now almost indistinguishable from the Lumbwa, and are agreed by all to be merely impoverished Lumbwa, who took to a bush life for the same reasons and probably about the same time as the *Balañga*. They are good bushmen even to the present day, but are not born to the bush life and will not live in the bush of choice. A *Kinyalañgat* elder of the 'L-aimer age[1] named Mwanamsunde lives at Mtambalo on the Handeni-Masai border. He is one of the oldest men in Masailand, but has little or no influence though he is termed *Ol-aigwenani*[2] by courtesy. He speaks no language except Masai with a marked Kwavi intonation.

I have not written much about either the *Balañga* or the *Kinyalañgat*, as I am convinced that the former are Masai and the latter 'l-Oikop. If this is not the case, I am unable to put forward an alternative theory, as my inquiries have been diligent and I have been forced to the conclusion above stated. It may be argued, therefore, that the *Balañga* and the *Kinyalañgat* are not Dorobo in the true sense of the word. In this I agree, if it be postulated that the Dorobo is a man apart and not of Masai origin. It seems to me very likely that the *Balañga* and their Kwavi contemporaries followed, through force of circumstances, the only mode of life which promised to keep them from starvation. In following this bush life they had before them the example of the people with whom it is now proposed to deal, and who have a much greater claim to be called Dorobo.

Il-Mósiro; Il-Médiak; Il-Kisankasa

The three names given above would seem to denote one and the same type of Dorobo. I have been unable to discover any difference between them. Curiously enough, although I have met many *Mósiro* and *Médiak* I have, so far, failed to come across an individual calling himself *Kisankasa*. I am inclined to think that the name is merely an alternative for one or both of the others. It is possible that these names may denote

[1] Circumcision of 1874 approximately, according to Hollis.
[2] Spokesman or Counsellor.

2: Maguire G-5 (ca. 1926) 1927-28
FL6 Dorobo FL6

clans or families,[1] after the manner of the Masai, but there is no difference between their several bearers at the present time. *Mósiro* and *Médiak* Dorobo live and hunt together all over the southern half of the Masai Reserve to-day. They are fairly numerous[2] (for Dorobo), and in many cases are almost indistinguishable, outwardly, from the Masai.

There, however, the similarity ends, as these Dorobo (referred to, henceforward, as *Mósiro* collectively) are the first with whom we have had to deal possessing a language of their own. Reference to the comparative lists of numbers and the list of names of common objects given elsewhere will show the wide difference there is between the language spoken by these people and that of the Masai.

According to Lekite, who was the only man in recent years holding even a semblance of authority among these people, the "home" of the *Mósiro* is at Talamai.[3] He, in common with many Masai and Dorobo elders, admits that the Dorobo originally came from a country designated vaguely as *Juu*,[4] but no living *Mósiroi* can remember the time when the majority of his people did not live at or near to Talamai.

The *Mósiro* are to be found, occasionally, living with the Masai in the kraals of the latter. They are sometimes (particularly when game and honey are scarce) to be found in small rude kraals of their own, close to the Masai. In these kraals will sometimes be seen a few goats or sheep and almost always fowls.[5] More often, however, the *Mósiro* live in tiny communities (sometimes a man, his wife and their children alone) in the depths of the bush. There they exist, houseless save for a rude shelter of skins within a primitive thorn stockade, by hunting and gathering roots and honey. When supplies run short they beg from the Masai. When a large animal is shot or dies from natural causes the *Mósiro* in the vicinity seem to become aware of the event in the most uncanny way. They will appear unexpectedly, make their camp, and remain until the carcass has been completely denuded of flesh. The meat is not eaten quite raw, but is subjected to a hasty charring, the

[1] More probably the former.
[2] Possibly 1000 souls, including the women and children.
[3] See note 3, p. 127. [4] *Above:* in this case meaning the north.
[5] The Masai regard the eating of fowls or eggs as unclean.

2: Maguire G-5 (ca. 1926) 1927-28
FL6 Dorobo FL6

duration of which is in inverse ratio to its toothsomeness and the severity of the cook's hunger.

The Masai are good to the *Mósiro* and seldom refuse them a share in whatever food is obtainable—be it milk, meat or grain. The *Mósiro* expect this; in fact, many of them seem to look on free rations from the Masai as their right. The reason for this is stated to be that the *Mósiro* helped the Masai on many occasions in the past (particularly during the great rinderpest epidemic in the early 'nineties) by hunting for them when starvation had overcome the ingrained antipathy of the Masai to venison. In addition, before the coming of European rule many elephants were killed by the *Mósiro* at the request of the Masai. Lekite told me of one drive in which he and about thirty *Mósiro* were engaged during which sixteen elephants were killed.

When a *Mósiroi* obtained cattle he used, unless restrained by his more prudent friends, to slaughter and eat them in the shortest possible time. Up to quite recently, a beast was valued by the *Mósiroi* only for the amount of meat it was capable of providing, but nowadays a few of them are beginning to herd cattle in a small way and some even live as Masai. It is interesting to note that many of the older generation, particularly the women, profess an aversion to having cattle in the vicinity of their own dwelling- or sleeping-places.

A few *Mósiro* till the land, but in a half-hearted way. They are extremely improvident and prefer to risk almost inevitable famine rather than to exert themselves in cultivating grain. They never expect their women to work in such small plantations as they may have. A *Mósiroi* will cheerfully tramp the bush for a week or more, picking up a most precarious existence on tubers and roots, and will consider himself well repaid if he returns with a few pounds of honey. He will be horrified at the idea of putting in one hour's work each day on a mealie patch for the same length of time.

In the bush, very little in the way of food comes amiss to the *Mósiroi*. Failing meat, his favourite food is honey, but this is regarded as a delicacy and would be eaten wholesale only under the most exceptional circumstances. If meat and honey are unobtainable, the *Mósiroi* has at his command an extensive

2: Maguire G-5 (ca. 1926) 1927-28
FL6 Dorobo FL6

be that their absence is in many cases due to poverty. The *Mósiro* women follow the unusual custom of the Masai women in shaving their heads.

The younger generation of the men ape the Masai in wearing pigtails and dress like them when they can. They are addicted to the use of *Ol-kária* [1] and will, in time, be absorbed by the Masai. A few of them are now working as herds for various Masai, and, as I have said before, others have begun to follow a pastoral life with their own small herds.

All the *Mósiro* speak Masai, but many of them do so very imperfectly. No Masai that I have met can speak the *Mósiro* tongue, though Masai who have come in contact with the Nandi tell me that the language spoken by the *Mósiro* to-day seems vaguely reminiscent of the Nandi speech. Reference to the lists of numbers given elsewhere will show the marked similarity there is between the numerals (up to five) in the Nandi, Suk and *Mósiro* tongues.

The language of the *Mósiro* is dying, as any language except Masai tends to do in the Masai country. I have asked many *Mósiro* to give me the names of various common objects, and I have often been given a Masai name, my informant protesting that he knew no other. In the case of the numerals, it would seem to be a moot point as to whether the *Mósiro* tongue originally possessed numerals up to seven only and borrowed the remainder from Masai, when usage demanded, or whether the numerals from eight onwards have fallen into disuse and have been replaced gradually by the Masai words.

The physical make-up of the *Mósiro* is good. They are, as a rule, tall and lithe and are in many cases more muscular than the Masai. The pigmentation of their skins varies from a light, clear brown to a black almost Nubian. There would seem to be differences between them and the Masai in the formation of the jaw-bone and the zygomatic arch. I have had neither instruments nor training to enable me to undertake a series of anthropometrical measurements, but I think it is safe to say that many *Mósiro* have high cheek-bones and

[1] A mixture of red ochre and mutton fat, smeared all over the body and patterned on the legs, arms and face. It seems to be in use among nearly all Nilotic tribes.

3:Huntingford E-5 (1921-1928)1929 FL6 Dorobo FL6

Hunting.

224 The chief occupation and, in fact, till the last few years, the only occupation of the Dorōbo, is hunting (*sagus*: Kony, *kip-sagus-iax* = hunter). They say that at the present day they do not hunt as much as they used to. All kinds of animals were the objects of the chase; the buffalo (*kiptarordt*; N. *soiet*), rhinoceros (*kip-kumit*), leopard (*melilto*, N.), lion (*sombit*; *ãgetuindo* N.,) giant pig (*tumda*, N.) were among the bigger game hunted. Various kinds of monkeys and antelopes are also sought after, both for their skins and their meat. (*See* "Food" for a list of the animals eaten by the Dorōbo.)

[411] The weapons used in the chase are the bow (*kuyuãgda*, N.) and arrow (*kōtiek*, N; *mbunatit*, etc.), and spears (*olmorondoit*†). Arrows and spears for hunting are [208] poisoned with a concoction made from the keliot tree (N.).[1] Formerly, before the elephant disappeared from the Tindiret region it was hunted and killed with poisoned spears. Small game, besides being shot, are also caught in traps and snares, of which the Dorōbo have two kinds; buffalo are also caught in the first kind: (1) Pits (*nguret*), covered with thin sticks and leaves, with spikes (*kipwaiyeinat*) set in the bottom. (2) Snares (*porōnet*; N. *mestet*) (Text-fig. 25), which are constructed as follows: a springy stick, A, is stuck in the ground and bent over; to its upper end is fastened a piece of tree-rope, B, which is loosely attached to a hooped stick stuck in the ground, supported by three short upright sticks; a little lower down the bent stick A is fastened a noose made from the ndorokyat tree, which is held in place by a cleft stick stuck in the ground on each side; under the noose is made a little platform of sticks, which is covered with leaves. When this platform is touched, since it is in contact with the stick holding the rope B, it releases the rope, and the stick A flies up, thereby tightening the noose.

[231] Dogs (*ãgōkto*, pl. *ãgōkik*) are used in hunting, and are the only animals kept by the Dorōbo who live in the forest. When in the forest they wear leather collars, to which are attached, under the throat, a small bell. The dogs seem to be of a different breed to the ordinary thin-nosed cur so common in native reserves, and they are kept in better condition. Their excrement round the huts takes the place of cow-dung in the neighbourhood of a Nandi hut, and makes the air unpleasant.

A description of the weapons is given on p. 346 below.

Food.

862 The staple foods of the Dorōbo are honey (*kuniat*, N.) and meat (*punyek*, N.).
136 For meat they kill the following animals:—

Antelopes.

Kipkeseket (N. *kimerenget*,).—Blue duiker (*Cephalophus aequatorialis*).
Mindet (N.).—Red duiker (*C. ignæ-issaci*).

[1] *Acocanthera Schimperi.*

prepare food and wait upon the men, themselves eating when the men have finished. At the present day the Dorôbo are taking to eating eleusine grain, which is crushed on grindstones (*liêto*, N.) and made into a sort of porridge; and milk, which they obtain from Nandi, if there are any near them. Beer is made from honey, and is called *kipketînik* (N.). Tobacco (*tumatet*, N.; or *chepkochêtit*,[1] N.) is bought from the Nandi, and is taken by men, and occasionally by women. It is either chewed (*mit*, N.) or smoked in Kavirondo pipes (*terênik-aptumatet*, or *kwesînik*, N.), which are also obtained from the Nandi. The men carry tobacco in cylindrical boxes called *kiprauwit* (N. *kiprau*) (Text-fig. 22), made from sosoiyat (bamboo), with skin coverings for the ends, to which are attached thin leather thongs, by which the box is slung round the neck.[2]

Agriculture and Stock.

Formerly the Dorôbo possessed no stock, nor did they till the ground. During the last quarter of a century or so a few of those living on the edge of the forest have taken to cultivating small plantations (*imbaret*, N.), in which they grow eleusine grain (*olbaiek*†, or *paiek*; N. *pâk*) only. A few possess, at the present day, one or two cows; others have a few goats and sheep; no one has more than 5 to 10 head. The only animals they possess in numbers are dogs.

Dress and Ornaments.

(i) *Males.*—Boys wear skins of antelopes and monkeys (*akuriet*; N. *inguriet*). Warriors wear skin garments of duiker (*ngeswuyo*,[3] N.) called akuriet; they wear leg-bells attached to a leather band (*mpitiko*,[3] pl. *mpitikochîsiek*) on the ankles. Nowadays some wear pieces of cotton-cloth (*enget*, N.) dyed brown.[3] Old men wear bush-buck skins (*akuriet*) with the fur left on. Caps (*engeruit*†) are worn, of blue duiker skin with the fur left on, by old men, and of cotton-cloth by warriors. Belts (*entoreit*†) of leather are worn by old men, and of beads by boys and warriors. Necklaces of chains (*sirimdo*, N.) or iron-wire (*asingait*, N.) are worn; also various kinds of iron ear-rings (*olaimeriat*† and *kimeitaiit* (Text-figs. 13–17); N. *kimeitritiat*) are worn by warriors and elders.

(ii) *Females.*—The dress of the women and girls is very similar to that of Nandi women. They wear skirts (*chepkaiyuit*; N. *chepkwit*) and upper garments (*koliket*, N.), both of tanned leather, with the fur removed, in the same manner as the Nandi women. Their ornaments consist of iron-wire armlets and leglets (*makirurênik* and *kurik*, N.), and wire necklaces (*asingait*, pl. *asingutsiek*, N.). Married women wear

[1] *Chepkochêtit* means "snuff" in Nandi.

[2] These are similar to the Nandi tobacco-boxes, from which indeed they are probably borrowed.

[3] As do the Nandi, from whom doubtless the custom spread to the Dorôbo.

4:Huntingford E-5 (1938-1939) 1951 FL6 Dorobo FL6

gaining his position through the tacit recognition of the people. The horde therefore consists of a loosely integrated group of districts held together partly because they "are all Dorobo", but much more by the clan-solidarity which extends across the district boundaries. The clan is thus a far more important institution than it is among the Nandi.

The Dorobo are a hunting people who have been forced to take up agriculture, and at the same time are in process of acquiring a small amount of live stock. A great deal of their culture and most of their language have been borrowed from the Nandi; but their habits and mental characteristics are their own, including a "hunting outlook" which contrasts with the "cattle outlook" of the pastoralist, and a feeling of sympathy with wild animals that does not exist among either pastoralists or agriculturalists. Next in importance to hunting come bees, and honey is regarded much as pastoral people regard milk.

Although the Dorobo are commonly thought of as a people who wander at will wherever there is game, this notion is true only to a limited extent. Parties used to go far afield in the old days seeking game outside their own territory in the sparsely inhabited areas of the highlands; but their own forest was and still is divided into strictly observed economic areas where are family holdings in which people hunt, set traps, keep their bees, and collect vegetable food. These areas may look small on the map; but anyone who thinks that half an inch on a map (representing perhaps one mile on the ground) seems a very short distance, will find when he gets to the forest that one mile on the ground is a very formidable tract offering all sorts of possibilities for the hunter, and infinite chances for the stranger to lose himself.

888 helps his wife to bring up his children, continuing her claim on him in affection which outlasts childhood into old age.

596 My chief friend and informant among the Dorobo, Kimopo arap Mining, lived, during the period of my field-work, at Kipukua, with his mother Cesikirikat, and his family consisted of the following:

Cesikirikat ♀

♂ Arap Mining = Cepkumuren ♀

♂ Kiprotic ♂ Kiptuma ♂ Tiongoi Situni ♀ girl not yet named, born 3 Dec 1938.

[342] In July 1938 he was living in a flat-topped hut in the middle of his section of the settlement; but by December of the same year he had moved [361] to a new hut with a pointed roof outside the *shamba*. His mother's hut was about 300 yards away at the other end of the *shamba*. His three boys (all *Juma* age-set, he himself being a *N'yongi*) ranged from about four years old upwards, and Situni, the elder girl, was about seven. At this time he [513] slept in the back part of the hut, the *incor*, where his goats are kept at night, and his wife slept with the children in the front part, the *koima*. This [231] was because she was suckling a baby. Strictly, Arap Mining should have gone to sleep in another hut, but since this was not possible for several reasons, the wall dividing the *incor* from the *koima* was allowed to make the *incor* count as a separate hut (the original type of Dorobo hut has no partition at all).

855 One day I arrived rather early and found that Cepkumuren had gone across the valley to get a new water-pot, leaving Arap Mining in charge of the children. Situni looked after the baby, but still he found his responsibilities rather a heavy burden, and was glad when his wife returned a little before noon. Cepkumuren fed the baby, sent the children indoors to rest, and went down to the river to wash. At this hour, when there is no particular work to be done, the older people sleep. On some days Cesikirikat comes to Arap Mining's *shamba* to help with the cultivation: Cepkumuren [241] normally works there too, but not every day while the baby is so young. When she does go, Arap Mining goes with her, and the baby is left with Situni. But the *shamba* is not so far away that Cepkumuren cannot hear the children if anything goes wrong.

855 604 The Dorobo elementary family might thus seem to be independent and self-contained. But it is not so really, and other relatives have a share in the upbringing of the children, not in spite of the parents' authority, but in support of it, and the relative who must be considered next to the parents from the Dorobo point of view is the father's brother, *papa*, who often lives in the same settlement, or if not, only a short distance away. This person, especially when he is an elder brother, has a position of authority over his brother's children at least equal to that of their father. His wife, a classi-

5:Huntingford E-5 (1938-1939) 1954 FLA Dorobo FLA

the forces of nature, a belief which (I am convinced) does have the effect of giving him confidence in his ability to deal with an imperfectly understood world. All those parts of human life in which there is an element of uncertainty or danger can be "controlled" by means of magic, not always completely, but with enough coincidental result to confirm the belief that what has been done is the right thing to do and to keep on doing.

The main occupation of the Dorobo was hunting. Unfortunately this is one of the things we know least about, because owing to external pressure the Dorobo have had to give up real hunting and now confine themselves to trapping. It was therefore impossible to get hold of anything more than a few allusions to the hunting magic of the old days. On the one hand, fear of the government has undoubtedly sealed the lips of some of the older Dorobo, for hunting is now forbidden, and they were afraid, quite mistakenly, that if they talked about it, they might get into trouble, as people might think they were still hunting; and on the other hand, ignorance prevents the younger men from talking about it, for most of them have never hunted in the real sense of the word. But there was hunting magic. There was, for example, not only a seasonal division of hunting activities, but a magical division as well. In the dry weather people used to hunt for eland with bow and arrow; in the wet weather they set traps close to home. Now from the magical point of view it is the bow and arrow work that needs help, for in it there is an element of danger to the hunter, and of uncertainty as to whether he will make a kill. In trapping, the process is mechanical, a mere matter of being able to make a trap. All that need be done is to set the trap and wait: sooner or later it will catch something without any danger to the trapper. So when a man was going out with bow and arrow he had to abstain from sexual intercourse immediately before setting out on an expedition, lest the act should put him into mystical danger. Prayers and the observation of omens before going out gave a man further confidence. But when setting traps this abstinence is not necessary.

We have already come across a good deal of magic. The forms of purification after killing people, for instance, are magical as much as religious; so is the cleansing of women after childbirth; and all sorts of things people do in daily life are nothing else but manifestations of the belief in the efficacy of magic. When a man puts a new honey-barrel into a tree and calls out to the bees to enter it, his call is as much a magical utterance as a mere invitation to enter his barrel.

Omens include the following:

If the birds called *kipsiliti* and *kipkuekue* or *kipkuekue* (both species of woodpecker) are seen or heard on the right hand side when starting out to hunt or on a journey, a man will be successful; but if they are on the left, he will be unsuccessful.

If a snake crosses the path from right to left, having first been seen lying still on the side of the path, it is a bad sign, and a man should return home and wait till the next day. But a snake which is seen in the act of crossing a path is of no significance, "for it also is travelling".

Hollingsfield E-5 (1936-1939) 1994 FLA Dembo FLA

different, for they also are intelligent. Every animal of the forest is alike*; we eat some, others we do not; but we like them all. We are of the forest, and they also are of the forest.)

Wild animals for the Dombo have personality, not the kind that is expressed in the folk-tales of pastoral and agricultural Africans in which animals speak and behave like humans, but a real kind of personality that human beings like the Dombo can respond to.

Bees, though not themselves reared, are analogous to cattle among the Nandi, and their product has great social value and hence strong ritual value. Besides giving honey with its many uses, bees provide an occupation which is less strenuous than hunting and can thus be continued by older men who are still reasonably active but not active enough to stand all the rigours of a hunter's life.

Edible plants have social value, but since under existing conditions there is no scarcity of them, there is no ritual relationship between them and men.

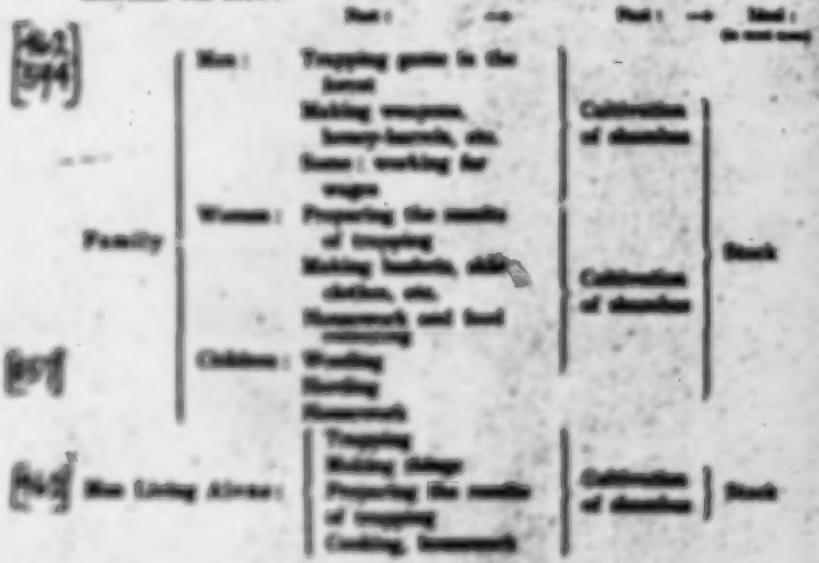
The clan has a social value not found among the Nandi, for the Dombo are not a tribe in the same sense that the Nandi are, and although the significance that the similar expression *ke Nandi*, "we are Nandi", gives when said by a Nandi. The real unit of the Dombo is the clan, the significance and solidarity of which we have already tried to explain; and the effect of all that the clan means to the Dombo is that it has an immense group-value, being the element that ensures inside solidarity.

Personification and well-being. Rain and its inevitable concomitant the thunder are perhaps more striking to a forest than the sun, and it is reasonable that they should be personified in one figure: "*Ilat* was a man". This is probably an original Dombo belief, for to the Nandi *Ilat* has the form of a bird. This personification expresses and fulfills the Dombo need of personal contact with a dangerous element, and explains the actions of the Dombo whom the Cleric Hezza saw defying the "rain-god" *. The notion of *Asis* is much less concrete and definite, and in spite of occasional prayers to him, the conception of his functions is even less clear. Yet while *Ilat* may be regarded as the power which controls the weather, *Asis* seems to be the moving spirit behind everything, with the spirits of the dead as intermediaries between man and 'nature'. It is plain, however, that the well-being of the herds is maintained by keeping on the right side of these powers, and that the avoidance of public debts is necessary to prevent disaster to the herds. Public debts thus in one sense come under the head of religion, for their commission entails the breaking of the ritual relationship between man and

* That is, although some animals (like human kind or Dombo) are more intelligent than others, and although the human kind are some of the others that are all, nevertheless they are all alike, human and non-human, in that they all live side by side in the forest.

* Hist. 1900, 100.

433 the absence of pastoral and agricultural techniques and vocabulary, by their myths, and in fact by everything about them. To-day it is true that they are becoming agriculturists, as the following analysis of their economic activities will show:



Dundee life therefore converges on subsistence, with a hunting background, and seems to view as the ultimate achievement. For though the hunting instinct is still very much alive, and though a great deal of time is now spent on cultivation, there is no doubt that the Dundee (in 1939 at least) had a Dreamtime economy in their minds as the ultimate goal.

5. Economic Activities

a) Beekeeping

434 Honey is to the Dundee what milk is to the Hindu. It is much-sought food has a high ritual value, in consequence of which certain rules must be observed lest the supply fail. A person must not eat fruit or blood on the same day that he has eaten honey, though he or she may eat meat. After eating honey, bits of the comb must not be left lying on the ground, but must be hidden in the undergrowth. Amos Mbote said, somewhat unconvincingly, that the reason for this was "that other people shall not see them and so be led to your honey-barrel". But this is probably not the true reason, which may be either simply respect to the honey, from a fear that if treated disrespectfully the supply will fail; or else fear of a witch putting a spell on the bees or honey

4:Huntingford E-1 (1938-/939) 1953 FLA Dorobo FLA

[125] described as *ceremonomet*, i.e. narrow-waisted; she is bigger than the others, with a large head and body and no sting. The workers, called simply *sekowik*, "bees", are considered to be males[*], and the Dorobo say that all the male bees in a swarm fertilize the queen. The queen lives inside the swarm surrounded by the bees, and never goes outside it, being fed by the workers with the honey they make, and she lays her eggs in the fresh combs before any honey has been deposited in them. The workers make honey, according to the Dorobo, by eating the 'water' (*pak*) of the flowers, which they vomit into the empty combs when they return to the swarm[*]. A comb is made (*ar built, ne sepeiat* — build the comb) by the mouths of the bees with the help of another substance which they get also from flowers; and from the same source they get wax (*pomoriat*) which they bring in on their feet, and use to close-up openings in the hive[*]. This is what the Dorobo say. The drone, on the other hand is considered to be a female wiggli does no work and has no sting. The drones just fly about "playing", and as far as the Dorobo can see perform no useful work. They just eat up the honey and often a time the workers kill them, *kotil kibit*, "they cut their necks", so that they shall not eat the whole supply of honey[*]. Terms used to describe bees are:

Kamat — queen (lit. mother).
Sekowik — workers (sing. *sekweiat*).
Kajuruwik — drones (sing. *kajuriat*).
Uwek — young bees, grubs (sing. *uweuet*).
Gidoiyat — swarm.
Mpakiat
Wawuriat — Empty comb, either new and unused, or old.
Kipiririat — comb full of honey.

The Dorobo seem to have no idea of the length of a bee's life, which in Europe may amount to some seven months in the case of bees born to the autumn.

●231 [422] [428] Honey-barrels or hives, *pimwet*, are made of slats or of hollowed-out logs and placed in trees for the bees to swarm in. Once a swarm has entered it is considered to belong to the owner to the hive. If it stays for a long time (the Dorobo say) it may be inherited by the owner's son; but if it should go from one man's barrel into another's, nothing is done, for though the Dorobo say that their bees get to know them, they do not claim to be able to control their movements. And if a swarm deserts a barrel, the owner just [323] waits till another swarm comes to it. The commoner type of honey-barrel is

[*] The workers are really females whose ovaries have become modified so that they do not normally produce eggs.

[*] This is not very far short of the truth, for bees take into their crops a substance called nectar from the flowers and deposit it in the comb. By the action of their saliva, which produces a chemical change, the nectar becomes honey, and is superintend into the cells for storage or for feeding the grubs. (Cf. article Bee in the Encyclopaedia Britannica, ed. 11, by Prof. G. H. Cunningham.)

[*] Wax is really secreted by special cells in the abdomen of the worker bee.

[*] Drones are in reality the males which mate with the queen. When the mating season is over and food is getting scarce, they are killed and thrown out by the workers.

Schlesinghaus Bd. 5 (1936–1939) 1953 FLA Dvorako FLA

their needs of bulkiness and bags. A suitable log is cut of such a length as to allow for a length of about 2 ft. 6 ins. in the finished article. Trees specially favoured for making honey-barrels are the *mosot* and *nemaiki*, on account of the ease with which they can be worked; others used are the *tmetmet*, *olignet*, *kipalmet*, *kiptenjwet*, and *nemarin*. The entire work of shaping and cutting is done with the axe. The log is then split into two equal halves longitudinally, which are then hollowed out, leaving sides about an inch thick. In the bottom of one half an oblong hole is cut, through which the bees can enter and the owner put his hand to take honey. Four holes are bored in the sides of each half with a red-hot boring-needle (Fig. 1), and when the two halves are put together, bone is threaded through the holes to hold them in place.

The *dist* barrel, not so common as the *dog-ost* because of the difficulty of making the exit-groove, is made of strips or slats of strong bark, the *mosot* and *nemaiki* trees being favourites for this purpose. The ends are formed of two solid circles of wood which have to be cut laboriously from a log and trimmed to shape. The bark slats are then put in position round the end-pieces and bound together with bone, a tricky piece of work, as anyone who has had to do a similar job will realize; and to get the barrel into place in the tree also requires great care, since it easily collapses if roughly handled. A bone hole is made in the centre side, as in the *dog-ost* type (Fig. 1, 2).

(a) Handles, (b) bar-clamp, (c) bar-bound ends.

Fig. 1. *Dog-ost* (honey-barrel).

When a man gets up a new honey-barrel, he calls out to the bees to come and settle in it.[1] The invocation to bees has a set form, and is uttered in a rather exhilarated, high-pitched tone:

Ndisek, ndisek, ee ee! ee-ee-ee-eeeee, ndisek, ee ginet![2] anyone, *ndisekisek*, bees, bees, who are in *ceretisiet*-trees-of, come-bees ! ee-ee, ginet-in-honey, *ndisekisek*![3]
ginet-in-honey.

Bees do not get ill, they say, but are liable to be killed by heavy rain. If they are caught in a storm while getting honey, they have also a number

[1] One informant says of bees in a hot, stuffy place in *kimoiwon* vengeance, 'young bees are allowed to develop, and the old queen leads off a swarm to find a new home.

[2] This shrill expression is said to be equivalent to *Kaiyos yo*, 'come here'.

[3] The Dorobo fully harnessed this honesty and shrewd it to their evil-to-evil-to-evil-to-

Gillmanlingford E-5 (1938-1939) 1953 FLA Dorobo FLA

231
232

Fig. 1.
Wax Honey-Guide.

of enemies, which eat either them or their eggs. These birds in particular are said to be fond of eating bees, a small brown bird called *sigbwandwa*, a small green bird called *kimet*, and a small black-and-grey bird called *mutebiet*. The *kimet* bird (*cuculus indicator*) cries 'kwe-kwe-kwe', and when it says that near a tree people know that bees are there; this is the bird which many Africans follow when they are looking for wild honey. The Dorobo regard it as an enemy of the bees because it gives away their natural hiding-places. Soldier ants (*pirwit*) eat the eggs and grubs (*sarok*) in the hornets. But no steps, either practical or magical, seem to be taken to protect the bees beyond the observance of certain rules regarding the eating of honey and the disposal of the comb.

The Dorobo say that bees know their owners by the smell of their bodies, and that for this reason people are stung but little when they take honey from their own hornets. But if a stranger tries to steal honey he is not recognized and gets stung badly. People claim also to be able to recognize their own bees; for if, as they say does happen, other bees settle in the hornet along with the original owners, they can distinguish the original bees by their colour and the part of the hornet from which they come. Whether or not this is true, does not matter very much; but there seems to be some truth in the statement that bees know their owners, for I have seen Dorobo take honey without the paraphernalia put on by a European for the purpose, and get stung but little and with no ill effects from the few stings they did receive.

231
[illegible]

When a hornet is put in a tree in the forest, it often has to be high above the ground, since many of the trees have no branches near the ground, and to help the owner climb a sort of ladder made of a number of thin poles lashed together is tied loosely to the tree trunk with lianas (Fig. 2). To put the hornet in the tree, and to take honey from it, the Dorobo has to climb this crazy ladder which looks as if it would slip or break with each movement, but somehow does not, and lasts, rather surprisingly, for quite a long time. To take honey, the Dorobo makes fire in a large bundle of timber. When he has got it smouldering, he takes a bunch of leaves (probably of *kitwajiwet*, *Ficus sp.*) and putting them and the timber inside his garment, he climbs up to the hornet. He blows the timber till it gives out a good smoke and then holds it under the

Fig. 2.
Diagram to show the Construction of a Ladder on a Oil-A. Tree.

6:Huntingford E-5 (1938-1939) 1953 FL6 Dorobo FL6

barrel so that the smoke goes inside and the bees come out. He then takes out what honey he wants, wraps it in the leaves he has brought, and descends, carefully extinguishing the tinder when he has reached the ground. Though sometimes the barrels are not more than a few feet from the ground, very often the process of taking honey means a climb of eighty feet or so with no help but the unsteady ladder already described.

Although honey has great ritual and social value, like milk to the Nandi, it cannot be said that bees take the place of cattle in the daily life of the people, for they require and receive no care beyond the provision of barrels and the due observance of the taboos concerning honey, and there is really no need to know very much about them. But as producers of honey, bees provide material for food, drink, and ritual, and they are thus of some importance. Honey, too, is a much-used medium of exchange. Without honey, Dorobo life would be vain and empty.

(c) Hunting

In the past, hunting was the chief occupation of Dorobo men, and though they hunt but little now, confining their activities to trapping, they have still a "hunting outlook". The conversation of Dorobo walking through the forest sooner or later turns on the animal life around them, for as we have already noted, they have what the Nandi call *emiet*, which one might almost render 'affinity', with the beasts of the forest. The sort of talk that goes on in the forest is something like this sample, which I took down after hearing it:

A. *Kelich ap tiondi.*
The dust of the animals.

B. *Ee, ai paiuet, pwee ye, wendi ye.*
Look, this one (is) the bushbuck, it comes from over there, it goes over there.
Mising, a ne misio misio, tinye kakwenyi kitokin.
Small, but not small very, it has the child small.

A. *Canik cuto tiondi, nii ameshiweyan; ameno*
(They are) more than animals, they are in our forest; I like (the things)
cuto ameni.
which are of forest.

B. *Ingwenwen alinio tiondin, ajobo nii tiond ako. Ne*
Let us look over there (at) that forest, perhaps there is the animal another. What
ai ne kakiniai ani?
(is) this that creeps about inside?

A. *Ajobo tomin.*
Perhaps the grass pig.

B. *Wain, ameneni nutii. Ingwatinye kenyando ajobo ne. A nyanii*
Yes, I see the hoof. It (i.e.hoof) the have I kill that one. But there is
kenyando.
not have the hoof.

A. *Ingwenwen ale nene.*
Let us see where it escapes (to).

6:Huntingford E-5 (1938-1939) 1953 FL6 Dorobo FL6

224 [846] [220] The year was divided, from the hunting point of view, into the dry season and the wet season. In the wet season people did not generally go out hunting, but stayed at home and set traps to catch antelopes and the like. In the dry season they hunted all sorts of game with bow and arrow in the forest and far afield. Thus, Arap Minio told of how soon after he had been circumcised he was one of a hunting party that went into North Nandi, as far as the hills Kaptepe and Tapsakoi [10] near the modern Turbo, some forty miles from the forest, in the days when there were no Europeans there; and another Dorobo spoke of hunting monkeys as far from home as Kapiyet in North Nandi. Leopard, monkey, and pig are still plentiful. Buffalo still exist to the east, in the direction of Timboroa and Londiani, but they have not been hunted by the Dorobo in recent years, in fact, they say, not since about 1900 when the Kapiele age were warriors. Elephant are no more, but they were found in this area, according to some old men, when the Sawe and Kipkoimet were warriors about 60 to 70 years ago. There are no lion in the forest, but the Dorobo occasionally shot them in the plains. Leopard used to be hunted by organized parties, but this practice has been discontinued for some years, though they are still attacked and killed by individuals if they get aggressive, as in February 1939, when Arap Singira got his lip torn in a leopard hunt at Soméyo. Sometimes traps are made for them, of wire which is picked up on the farms. But trapping leopard is not common, and the trap made by Arap Menuti which caught a leopard in July 1936 was said to be exceptional. [281] Generally they prefer to hunt a leopard with dogs, as in the old days, when if one was put up by a dog and climbed a tree, the hunter came and shot it.

[185] There is really no close season, as we understand the expression. The trapping season, which did in fact give the game a respite, was not intended for that purpose, but was for the convenience of the hunters themselves, because when it is wet, the forest is difficult to go through, the undergrowth thick, and the ground muddy and slippery; though some have been known to hunt pig there in wet weather.

[411] Dorobo hunting equipment consisted of a bow, poisoned arrows, quiver, knife, and dogs. Spears have never been used by the Kipkoreek, and the spear trap reported to be found among some Dorobo does not appear ever to have been one of their methods of killing big game. For trapping, a man needs only something to cut the materials with, and, of course, his skill; if he is to make a pit-trap, he needs something to dig with.

411 [322] [289] Bows are made mainly from the *kwiot* tree (*Teclea* sp.) and are about 5 ft. in length. A suitable piece of wood is cut and scraped with a knife-blade till it is smooth and of the right thickness. The bow-string, *kut*, is made of gut from the giant pig, *tamia*; the gut is stretched, greased and twisted till it becomes sufficiently strong and pliable for use. It is knotted to the ends of the bow an inch or so from each end; no notch is cut in the wood to receive it. Arrow-shafts are made from the *kwomandet* and *mamata* trees, as well as from split bamboo; they are smoothed with a knife-blade in the same way as

[103]

[10] Better known to Europeans as Kiboko and Kapsagat.

6:Huntingford E-5 (1938-1939) 1953 FL6 Dorobo FL6

the bow. Quivers are made of ox-hide. Arrow-poison is made from the bush called *keliot* (acocanthera Schimperi), the use of which the Nandi say was discovered by the Dorobo [16]. It is made in this way: leaves and branches are broken off and boiled in a pot for several hours. The resulting liquid is strained and boiled again till it becomes thick and tar-like. When cool it is placed on a sheet of bark, covered with another piece of bark and put in a tree out of the reach of children, together with the pot in which it was boiled. After making poison a man must purify himself by bathing in a river. *Keliot* poison acts very quickly, but does not make the whole of the animal killed by it unfit to eat. The flesh round the site of entry is cut away and destroyed, and the rest is eaten with safety.

The Dorobo used to have hunting dogs (*sokto*, pl. *sokik*) which at one time were the only animals they kept. They still have dogs, but the hunting breed which I saw in the Kelpui-Kipkorom area in 1927, seems to have died out, for though I saw a few dogs there in 1939, they were nothing more than the ordinary native type, the thin-nosed cur so common in Native Reserves and on farms wherever Africans are found. The original breed, as I saw it in 1927, had, it is true, a tightly curled tail, but was a much better looking animal, of a different shape, and much fiercer, resembling the so-called '*basenji*' dog of the Belgian Congo [17] more than anything else, especially in its prick ears, tail, and carriage, though it could bark. When in the forest, the Dorobo put leather collars on their dogs, with a small bell under the throat so that they could tell where the animals were when they put up game. It was noticeable both in 1927 and 1939 that the Dorobo treated their dogs better than Africans usually do — they paid more attention to them, played with them, and fondled them.

The traps used by the Kipkurerek are of two kinds: the pit-trap, and the springe. The pit-trap, *nguret*, is simply an oblong pit about 6 to 8 ft. long, 2 ft. wide, and 6 ft. deep, dug with digging-sticks, and the earth removed in bags or baskets. Wooden spikes, *kipuaiyeinat*, were often set in the bottom, and the whole was covered with thin sticks concealed by a layer of grass and leaves. The trap was dug across a path known to be used by buffalo, the animal it was chiefly intended to catch. This type is no longer used. The springe is the only trap used to-day. It is called *poroet*, and can be made in a very short time by almost any Dorobo. It is used chiefly to catch smaller game like antelope. The materials required to make a springe are wood, liana, and grass, and the only tool used is an axe or *panga* (the long-bladed knife or cutlass common in Africa, and now often used by Dorobo). The trap about to be described was made for me on the edge of the forest at Kipkorom by Coimin arap Katam on 9 July 1938. It took him about 12 minutes from start to finish, and did all that was claimed for it; it should be noted that he was somewhat out of practice, and probably took a little longer than a man who was constantly making traps.

6:Huntingford E-5 (1938-1939) 1953 FL6 Dorobo FL6

is to get as much as possible of the crop out of the way so that ploughing can start at once without having to wait till the crop is ripe. But the Dorobo had, all the same, made a step forward, for a solid, compact stook is less likely to be devastated by animals than plants standing scattered over a field.

By 25 November, 1938 the Kipukua people had reaped their crops. The shamba here was about an acre in extent, and was divided into four approximately equal-sized plots. There was little maize, for some had been eaten on the field and some had been destroyed by vermin; what was left had been stooked, and anything like an accurate estimate was impossible, though there might have been two or perhaps three bags in the stooks. If we estimate that the equivalent of two bags might have been eaten, and two more destroyed by vermin, we have about 6 or 7 bags, a somewhat high estimate for a crop grown mixed with eleusine, but not impossible [39]. Of eleusine, one plot yielded 3 bags, and another 2 bags (that is 5 bags from half an acre), not a great deal, certainly, but a fair yield under such conditions, and most useful as food, for the Dorobo eat most of their eleusine, and turn very little of it into beer. Maize and eleusine are ground by crushing on slabs of granite (*litrito*), and the resulting meal is made into gruel (*musarek*) for the children, and stiff porridge (*kimiet*) for the older people; it is generally eaten with a mess of vegetable food (*inguek*) prepared separately.

Storage of crops is not yet a very difficult problem. A few of the Dorobo, it is true, have built granaries of Nandi type, hidden just inside the forest to prevent thefts by the Nandi, for anyone can lift up the roof of such a granary in the night. But since so much of the maize is eaten on the field, what is left at harvest time can be stored in the loft; and the same applies to eleusine, for it does not yield a large amount of grain. I saw no millet growing, and the Dorobo said they bought it from the Nandi.

As we have already noted, agricultural labour is divided to a certain extent between the sexes, but the distinction is not very sharp, and it was found to work out in the following way:

Men:	Both:	Women:
Heavy preliminary work	Digging	
Planting	Weeding	Collecting and burning weeds
	Reaping	

The heavy work includes lopping off branches in the Nandi manner, clearing bushes, and breaking up the ground when hard. Women may also plant, but the tendency seems to be for men to do it, though there is no absolute rule against women planting. Children help with the weeding, and herd the goats when there are any; old men herd cattle, and women also sometimes herd goats.

The Dorobo had not by 1939 acquired the Nandi belief that each eleusine crop requires new land, which in the circumstances is just as well; but they do not hesitate to give up using land which is unproductive. Thus,

[39] The bag is the standard 2 ½ lb. gunny bag used in East Africa, holding 200 lbs. of maize.

6:Huntingford E-5 (1938-1939) 1953 FL6 Dorobo FL6

241
[361]

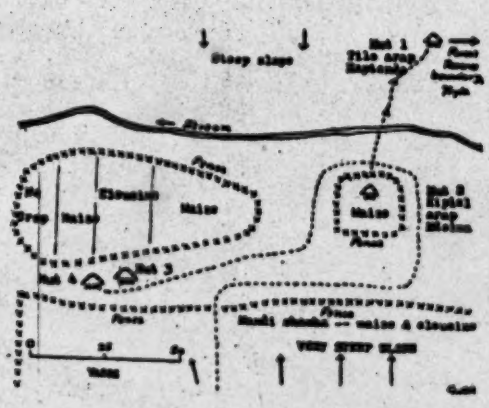

Fig. 6. Plan of a Dorobo Shamba at Kelpui alongside a Nandi Shamba.

at Kipukua in 1938 the crop was so much damaged by monkeys, pigs, and a sort of mole called *kesemiat*, that the original shamba had to be given up, and the occupiers took up new and separate plots elsewhere. Sometimes a Dorobo has a shamba all to himself; more often, however, several people divide the area inside a fence, each contributing to the labour of making it; [648] and in some cases Dorobo share part of a fenced shamba with Nandi (Fig. 6).

317 Though not connected with cultivation, we may mention here the subject of earth digging, because it is concerned with the ground. Red and white earth is found near Timboroa (or *Tambarua*, as the Dorobo call it), and men go in parties of four or five to dig it. They use nothing but a digging [482] stick, *kumet*, made of a sharpened stake, and the earth is carried home in large leather bags. In former days, when other Dorobo lived in the earth- [423] producing area, a digging party would ask leave to dig from the man who hunted over that tract of land, and though no fee seems to have been paid, it is said that if a man should refuse his consent, the party would go home without digging. But as no Dorobo now live there, this could not be verified. To-day the Dorobo sell coloured earth to the Nandi, who pay them 439 435 at the rate of 2 shillings for a large bag of earth. Red earth, *erokoit*, is used 302 mixed with fat (or sometimes *simsim* oil) for rubbing on the head; white 789 earth, *enoriot*, is used as a magical remedy in cases of homicide.

d) Cattle

231 If the Dorobo had not been in such close contact with a people whose 177 primary interest in life was cattle, it is possible that they would have contented 181 themselves with agriculture and no live stock. But their relations with the Nandi have inevitably led them to take an interest in cattle, and to think that the [556] possession of cattle is a desirable thing. Therefore they are slowly trying to acquire cattle, and are in process of making them their ultimate objective. But

6:Huntingford E-5 (1938-1939) 1953 FL6 Dorobo FL6

they have been stock-owners for too short a time, and on too small a scale to have formulated or developed any cattle customs of their own; they do not think (like the Nandi) in terms of cattle; and their main efforts are at present concentrated on trying to acquire cattle. For the last, three ways are open to them, all slow and laborious: bride-payment, gift exchange, and purchase.

Bride-payment. A Dorobo whose daughter is married to a Nandi receives for her the number of stock that a Nandi would give for a girl of his own tribe, i. e. 1 cow and 1 ox or bull, together with a variable number of goats; and when a Dorobo marries a Nandi woman he has to pay at the same rate. Arap Keter acquired his cattle from the marriages of his three sisters: the eldest, Kapotikuany, was married while his father was still alive, and on the old man's death he inherited the cattle paid for her; the other two, Cesum and Taprandic were married after their father's death, and the cattle for them (amounting in the case of Taprandic to 1 bull, 1 cow, and 5 goats) was paid to Arap Keter.

Gift exchange. Nandi from time to time make friends with Dorobo, chiefly for the purpose of getting honey. The first move after two men have come to regard each other as friends, *coruet*, is for the Dorobo to give the Nandi some honey, without expectation of any immediate return. After a time, the Nandi gives the Dorobo a goat, and thus the way is prepared for the handing over of cattle. Arap Minin became the friend of a Nandi at Ollesos called Kapkile, and eventually got from him an ox in exchange for a fur cloak; and on another occasion he got an ox in exchange for seven goats which he bought with his wages for working on a farm. Arap Korucu in his youth hunted at Kapiyet in Nandi, and shot *tisiet* monkeys, from which he made fur cloaks which he exchanged for cattle. To-day he has five head of cattle which are herded for him by a Nandi named Kipkorir arap Serem on Farm 1479: the Nandi looks after them in return for the use of their milk, Arap Korucu being given a small amount of it. This process of acquiring cattle is, of course, a form of purchase, but it is purchase under the peculiar conditions of forming a friendship by exchange of gifts first. The Nandi do not readily part with their cattle, and it is therefore necessary to lead up to the final stage, as the Dorobo regard it, by the preparatory exchange of other things. And as a method of acquiring cattle it is limited by the fact that the Nandi seem willing to exchange only male stock in this way, so that for female stock the Dorobo have to rely on bride-payment.

Purchase. The Nandi do not sell cattle to the Dorobo except as just described, that is, in the form of bride-payment or by exchange. But they will sell goats for cash. The Dorobo do not seem to care about sheep, for in 1939 none possessed any.

At the time of their move in 1937 the Dorobo were credited officially with a large number of cattle, some 2000 head in fact. But in 1939 the actual numbers that I saw and counted (and I have reason to believe that these were practically all they had) were very much smaller. The following list, while it may not be perhaps completely accurate, gives a truer idea of the real numbers. It will be noticed that there were few goats; some were undoubtedly

6:Huntingford E-5 (1938-1939) 1953 FL6 Dorobo FL6

missed in the count, but they are used even to-day so much for medical and magico-religious purposes that there is a constant drain on them.

The numbers that I actually counted in the three *korosuek* of Kipkorom, Kelpui, and Sosoiyo were:

		Cattle:	Goats:	Dogs:
Kipkorom:	Arap Keter (Cesundil)	10	—	—
	Arap Menati	—	10	2
	Arap Korucu	5	—	—
	Arap Minin	—	5	2
	Arap Keter (Kipsan)	5	—	—
Sosoiyo:	Arap Silimbo	20	—	—
	Arap Euni	3	—	—
	Arap Singira	—	—	3
	Arap Ceruiyo	1	—	—
	Kiken arap Silena	15	—	—
	Korionoi arap Munyenua	15	—	—
	Kiptoo arap Ngamnam	—	5	—
	Kisorio arap Lengei	—	10	—
	Kaola arap Ngamnam	—	4	—
Kelpui:	Arap Mateko	5	—	—
	Samupai arap Yator	6	—	—
		90	34	7

3. The Economic Division of the S. W. Corner of the Forest

The forest is regarded by the Dorobo as their special territory. Not only is it divided between the *korosuek*, but families have rights over parts of it, and these rights pass from father to son. The place where the trees come to an end forms a natural boundary and within that boundary was Dorobo ground where few strangers, except the occasional outlaw or fugitive, cared to penetrate. A man's forest rights included hunting, trapping, setting honey-barrels, and food-gathering. If anyone wished to do something on another man's ground, he might do so with the occupier's permission. A section of forest was not the absolute property of an individual and ratified by a pronouncement of the *koret* council, but was held on a tenure based on the fact of hereditary occupation sanctioned by public opinion: a man's section was automatically taken over by his son and this succession was recognized by the people.

The forest appeals to the Dorobo in four ways: (1) In the trees they had their homes, and they knew no manner of living in which there were no trees; trees therefore go with the land, which in fact does not count as land, but as something which bears trees. The cutting down of one or two trees on a man's section is his own affair, but if people should begin to cut down many trees, public opinion would be against them: *ngul komac Ohiot si kotil kotil ca cau, mecome Ohiet alak*, "if a Dorobo wanted to cut down many trees, the

6:Huntingford E-5 (1938-1939) 1953 FL6 Dorobo FL6

other Dorobo would not like it", in the words of one old man. (2) The animals on whose flesh they feed and with whom they themselves have something in common, live in the forest. (3) In the trees live the bees whose honey they eat and drink, a substance as valuable to them as milk to the Nandi. (4) The forest is not only the medium of their life, but their protection. And so even to-day when they can no longer live in the forest, they still think of it as their own, and the division of the parts beside which they have made their settlements is of the utmost importance to them.

The division of the south-west corner of the forest between Kipkorom and Sosoiyo as it was in 1939 is shown in the Map. The forest is here divided into several unequal areas, bounded on the NE side by the main through-track from Kipkorom to Sosoiyo, and crossed also by the other through-track from Kipukua to Sosoiyo. The main track is used a good deal by the Nandi who go to see their friends and relations on the farms in the Meteitei valley; the other track is used mainly by Dorobo, and their honey-barrels and traps occur mostly along it, whereas there are none on the main track because strangers might interfere with them.

Between the two main tracks is the Ain ap Tinet, a stream which forms the northern boundary of the areas held by the Kapkolelac (I), Kapsituni (II), and Kapsingira (III) families, the last of which extends eastwards towards the main track. Group N° I is represented by Arap Keter, Kipungei, and Kipsan, three brothers; N° II by Arap Minio; and N° III by Arap Singira. The occupiers of I and II live at Kipukua, and of III at Sosoiyo. The Ain ap Tinet is the southern limit of the area held by the Kamuru (IV) represented by Arap Korucu who lives at Kpkorom, his land reaching to the main track. East of the main track, area N° V is held by the Kapcepouaita family represented by Arap Ceruiyo and his brother Arap Cepouaita who live at Ndoroton. Above this is area N° VI, held by the Kaptokoni, represented by Korionoi who lives at Upper Sooiyo in the forest. And finally N° VII is the easternmost area, occupied by the people who live at Upper Ngatepkoo in the forest and Lower Ngatepkoo ouside it. These are a mixture of six families: Kamnasutik, represented by Tatē; Kamereua, represented by Nekoi; Kapkorongos, represented by Kilanyi; Kapkimancari, represented by Arap Euni; Kapkipopo, represented by Kiprec; and Kapkuikoi, represented by Sulio[21]. These holdings are clan areas as well (except in the case of N° VII where four clans are represented, and the livision could not be satisfactorily traced):

I. Family Kapkolelac II. Family Kapsituni IV. Family Kamuru	Clan Moi.
III. Family Kapingira	Clan Kipieken.
V. Family Kapcepouaita	Clan Kipamui.
VI. Family Kaptokoni	Clan Kapsekoi.

[21] The prefix *Kap-*, besides meaning "place of", also means "family of", and is added to the name of a principal recent ancestor, who may be a woman, e. g. *Kapsituni* is named from *Situni* the wife of Arap Minio's father's father.

6:Huntingford E-5 (1938-1939) 1953 FL6 Dorobo FL6

423 It will be seen from the map that honey-barrels and traps are the main forest activities, the shambas being outside the limit of the trees.

The Dorobo had developed a habit of saying that there were no honey-
[231] barrels in the forest. Certainly this would seem to be true to anyone who goes through the forest along the main track from Kipkorom, for there one sees no sign of any activity at all. But on the other track, where few but Dorobo go, there are plenty of them, especially in Area I where Arap and his brothers are very active, several of the barrels near the path belonging to his unmarried half-brother Kipungei. In Area II there are not so many,
[886] because Arap Minin regards himself as an old man by now, and unable to work much (he is actually — in 1939 — about 40); his brother Arap Ruto works on a farm and is less active in the forest than Kipungei. But Arap Minin has at least two honey-barrels, which he showed me, as well as a trap
[487] in which not long before he had caught a bushbuck. A few paths branching off the main track which had once led to traps could still be distinguished, though they were not used in 1939. In Area III there was a new path leading to a trap made by Arap Singira some way from the track. In Areas VI
[361] and VII some of the people still live in the forest in the old type of Dorobo hut, the *koconget*.

Now these areas are not very extensive. The space of forest occupied by Areas I-IV is perhaps not more than six square miles or thereabouts, and that of Areas V and VI may not be more than four square miles. But a mile on the map is a very different thing from a mile on the ground in an African forest. The Dorobo have been forced by economic pressure to concentrate; and since the adoption, even on a small scale, of agriculture, the dependence on hunting has naturally been reduced. In addition to each forest area must be reckoned the strip of open land where they live, cultivate their little shambas, and herd their few livestock. Moreover the central and unoccupied part of the forest is open to anyone who chooses to hunt there, though there were no indications in 1939 that they actually did so. In the old days the
177 forest areas may have been larger, though when all the *korosuek* were occupied
423 there cannot have been very much difference in size. But a relatively small area is enough for bee-keeping, trapping, and food-gathering, and it must be remembered that in the past, before the forest people's economy was disturbed,
[224] they ranged much further afield to hunt with bow and arrow than is possible to-day, and the forest was primarily regarded as a trapping area. Various statements leave no doubt that the Dorobo used to hunt right over Nandi and Uasin Gishu, as well as in the high country east of Timboroa. Thus, though their own territory was limited in extent, their dry weather range was wide, and the supply of game more than adequate to their needs [1].

114 [1] This paper deals with conditions that existed up to 1940; the use of the present tense must be taken as referring to that period.

7: Wayland N-5 (ca. 1926) 1931 FL6 Dorobo FL 6

Physical Characteristics.—The Wanderobo, although on the whole shorter in stature than their neighbours, are by no means a dwarf race. They resemble, very closely, the Dodotho and other tribes of Karamoja (Pl. XXVII, Figs. 3 and 4). A few measurements are appended. 142

The Village.—The Wanderobo village (*chewe*) is characteristically situated on the edge of a very steep or precipitous slope (Pl. XXVIII), and has an inner and outer stockade, added to which every hut (*ko, gubai*) within the village is itself stockaded. Within the villages the huts are grouped in twos or threes so as to communicate, by means of a small opening in the stockade through which one can only crawl, with a tiny compound in which there are two or three groups of cooking stones. Similar doorways, easily closed by means of a raft of sticks tied together, lead from one compound to another. The whole effect is very much that of a compact maze. The huts are very small, but some of them have two stories (Text-fig. 20), the lower for habitation and the upper, which opens at the side, for storing grain and property; 361 342

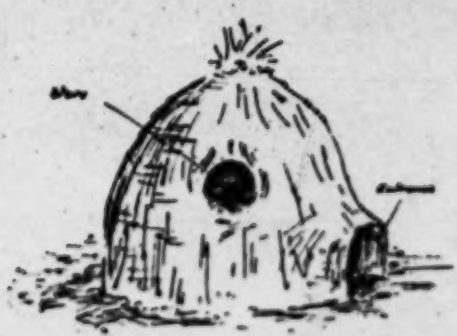

FIG. 20.—AN ANDOROBO HUT (*Tulai*).

they are built of grass, and in some cases the entrance has a little portico. The compounds and huts are kept very clean, and all dirt and rubbish is swept up and dumped outside the village, the limit of which, away from the scarp, is determined by a semi-circular drain that protects the village from run-off during rains. 356

Dress and Adornment.—This is essentially the same as that found among the Labwor, except that circumcision, apart from the ceremonies, seems to be but little practised. 291 [304]

Livestock.—The Wanderobo are essentially a race of hunters, but they have obtained a few goats from the Dodotho, and they keep dogs. 231 ●

Agriculture.—Cultivation is on a small scale, and is generally undertaken at a distance of some miles from the village, in a valley from which they procure their water. The Wanderobo are the tobacco growers of Karamoja, and as an example of the shortness of tribal memory it may be noted that the people say they have always grown tobacco (*lotuk*). In addition to this they grow a little sesamum (*ecoton*), indian corn (*ngaburripi*), and millet (*ngyp*). A form of 241

/54/

58. The Dorobo

The last name on the list of predecessors in the occupation of the land now held by the tribes of the Unit is Dorobo. Here again there have been much confusion and lack of definition, and in spite of the continued existence of 'pockets' of so-called Dorobo in many parts of East Africa we find ourselves beset with difficulties if we try to give a synoptic ethnological interpretation to the very numerous facts. Some would lump all the Dorobo together with the other trapping tribes and call them aboriginal hunting people of a Bushman type, explaining obvious departures from that type by infiltrations in varying amounts of Hamite and Negro blood. Others (including many Africans) think that the difference between them and the other tribes is simply one of culture[1], not of origin, that the Dorobo chose to stay a step behind while the others, due in part to population-pressure, moved from the hunting-trapping-gathering stage to that of herding or herding-planting.

59. Joseph Thomson, in Through Masailand, written in 1883 or thereabouts, gives the following account:

> "This tribe - the Wa-ndorobbo of the Wa-swahili - is a small race of people scattered over Masai-land who gain their entire livelihood by the chase. They neither keep cattle nor cultivate the land. The antelope, the buffalo, and the elephant supply them with such meat as they may desire, while they always find neighbouring tribes, less skillful in hunting, eager to exchange vegetable food for game. The elephant, however, seems to be their staple food, and as a rule the Andorobbo are to be found only where those animals abound; as for instance

1. To the Mwimbi at the present time Mwathi signifies a Mwimbi who, while engaging in hunting and trapping, lives in a settled village among the agricultural Mwimbi, while Dorobo signifies a Mwimbi (or anybody else) who lives in the forest and takes no part in agriculture.

/56 cont'd/

Physically, the Dorobo vary greatly, presumably according to the amount of mixture of other races in their blood. Some are very like the Bushmen, and therefore retain their oldest characteristics, whilst others are now almost indistinguishable from the semi-Hamitic negroes, having lost their original characteristics and having adopted many of the Hamitic methods and customs. They, however, retain their primitive dwellings, and, except in Northern Karamoja, as far as I know, the Dorobo keep no domestic animals except the dog. Being by nature hunters, and semi-nomadic, it is not expected that their numbers will ever increase greatly, but they will in time become totally absorbed in surrounding tribes ... In the country now occupied by the Kikuyu there were once dwarf peoples akin to the Dorobo (or their predecessors) and the Agumba. The Kikuyu are a Bantu tribe ... They attribute their origin to the Kamba. They are invaders of the highlands, where they split up, exterminated or absorbed the original dwarf-like inhabitants, known as Agumba and Dorobo ... The present density of population of the /57/ Kikuyu is comparatively recent. They are comparatively recent migrants into the highlands. The less fertile plains previously occupied by them were not rich enough, and a growing need for land gradually forced them up to the forest belts of Mount Kenya, destroying or absorbing the aborigines as they advanced ... In the A-Chuka section, one may observe Kikuyu with Bushman-like features as a result of their absorption of the primitive Agumba and Dorobo, whilst in other sections, the Kikuyu show a more Hamitic type of countenance as a result of Masai domination ... the Dorobo have been here for many thousands of years, being probably the original or almost the original inhabitants..."

174 [144] [231]

61. But we should certainly not be justified, without further evidence, in assuming that all these hunting people were closely related or had a common aboriginal ancestor in Africa merely because they can be conveniently classed together as hunting tribes.

/64 cont'd/

"to have occupied the land along both banks of the Aboni[1] or Amboni River. They intermarried and traded in famine years with the Kikuyu, and cannot remember having come from any other part of the country. For the most part, they lived apart, hunting in the /85/ Loldaika Hills. Between 1905 and 1912, when the alienation of land to Europeans took place, they were pressed northwards to their hunting grounds, and eventually settled down with the Mukogodo, having acquired cattle from the Masai and early traders, such as Mr. John Boyes. They included the El Choki plains within their gazing area. Their language is similar to Masai."

648
101

Mr. John Boyes told the Commision of a meeting between himself, a Dorobo chief Olomondo, and the Kikuyu chief Wangombe, and Wangombe's son Ndirango, in a memorandum o the Commision, speaks of "Chief Olemondo of Dorobo of Donkeys". The Dorobo referred to are clearly the Ndigiri[1], that being he common Kikuyu word for 'donkeys'.

The "Dorobo Commitee" classified the Lodigiri among the group living north of Laikipia and Mr. Huntingford puts the Digiri among the true Dorobo of his Eastern Group.

101

---

1. The Gaki Kikuyu also call this river Moni. Aboni in Kikuyu means "the Moni people", and boni may be related to an original Nyika stem boni (f bilabial) which, prefixed by i, would give miboni in Ndia and boni in Kikuyu. Some relationshipbetween the Ndigiri and the Coast Boni might possibly be indicated.

1. Perhaps it was among the Dorobo that the Kikuyu first saw donkeys, which appear to have been unknown to the Bantu tribes of the Unit until comparatively recently. A Nyeri elder told me that the Ndigiri used donkeys instead of women for th transport of the meat of animals killed in the chase.

[492
231]

They are said to be very prolific, having families of eight to ten children, but the infant mortality is so extremely heavy that their numbers increase very slowly; this mortality is probably due to the cold, damp climate of the Kiru Forests, which are at an altitude ranging from 7,000 to 9,000 feet. (43) (45) (132) (133)

Their game ceremony consists of cutting off a dog's ears, and the contending parties then spatter one another with the blood. (125) (297)

They live principally on Colobus and other monkeys, which they shoot in the forest. At certain seasons, however, they go and hunt big game on the plains, known as the Enagata Kyuki; they wait till the grass is dry, and then burn it to facilitate their hunting. They use poisoned arrows for big game, and unpoisoned ones for monkeys, &c. They train dogs to assist in their hunting, and are very keen to get young dogs for this purpose. They told me that they first gave the dog certain medicines, and the animal would then track game. 234 (242) (411) (151)

They are very clever elephant hunters, and informed me that when they came across an elephant they went off and hunted and scrubbed themselves very carefully to remove all trace of the human scent, and that they were then able to approach a sleeping elephant and spear it with a poisoned dart. (216) (126)

They are most expert in the use of a fleshish. The fire is produced in the ordinary way by the friction of one stick upon round vertically in a depression in another piece of wood, which is held firm between the bare feet of the operator; the lower piece of wood appeared to be the juniper of Kiru. 372 (124)

A small vocabulary of their language is appended on the opposite page. They use the Kisuli numerals. (187) (77)

The prefix "ki," and the suffixes "-ai," "-i," and "-ik," are, I think, brought in from the Kisuli language, but most of the roots will be found to be quite distinct. Many of the tribe can only speak Kisuli, and when collecting this vocabulary in many cases they appeared to have forgotten the Ogglish or Ossuth word but gave the Kisuli word, and had to search among themselves and, as it were, hunt up the proper word. The language is thus evidently dropping into such disuse that it will probably become quite extinct in the near future. (115) (112)

C. W. HOBLEY.

[P.T.]

[P.192, B]

and by personal ability, and therefore to some extent by their geographical setting. They have no iron ore, no metallurgic knowledge, and so all ironwork is imported from the Nandi. Tobacco, which they like, is not grown as yet, and this too must be obtained from the Nandi. There is a regular exchange of honey, skins, and baskets, for arrowheads, knives, tobacco, seeds, pottery, etc., and a scale of exchange values has come into existence:

1 arrow head is given for a gourd of honey.
1 bundle of tobacco is given for a bag of honey.
1 large pot is given for a large bushbuck skin.
1 small pot is given for a duiker skin.
2 basketfuls of seed for one basket.[a]

Sometimes personal services are given, e.g. a day's weeding in the smith's garden for two knives.

Cattle are obtained from the Nandi, to a limited extent, by a system of gift exchange for fees. The Nandi make friends with the Dorobo chiefly for the purpose of getting honey, and the Dorobo will give meat to his Nandi friend without expectation of an immediate return. Presently the Nandi gives the Dorobo a goat, and this exchange of gifts paves the way for further and more important transactions: eventually the Dorobo offers his friend a fat cloak for an ox, as e.g. my friend Arap Mitoig acquired one from a Nandi called Kapkile at Ollessos; he also got another in exchange for 7 goats, which he bought out of his wages for working on a farm.

C. Techniques

1. Hunting

The dry weather, *amotionik*, is the shooting season, and the wet weather, *ilmit*, is the time for trapping. The weapon is the bow and arrow (spears are not used by the Kapchepkendi Dorobo), and the hunters use dogs.

In wet weather buck are caught in traps. In the dry season, wild pig of various kinds[b] were

[a] A honey-bag is about 12 ins. deep and 9 ins. wide; a container about twice as much honey as a gourd. A basket (*kerogut*) is about 9 ins. deep and 6½ ins. wide at the top.

[b] Female, the warthog (*Phacochoerus aethiopicus*); and tusker, the giant hog or bush-pig (*Hylochoerus meinertzhageni*).

[P.193, A]

hunted by concerted action, and still are, to a [illegible]
limited extent, by individuals, as well as several
species of monkey.[1] There seems to have been
no very strict close season, as pig were considered
by hunted in the wet season, though not often,
since the forest is difficult to traverse when wet.
There are now no lion or elephant, but they are [illegible]
said to have existed when the Tana and Ewaso
nyiri again were young men, i.e. about 1860. [illegible]
Leopards are still common, and are still shot if
one runs up a tree after being put up by dogs. [illegible]
They are sometimes caught in traps made of wire,
which is not bought, but searched for or stolen
from farms. However, a trap made by one Arap
Mogoni which caught a leopard during one of my
visits was said to be exceptional. Buffalo no
longer exist in the western end of the forest where
the Kapchepkond live, but they occur near
Lowdiani, a few miles to the east.

Hunting parties varied from two to eight men.
If, say, eight went out, half would go along one
bank of a stream, and half along the other bank,
so that one or other party would be sure to get
something. They met after the kill, and cooked [illegible]
the meat and ate some of it on the spot. The
rest was divided among the hunters and taken
home for their families, the unsuccessful members
of the hunt receiving a share from those who made
the kill. The hunter has to provide, not only his
own (elementary) family, but also his father,
mother, and wife's father with meat, and the
distribution of meat is in order of priority, to:—

Hunter: What is

1. Wife and children.
2. Father and mother.
3. Wife's father.
4. Neighbours (elementary).

A man has (or had till they were evicted by the [illegible]
government) an hereditary right over a piece of [illegible]
forest, which included hunting, trapping, bee- [illegible]
keeping, and food-gathering. Other people who [illegible]
wanted to hunt there asked permission to do so, [illegible]
but otherwise the right-holder might kill anyone [illegible]

[illegible]

[illegible]

[illegible]

[illegible]

one down each side of the nose, and one down the centre of each cheek.

Now it seems that a particular material is not always essential, i.e. for a Swedish officer a goat or a sheep may be killed to get the object, and a sick man may be anointed either with goat's fat or with butter (though it must be a she-goat). An alternative is thus sometimes just as effective. But an essential feature is that the remedy must be something that is not easy to obtain; till quite recently, few Swedes had any goats, sheep, or cattle from which they could get the necessary fat, object, or butter, and even were many still lack them; nor does anybody keep a permanent stock of white earth in his hut. The whole procedure is an act of faith, as much as anything else, and entails a possibly laborious search for the necessary material. There is also an economic implication, for when people have no stock they must buy the animals they need, or that into what might seem to be a purely ritual transaction, enters an element of business.

UK Archive—GB 0-5 (1900-ca.1949) 1910 PLIS Ahmi
Service PLS
Ahm

(100 cows.)

If one finds them cross, one tries, as well as one can, to appease the stomach with wild roots or tubers, with berries or other small fruits, with honey and honey beer. Meat is seldom eaten raw, usually boiled or roasted on the open fire. For storage it is cut into long strips that are hung to dry in the sun. When the meat is well dried, it is stored away in the aforementioned ox, close to the canoe-canoe and small livestock, which are bought from the Ahmi for ivory, are not kept, but slaughtered immediately. Insofar as the Wandamba, in barter with missionary tribes, are able to come into the possession of vegetables, they also live on them, but actually only during times when, for some reason, only little game is to be had. Otherwise the vegetable food acquired by trade constitutes only a side dish, especially for women and children. Many of them labour with and have this as the fact that their stomachs, accustomed only to meat diet from early childhood, do not tolerate it. Some go so far as to throw away the skins of a slaughtered cow, although they eat that of a dead piece of game. There indeed seems to be no doubt but that the previously mentioned Ahmi belief, according to which milk and meat must not be brought together, rests on these customs. Besides meat, honey beer, which they make in the same way as the Ahmi, also serves them as a beverage. The latter price that made by them more than their own, which probably rests on the fact that the Wandamba keep the good honey for themselves and sell only the inferior kind. Men, women, and children eat together. Both the husband and the wife, his wives, and children and, on the other hand, those for the youth and his favorite girl are cooked in one pot. From this the food is poured into small wooden bowls (Ahmi), of which each adult dancing in the ward has his own. From the food laws of the Ahmi, the custom that young unmarried men may not drink honey beer is still found here as a survival. Tobacco is a luxury of the married. Men smoke it, coarsely cut, in pipes carved by themselves. Ground to powder and mixed with a little soapy ash and [illegible] fat, it serves both men and women for snuffing. Women also like to chew the stuff.

294 412 293 /233 cont./ As there is the tanned hides are sewed into articles of clothing with an awl (manyanga) and a thread twisted out of animal tendons (ang). If a number of hides for which, at the moment, one has no need for one's own use has piled up, a few old men with women and children, laden with skins and also maybe salt, set out for a neighboring area. Where the distance between this and the Wandorobo camp is such that it permits frequent trade, these caravans appear at the regularly held markets. If, however, they are able to come only rarely, they peddle their wares, inasmuch as, out of ignorance of time reckoning, they do not wait for the market days. They readily find customers, since both articles are very much in demand. The agriculturist principally dependent on a vegetable diet always needs salt, but he can only rarely extract it himself, since as a rule the arable soil contains no salt or such not in sufficient quantities. The need for hides /234/ is also often greater than the local production, even today when fabrics have largely replaced the leather clothing. After protracted haggling, an agreement is finally reached, and the Wandorobo, satisfied, set out for home with the harvest vegetables. If the hunting was sometimes particularly lucrative or if an elephant or rhinoceros was killed, part of the meat would also be sold to the always meat-hungry agriculturalists. Many of the latter, for example, the Watatia and Wakambe, also buy the meat of predatory animals from the Wandorobo, whose disdain is altogether, and therefore, in trading, they set such piece for small and cute.

231 [889] Old men, who only now and then in the evening lie in wait for game at a watering place, devote themselves outside the camp especially to the checking and supervision of the beehives (Fig. 8b), a large number of which hang within an hour's range. These are wooden tubes 120 centimeters long and /Fig. 8b appear less/ 40 centimeters thick, with an interior breadth of about 20 centimeters. They are made by hollowing out a correspondingly long piece of tree trunk, a very arduous task because the tools are so primitive. After the trunk, through hewing with an ax, appears circular in cross-section and tapered at both ends. It is smoothed on the outside with a knife (pandyng). Two instruments are used for the hollowing out

other scavengers. Nowadays, all hunting activities are carried on illegally with the risk of being punished if caught by the police.

Weapons are the bow and poisoned arrows carried in a quiver. Knives are used to skin game and to make springes. Spears have never been used. The Dorobo used to have hunting dogs, but in the North Tinderet Forest the breed seems to have died out, though it existed in 1927. They have two kinds of trap: (i) The pit trap, agwet, formerly used for buffalo, consisting of a pit 8 ft. long, 3 ft. wide, and 8 ft. deep, with wooden spikes set in the bottom. (ii) The springe or snare, *furmwet*, which consists, briefly, of a springy stick bent over, with a noose attached to it connected with a platform: the arrangement is such that when an animal treads on the platform its head enters the noose, and the pressure on the platform releases the springy stick, which flies up, tightening the noose, and holding the animal suspended. Such traps can be made in less than ten minutes. This type is used chiefly to catch antelopes, but leopards have been caught in them. Close-bar traps with a drop-spear were not used by the Kipkaronds Dorobo.

The only hunting taboo recorded is that the night before he goes out hunting a man must abstain from sexual intercourse. This does not apply to the setting of traps.

As regards land rights, the forest was divided into districts, *kwet*, pl. *kwenwek*, and in the district each man had an hereditary block of land in which he hunted, set traps, kept his honey-barrels, and collected wild food. Occupation rights were recognized by public opinion, and trespass on a man's forest area, i.e., deliberate entry in order to start hunting without permission or the presence of a piece of meat, might result in the trespasser's death at the hands of the owner, who would then have to pay compensation for homicide. Theft of game from a trap is said never to have occurred, not only because the thief might be killed, but because his belly would swell to a great size and he would die after eating meat stolen from a trap.

Bees

Honey is to the Dorobo what milk is to the Nandi; it is "sacred," and its supply must be protected by the observance of taboos. Fruit and blood must not be taken on the same day as honey (though meat may be eaten); when a comb is emptied, it must be carefully hidden in the undergrowth; and after eating honey a Dorobo cleans his hands in earth, not (like the Nandi) by wiping them with leaves.

The Dorobo recognize four varieties of bee: *arkomwit*, the honey-gathering kind; *emeik*, solitary bees which live in trees; *kwenwek*, earth bees, which live in the ground; and *tigindiondi*, stones bees, which live in cells made of earth and particles of stone cemented together by their own saliva. The Dorobo divide the honey-bees, *arkomwit*, into three kinds: the queen, *kwenet ap arkomwit*, "the mother of the bees"; the workers, called simply *arkomwit*, considered to be males, which make honey by eating the "sap" (*pich*) of flowers and then vomiting it into the empty honey-combs; and the drones, *kapsowwek*, considered to be the females which do nothing useful.

Hives or honey-barrels (*kwenet*) are made either of slats of wood tied together with creeper wooden and grasses, or of the two halves of a piece of log split lengthwise and tied together. They are set in trees, and when a new hive is put up the owner calls the bees, in a high-pitched tone, to come and occupy it: "Bees, bees, from all the country, come into mine, and grow to honey, grow to honey." Bees are said to recognize their owners by their body-smell, and do not sting them when taking honey. Frequently taking honey does not appear to be a guarded or dangerous process to the Dorobo owner. Theft of honey from a barrel is considered very low, and a man might kill a thief, though he would have to pay compensation for homicide.

Honey is an important article in Dorobo economy: it is eaten as food, made into an intoxicant, used for ritual purification, and is known as an article of commerce.

6:2Huntingford E-5 (1938-1939) 1953 FLA Dorobo FLA

that made of hollowed-out logs. A suitable log is cut of such a length as to allow for a length of about 3 ft. 6 in. in the finished article. Trees specially favoured for making honey-barrels are the *mosot* and *rewendet*, on account of the ease with which they can be worked; others used are the *tenetuet*, *sikipuet*, *kipukuet*, *kitpuetpuet*, and *murwein*. The entire work of shaping and cutting is done with the axe. The log is first split into two equal halves longitudinally, which are then hollowed out, leaving sides about an inch thick. In the bottom of one half an oblong hole is cut, through which the bees can enter and the owner put his hand to take honey. Four holes are bored in the sides of each half with a red-hot boring-needle (Fig. 1), and when the two halves are put together, lianas is threaded through the holes to hold them in place.

The slat barrel, not so common as the dug-out because of the difficulty of making the end-pieces, is made of strips or slats of strong bark, the *mosot* and *rewendet* trees being favourites for this purpose. The ends are formed of two solid slats of wood which have to be cut laboriously from a log and trimmed to shape. The bark slats are then put in position round the end-pieces and bound together with lianas, a tricky piece of work, as anyone who has had to do a similar job will realize; and to get the barrel into place in the tree also requires great care, since it easily collapses if roughly handled. A bark hole is made in the under side, as in the dug-out type (Fig. 1, *b*).

a, the two halves, separated; *b*, the two bark-slat ends together.

Fig. 1. Dug-out (honey-barrel).

When a man puts up a new honey-barrel, he calls out to the bees to come and settle in it [illegible]. The invocation to bees has a set form, and is uttered in a rather sanctimonious, high-pitched tone:

[illegible]

Bees do not get ill, they say, but are liable to be killed by honey-[illegible] if they are caught in a storm while getting honey. They have also a number

of enemies, which eat either them or their eggs. Three birds in particular are said to be fond of eating bees, a small brown bird called *sepkerankwe*, a small green bird called *kiatet*, and a small blackish-grey bird called *sentekiat*. The *kwoiat* bird (*cuculus indicator*) cries 'kw-kw-kw', and when it says that near a tree people know that bees are there; this is the bird which many Africans follow when they are looking for wild honey. The Dorobo regard it as an enemy of the bees because it gives away their natural hiding-places. Soldier ants (*pirenik*) eat the eggs and grubs (*sarek*) in the hornets. But no steps, either practical or magical, seem to be taken to protect the bees beyond the observance of certain rules regarding the eating of honey and the disposal of the comb.

The Dorobo say that bees know their owners by the smell of their bodies, and that for this reason people are stung but little when they take honey from their own hornets. But if a stranger tries to steal honey he is not recognized and gets stung badly. People claim also to be able to recognize their own bees; for if, as they say does happen, other bees settle in the hornet along with the original swarm, they can distinguish the original bees by their colour and the part of the hornet from which they come. Whether or not this is true, does not matter very much; but there seems to be some truth in the statement that bees know their owners, for I have seen Dorobo take honey without the paraphernalia put on by a European for the purpose, and get stung but little and with no ill effects from the few stings they did receive.

231

[477]

When a hornet is put in a tree in the forest, it often has to be high above the ground, since many of the trees have no branches near the ground, and to help the owner climb a sort of ladder made of a number of thin poles lashed together is tied loosely to the tree trunk with lianas (Fig. 2). To put his hornet in the tree, and to take honey from it, the Dorobo has to climb this crazy ladder which looks as if it would slip or break with each movement, but somehow does not, and lasts, rather surprisingly, for quite a long time. To take honey, the Dorobo makes fire in a loose bundle of tinder. When he has got it smouldering, he takes a bunch of leaves (*preferably of Kigelia sp.*), rolls up and putting them and the tinder inside his garment, he climbs up to the hornet. He blows the tinder till it gives out a good smoke and then holds it under the

2: Maguire G-5 (ca. 1926) 1927-28
FL6 Dorobo FL6

For the sake of brevity and clarity I have set forth the following notes under separate heads, each head being devoted to one type of Dorob.

Il-Baiskye

The *Baiskye* Dorobo live mainly with the Masai. Some of them are poor, but many have acquired herds of cattle. A *Baiskye* elder named Payiana, living at present with the Masai of the Moipo area,[1] as one of the largest herds in the southern part of the Masai Reserve. The *Baiskye* follow Masai customs and methods of life except when they are prevented from doing so through poverty. The acquisition of a few cattle immediately converts a *Baiskye* Dorobo into a Masai, to all intents and purposes,[2] and his women have not that instinctive distaste for living among and sleeping in close proximity to cattle evinced by their Dorobo women. The *Baiskye* have no language except Masai,[3] will tell you that they *are* Masai and are admitted by the Masai to be the same as they are themselves. None the less, it is interesting to note that the habituated eye cannot often pick out the *Baiskye* from an assemblage of Masai, particularly if the *Baiskye* present be elders. The reason for this is, I think, that the privations these people have been forced to undergo in the past have left their mark. There is something *forworn* in the physiognomy of the *Baiskye*, common to all natives who have, at one time or another, lived by hating and away from their fellow-men.

In this connexion it is of interest to note that Sir Claud Hollis, in an article in *Man* (December 1909), mentions the fact that he once met some Masai-Dorobo in the Rift Valley who did not speak Masai (*see* p. 138 and other references *infra*). I think that the tentative theory advanced by him that

---

Wanampo, whose article in the Celtic connexion that of the Dorobo to the Masai, were all speak this, though they formerly had a language of their own (which some still remember), and, further, that the custom of the Dorobo [illegible]

[1] The area bordering the Pongani river, north-west of Kisumu.

[2] Mr. [illegible], Magistrate, in a recent article in the *Journal of the African Society*, makes a passing reference to the *Baiskye*, whom he considers to be entirely unassimilated Masai.

[3] Except fragments of course. A certain number of Masai in the Kisumu area speak this tongue, likewise many Dorobo.

000 Africa, East. Hobley.

Notes concerning the Kikuyuns of Mount Kenia, British East Africa. By C. W. Hobley, Assoc.M.Inst.C.E., Local Correspondent of the Anthropological Institute. 17

To the west of Kenia country, in the Mau Forest north-west of Mount Trident, live a tribe of so-called Dorobo people, who, like other branches of their race, exist solely by hunting, and possess neither flocks nor herds, neither do they cultivate the soil.

By the Masai they are called the Ogiek, and they call themselves the Ondik. They have intimate relations with the Eastern Masai, and generally speak the Masai language; in fact, members of the young Masai men, for whom the law "spearing the lion" is absolute, leave their homes and go and settle among these people for some years, and probably marry Ogiek women. It is their ambition to discover what is the true aboriginal type of the race. The representatives with whom I have come in contact had, however, rather complexions than the majority of the Masai, and had very peculiar eyes, which reminded one somewhat of the Mongolian type. In height they averaged 5 feet 6 inches to 5 feet 10 inches.

513 Their dwellings resemble are very simple; the natives usually possess the labor of the girl with some few cattle from the veg of the "ndinda," or wild date palm, and a few sundry other chattels, as "kanzuri," and value among the Masai.

[10]

be found hunting on his area, though he would be liable to pay blood-cattle for homicide. 423 [682]

As for trapping, it is said that nobody steals meat from traps because their bullen would swell to a great size if they ate stolen meat. Public opinion, too, is strongly against such a mean action, and is of itself a powerful deterrent. Nowadays trapping is the chief source of meat, and the common practice is for a man to set three or four traps at a time in different places, and to visit them every two days or so to see if anything has been caught. 224 [685] [434]

Monkeys and birds[1] are killed for their meat and skins; pig provide meat and gut for bow-strings. [237]

2. Agriculture.[2]

The Dundee are in process of changing from a hunting to an agricultural existence, from the uncertain hunting economy to the more certain one of agriculture; and the more economic pressure which has forced them to till the soil is now encouraging a desire for cattle, which are being slowly and laboriously acquired. This leads in turn to a more self-supporting state, with less dependence on the Dandi for grain crops; and agricultural techniques, both in tillage and stock, are being learnt from the Dandi and from Europeans. 778 [334] [241] [293] [648]

Both sexes work in the cultivated plots (indawa), and are helped by children, who weed the crops, herd the stock, and milk the cows. The crops grown or grazed are sheatter (sheatter cassava, called amali in Swahili) and maize; millet and tobacco are still bought from the Dandi, from whom the Dundee also get sheatter and maize seed when necessary. Unlike the distribution of the force into hunting areas, people cultivate the ground close to their own houses, and a group 241 [660] [567] [838] 241 419 [842]

[illegible] (Bateleur Eagle) [illegible] [illegible] [illegible]

/7/

In three mighty surges that followed one another at long intervals, the Ideal people came from the north down toward the equator. The long separation from one another in space and time, their different length of residence in the new East African homeland, and the different shaping of their fate conditioned by that make them appear to us today as three branches of the Ideal people.

The remnants of the earliest immigrant host are the Ank, commonly known under the cover of Wandorobbo /Wandorobbo/ (= Swahi formation from the Ideal word El dandee ; the poor), of whom they form only a part.

Although the traditions of the Ank has nothing to say about a former possession of livestock, one must nevertheless assume, especially on the basis of their ethnography, that they immigrated as cattle-raising nomads and, as such, took possession of large parts of the steppes. Wars among themselves, livestock epidemics, and, finally, the pressure by the Tonga weakened the Ank to such an extent that it was easy for the second host of Ideal, the El Kunh, the first sections of which were the El Lumbwa, and the last ones the El Ongili, where it came to, to drive out the ruined Ank altogether. A part of them found refuge among the neighboring agriculturists, with whom they merged, another part among their oppressors, who adopted them as members of the tribe; the rest, however, withdrew into the forests and bush of the steppes, where still today, in great poverty, they scrape a poor living by hunting.

The fate of the Ank, however, was not to be spared the El Kunh either. After a rather long period during which they cooperated with the Tonga for dominion in the steppes, the Kinlenjok opponent again several times and, as before, brought poverty and death. And again, as before, the ear existences did not remain alone. The third host, the El Kalenjok (Eng. of Kalenjok's, immigrated here from the north, and it looked as though it would rapidly complete, by means of bloody fighting, the destructive work of the epidemics. But the presence of the Tonga, who in places were just as powerful as they were feared, divested the belligerency of the Ideal. They joined the El Kunh for the common fight against the former.

/10 cont./
eyes are almond-shaped, straight or somewhat slanted. The nose is extended, narrow, and, at the root, [illegible] deep-set compared to the forehead. Its alae are narrow and very fine, the nostrils roundish to longitudinally oval, less often transversely oval. The bridge of the nose straight, sometimes slightly convex. The lips are full, without showing actually protruding. Protruding, thick lips are something more and striking that they can then cover the same labelish — lack lip (or actually: upper, less noted). The ears are small, except for the hypertrophic of the upper edge of the ear and ear lobes owed by the wearing of heavy ornaments. The hair is evenly scattered over the scalp, which is more closely down on recent-shaved heads. The hair often appears "ruby," but this is artificially produced. Only at a length of from one to three centimeters does it curl slightly and /11/ almost never becomes completely curly. The arms and especially the legs are very long, the ones thin, hands and feet, especially among female individuals, small, narrow, and delicate, the fingers are slender and often relatively long and narrow, the fingernails long, narrow, and slightly vaulted.

Even if the racial peculiarity of a three branches were to be traced anthropologically, one can [illegible] an even closer connection ethnographically, which are lead to the conclusion that all three belong to the same people. The difference in their principal occupations, to be sure, seem at /11. I appear here/ [illegible] to indicate a deep division. As has already been pointed out above, however, one can only explain these differences by the [illegible] behavior of a people of similar customs and habits under [illegible] circumstances. The [illegible] to each other, based on the supposition a great deal, and the economic life necessarily [illegible] are also common. While the Woodwards had to endure it when the [illegible] fell victim to epidemics and acts of the enemy tribes, the Lenni, under pressure from the still [illegible] Iroquois, had to flee from the open prairie to their residences in the mountains. The Mohawk persevered

Ill. 6. Young Ibibio. 9 and 4 pure-Ibibios, 9 mixed with Negro blood, 1 doubtful.

The Ibibio's privileged

[illegible] Even though, in general, one should be very careful in ethnology about drawing conclusions from linguistic bases, a certain permissible bow, on behalf of the three branches belonging to our people, to point to their language as well.

As a matter of fact, we find the same language among the Ibibio and Vrihoeli, with the insignificant [illegible] for the latter, with the great number of Ibibio dialects, sometimes this one, sometimes that one is their own, according to the location of their area. Likewise the very widely ranging Ibibio probably understand almost all the dialects. In addition, for the Vrihoeli, in general, according to the degree of their mixture with Negro tribes, a language of the latter's is more or less familiar. Of the Wouberdike, the [illegible] generals speak only the language of the Ibibio, whereas the [illegible] and

...that was done by both the female and female, and if there are no wills in the bridegroom's settlement it must be governed from somewhere else. Marriage is gradual.

Marriage with Kwoli

Eighteen marriages were recorded in genealogies between Dundee and Kwoli or members of the Kwoli group:

Dundee and Kwoli women: 9	Dundee and Kwoli men: 9
Dundee and Kwoli women: 1	Dundee and Kwoli men: 1
Dundee and Kwoli women: 1	

Marriage of Dundee women to outsiders seems to be due to the poverty of the Dundee, which in many cases would have meant that the women would have remained unmarried, such marriages also mean the accession of work to the Dundee.

Polygamy

Although there is no objection to polygamy, Dundee seldom have the means of supporting more than one wife at a time, though several men accounted of re-marriage after a wife's death or desertion. In one genealogy a woman had no less than four successive husbands, some of them her husband's brothers, and her only issue was one daughter.

Re-marriage of Widows

Unlike the Kwoli, the Dundee recognize the re-marriage of widows in the normal manner on payment of bridewealth to their fathers, brothers, or other representatives, i.e. levirate, sororate. Widows normally live with their husband's brothers, return to their parents, or else live alone.

Divorce

Divorce is rare, and is of one kind only—permanent. The husband can claim the return of the bridewealth. But a wife who has borne a child cannot be divorced for any cause whatsoever.

Birth

Intercourse between husband and wife stops at the fourth or fifth month of pregnancy, and is not resumed till the child is about six months old. Birth takes place in the husband's hut, the husband going to live elsewhere nearby. The wife is attended by a midwife, sometimes, and her mother is present if possible. She stays in the hut for six or seven days after the birth, and the child's body must be kept covered for several weeks, only the father being allowed to see only its face. The mother must be guarded by her husband, who kills a goat (which he must acquire somehow if he has none of his own) and rubs the fat and undigested grass which comes from the stomach on her face, breasts, and belly. Children are weaned at the age of about a year. Twins are not liked, and the mother's ritual carelessness caused by their birth must be countered by the killing of a goat which is eaten by the mother and her women friends. The Dundee say that if a man has set a trap in the bush where his wife bears twins, the trap will never again catch an animal.

Children receive their first names, the ninth name, soon after birth, as among the Kwoli, but name is not used, but links the child with a preceding spirit. The second or principal name is given before the child can walk, at the time when it is first given solid food, and is called "porridge name," in imitation of the Kwoli custom. Children may also be given nicknames which often refer to some physical peculiarity. After circumcision, boys become men, and all others were taking their

FLA Dorobo FLA

411 through use and continuous contact with hands and bodies
[384] which are frequently anointed with *Ol-Adeia*.[1]

The bowstring (*ewet*) is made from the sinew embedded in the dorsal muscles of an ox, eland, greater kudu or hartebeest. Occasionally it may be manufactured from the tendon of a giraffe's leg.

[337]

[415] The quiver (*mentiet*)[2] is a cylinder of ox-, eland- or kudu-skin about two-and-a-half feet in length and capable of containing from fifteen to thirty arrows. A strap runs down one side and is attached to the removable cap. When this cap is put on, the strap, taut over the wearer's shoulder, keeps it in place. The quiver is the same in all respects as that used by the Masai, and an illustration of it will be found on p. [illegible] of *The Masai; their Language and Folklore* (Hobley).

The arrows (*kiliik*; sing. *kiit*) vary in length according to the size of the owner. They are generally between twenty and thirty inches long. Many kinds of wood are used for the making of the arrow-shaft (*mediendet*). The arrow-head (*ntipiliit*), which is made from any scraps of iron that can be obtained (since the decline of the *Il-Kwaiso*),[3] no iron is smelted in Tanganyika Mandated, and swords and spears are made, almost exclusively, by the Chaga and the Wanguni, consists of a single barb. The hole bored in the shaft to receive it is reinforced with sinew (*Mdeiet*) from the leg of an ox. This is bound round the aperture, and then the work is smeared with a kind of gum (*iit*) obtained from the *Spirostachys*[4] tree. The arrow-feathers are those of the vulture (*Aretchet*) or the long-legged insect-eating bird called *Endorobi*. The feathers are bound to the shaft with thin gut and the whole (including the nock) is then coated with a sticky paste obtained by chewing a tuber (*nikitiit*). This paste is smeared on and allowed to dry in the sun, when the result is surprisingly strong and well-knit.

[531] Dorobo arrows are workmanlike and extremely strong, but they are seldom if ever embellished or ornamented in any way.

The arrow-head is generally (when coated with lumb poison)

Powers

[illegible] a child is born, the spirit of an ancestor is called upon, and the child carries the name of that ancestor, which is usually throughout his life.[1] [illegible] ability, a new feminine [illegible] power. "Son of [illegible]" [illegible] Ogre, whose father's name is Ghostlight, becomes Ogre-[illegible]Ghostlight, and is known as Ogre Ghostlight. Both his ancestors and friends [illegible] Death.

Characteristics (Roll 1d4)

The [illegible] associated with characteristics [illegible] is the very ability to [illegible] the Death. [illegible] are remembered as [illegible] of [illegible] [illegible] [illegible]

[illegible] The year was divided, from the hunting point of view, into the dry season and the wet season. In the wet season people did not generally go out hunting, but stayed at home and ate crops to which [illegible] and the like. In the dry season they hunted all sorts of game with bow and arrow in the forest and the uplands. Then, long Rhino told of how once after he had been circumcised he was one of a hunting party that went into Kwale Kwali, as far as the hills Kapenga and Tupeakwa,* were the southern Turks, some forty miles from the forest, in the days when there were no Europeans there, and another Dondo spoke of hunting monkeys on the trees below on Kapiyeri in Kwale Kwali. Leopard, monkey, and pig are still plentiful. Buffalo still exist in the vast, in the direction of Tsetsemo and Lumbwa, but they have not been hunted by the Dondo in recent years, in fact, they say, not since about 1900 when the Kapitale age were warriors. Elephant are no more, but they were found in this area, according to some old men, when the Turks and Kipkelonyi were warriors about 40 to 50 years ago. There are no lion in the forest, but the Dondo occasionally shot them in the plains. Leopard used to be hunted by organised parties, but this practice has been discontinued for some years, though they are still attacked and killed by individuals if they get aggressive, as in February 1935, when long fingers got his leg torn by a leopard [illegible] at Kwanjiya. Sometimes traps are made for them, of one which is pictured up on the forest. But trapping leopard is not common, and the trap made by long fingers which caught a leopard in July 1936 was said to be exceptional. Generally they prefer to hunt a leopard with dogs, as in the old days, when [illegible] it was very good sly for a dog and climbed a tree, the hunters came and shot it.

[illegible] There is really no close season, as we understand the expression. The trapping season, which did in fact give the game a respite, was not intended for that purpose, but was for the convenience of the hunters themselves, because when it is wet, the forest is difficult to go through, the undergrowth thick, and the ground muddy and slippery. Though some have been known to hunt pig there in wet weather.

[illegible] Dondo hunting equipment consisted of a bow, poisoned arrows, spears, nets, and dogs. Spears have never been used by the Kipkelonyik, and the game may respond to the hunter among some Dondo have not appear ever to have been one of their methods of killing big game. For trapping a man sets only something to run the poisoned arrow, part, of course, the shaft. It is to a stake, a gin-trap, he sets something to dig with.

Bows are made mainly from the forest tree [illegible] and are about 5 ft. in length. A suitable piece of wood is cut and scraped with a knife-blade till it is smooth and of the right thickness. The bow-string, [illegible] is made of gut from the green sky snake. The gut is scraped, greased and twisted till it becomes sufficiently strong and pliable for use. It is knotted to the ends of the bow as both as in from each end. as which is cut to the exact is shown in [illegible]. Arrow-shafts are made from the [illegible] and reeds, as well as from [illegible] bamboo. They are smoothed with a knife-blade to the same way as

* Kenya Colony, A. Kongoleni, A. Kitabisa and Kapiyeri.

They are still in the very prolific laying Swallow of eight to ten children, but the labor necessity is so constantly heavy that their endless tension very shortly ; this necessity is probably due to the only three offspring of the Mini Friends, which are at only attitude weighing from 1,200 to 1,500 feet.

Their given consisting consists of setting off a high wire, and the commanding gentles they spoken are another with the World.

They live principally on Fishes and other seafoods, which they share to the Ocean for certain existing functions they go and have big gates on the global forms on the Seagate Guard ; they work till the grass is dry and they turn it to Southern Asia hunting. They are pleased across the big grass and experienced over the seafoods, they have huge to come to their hunting and are very keen to get young legs for their gestures. They will so that they give the big certain continuity with the utmost credit than most gates.

They are very more digitized humans, and informed we that when they consist across as elephant they were off and turned out another characters very certainly will appear all sizes of the human eyes, and that they were then able to appreciate a straight elephant and speak to with a grotesque form.

They are best expert to the sea of a Scandal. The fire is produced to the ordinary city by the Society of sea with open exact continuity to a dependent to another place of cruel, which is said they borrows the town law of the speech ; the town glass of exact opponent is to the position of fire.

A exact translation of their language is appended on the opposite page. They are the Exact community.

The gentle [illegible] and the uniform [illegible] and [illegible] are, I think, brought to from the Exact language, the many of the work will be found to be quite different. Many of the wife are also again. Exact can show obtaining this resolution to more exact they appeared to have forgotten the Egyptian a Vessel, and the gave the Exact work and left to search among characters who as to many from by the people many. The language is that a violently foraging has with these fish it will gradually formed gates ambient to the new forms.

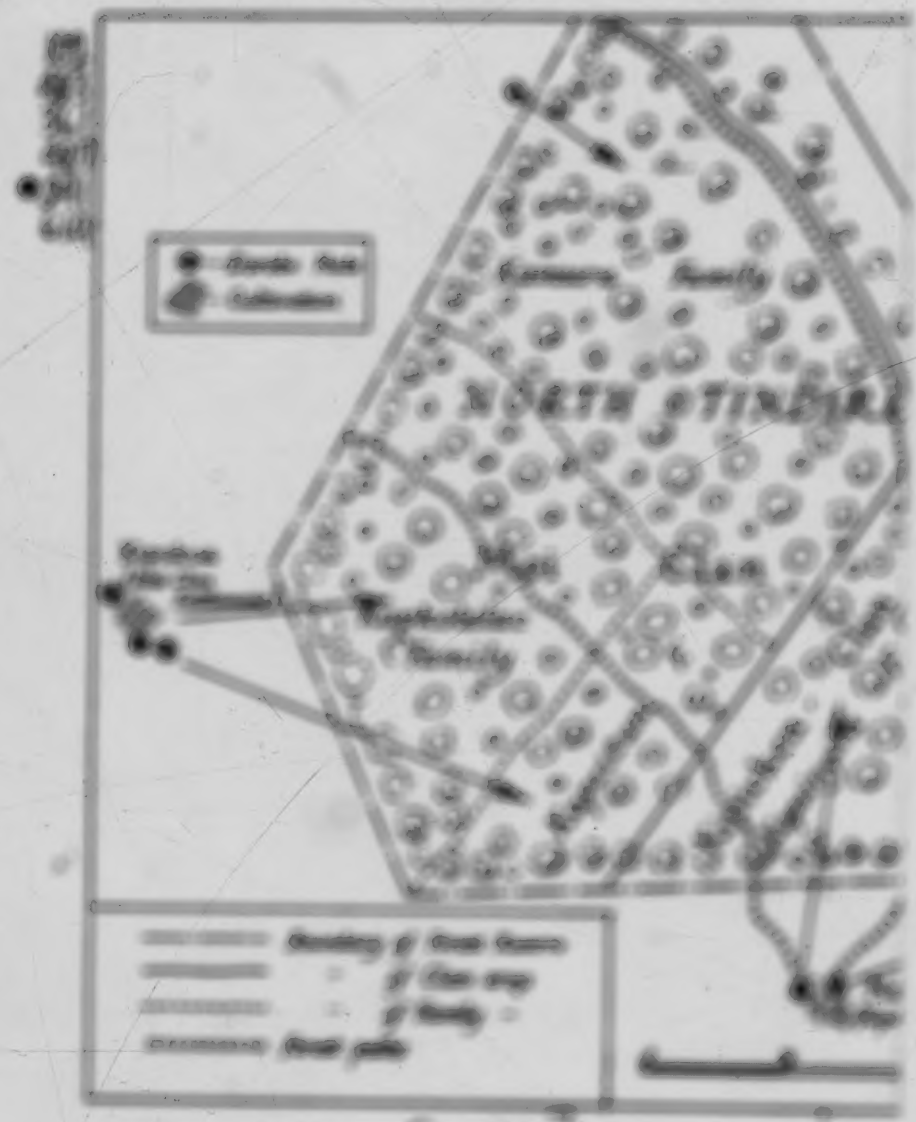
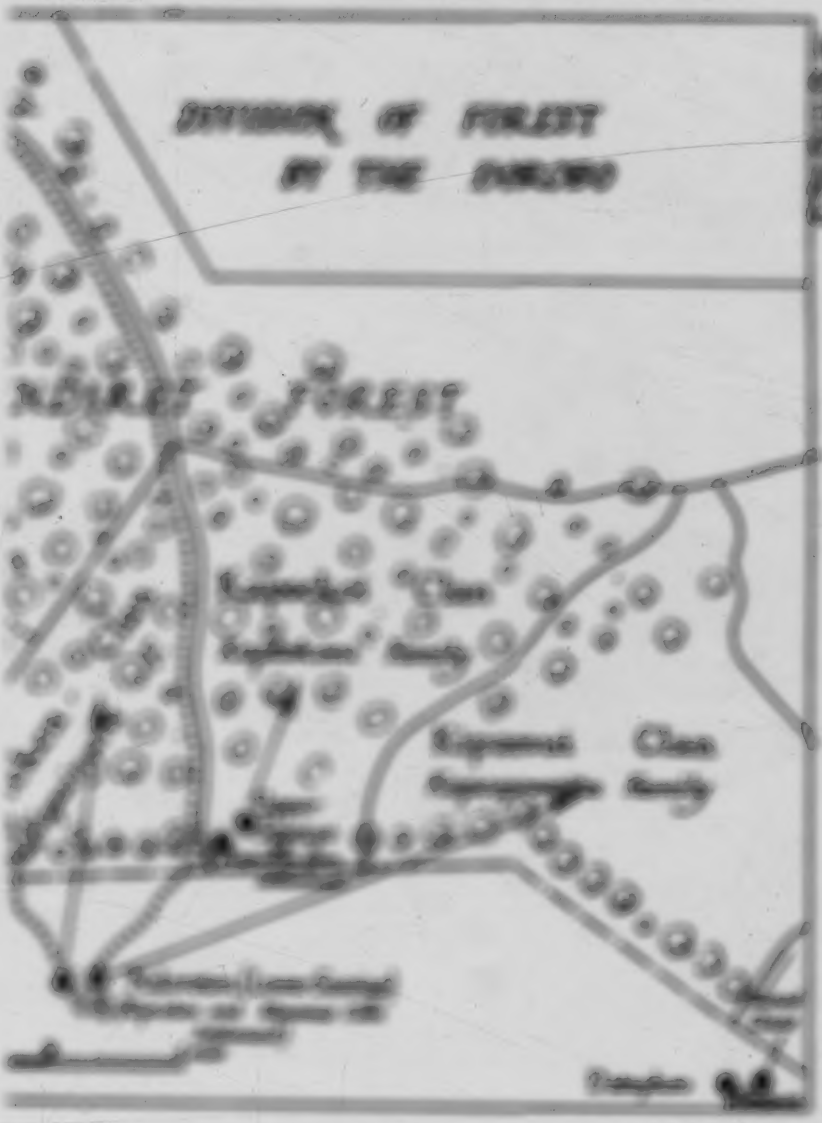
(950) Clothing and ornaments. — Cloth materials. — The individual articles of clothing and ornaments, compared with those of the Ainos. — Head and body hair. — Nails. — Painting. — Tattooing.

[illegible] Cloth materials, such as are the needs of the coarser people in the barter trade, have been adopted only to an extremely slight extent among the Ainu. The principal reason for this is that they only rarely come into direct contact with the new-comers either, while presents from the Ainos, [illegible] they are forced to deliver to them their yield in elephant teeth, hippopotamus teeth, and bone of [illegible] do a small compensation. There is no question of a legal barter trade; the Ainos buy [illegible] with force, as the coastal people in split designate this type of trade.

[illegible] One therefore sees the Ainu drawn solely in their original native clothing. Male women are bodies, [illegible] which, in no sex manner of wear, is observed with that of the Ainos, but quite [illegible] often appear. This covers a pear-shaped [illegible] for the front and rear apron, called [illegible] and an [illegible] to the Ainos, which the Orochonkes name the same, and which here are also worn by older men because in having the [illegible] is no inconvenience because of its length. The [illegible] otherwise to all generally wear the [illegible] called [illegible] also as an [illegible] made of red cloth, which they buy from the Ainos; older men often have it made out of the cloth of the Amoor black-tailed [illegible]. The [illegible] of the women is two-sided [illegible], as to the upper part of it [illegible] of the Ainos to wear, while the lower one is worn after the Ainos fashion of [illegible]. The [illegible] is narrow, is two-sided [illegible] and is considerably [illegible] than the former, only a little longer than the [illegible]. Instead [illegible] worn them of [illegible], which, however, is [illegible] not met with. To [illegible] the poverty of the Ainu it [illegible] among the [illegible], though one must also consider the fact there seem to have a [illegible] as to [illegible] of inconvenience, very considerably [illegible]



[p. 96]



[p.67]

[illegible] duration of which is in inverse ratio to its inaffectiveness and the severity of the cold's impact.

[illegible] The Maasi are good to the D'Aviro and seldom refuse them a share in whatever food is obtainable. Be it milk, meat or grain. The D'Aviro expect this; in fact, many of them seem to look on the visitors from the Maasi as their right. The reason for this is stated to be that the D'Aviro helped the Maasi on many occasions in the past (particularly during the great widespread epidemic in the early 'nineties) by looking for them after starvation had overtaken the ingredient antipathy of the Maasi to visitors. In addition, before the coming of European rule many elephants were killed by the D'Aviro at the request of the Maasi. Lobito told me of one drive in which he and about thirty D'Aviro were engaged during which sixteen elephants were killed.

[illegible] When a D'Aviro's daughter wants to wed, unless restrained by the more prudent friends, he slaughters and eat them to the shortest possible time. Up to quite recently a bond was valued by the D'Aviro only for the amount of meat it was capable of providing, but nowadays a few of them are beginning to look upon it in a small way and even over live as Maasi. It is interesting to note that many of the older generation, particularly the women, profess an aversion to having cattle in the vicinity of their own dwelling or sleeping places.

[illegible] • [illegible] A few D'Aviro still do hunt, but in a half-hearted way. They are extremely improvident and prefer to risk almost inevitable hunger rather than to exert themselves in cultivating grain. They never expect their women to work in such small plots. Areas as they may have. A D'Aviro will cheerfully marry his [illegible] food for a week or more, picking up a most precarious subsistence [illegible] on roots and roots, and will consider himself well repaid if he returns with a few pounds of honey. He will be horrified at the idea of getting to see boy's work each day on a specific patch for the same length of time.

[illegible] To the Dorobo, very little in the way of food comes amiss to the D'Aviro. Failing meat, his favourite food is honey, but this is regarded as a delicacy and would be eaten wholesale only under the most exceptional circumstances. If meat and honey are unobtainable, the D'Aviro has at his command an extensive

[illegible] [illegible]

help his wife to bring up his children, continuing her claim on him in affection which outlasts childhood into old age.

My chief friend and informant among the Dorobo, Kimnyo arap Mining, or Ol[illegible], during the period of my field-work, at Kipsikon, with his mother Cheborbor, and his family consisted of the following:

Cheborbor ♀

♂ Arap Mining — Cepkemoren ♀

♂ Kipsiroi | ♂ Kipsikon | ♀ Chesigit | Chesir ♀ | girl, not yet named, born 2 Dec 1938.

In July 1938 he was living in a flat-topped hut in the middle of his section of the settlement; but by December of the same year he had moved to a new hut with a pointed roof outside the *sheenka*. His mother's hut was about 100 yards away at the other end of the *sheenka*. His three boys all [illegible] ages, he himself being a *Tyongi* ranged from about four years old upwards, and Chesir, the elder girl, was about seven. At this time he slept in the back part of the hut, the *ware*, where his goats are kept at night, and his wife slept with the children in the front part, the *kwina*. This was because she was suckling a baby. Strictly, Arap Mining should have gone to sleep in another hut, but since this was not possible for several reasons, the wall dividing the *ware* from the *kwina* was allowed to make the new round as a separate hut (the original type of Dorobo hut has no partition at all).

One day I arrived rather early and found that Cepkemoren had gone across the valley to get a new water-pot, leaving Arap Mining in charge of the children. Mzee looked after the baby, but still he found his responsibilities rather a heavy burden, and was glad when his wife returned a little before noon. Cepkemoren fed the baby, sent the children indoors to rest, and went down to the river to wash. At this hour, when there is no particular work to be done, the elder people sleep. On some days Cenkirikat comes to Arap Mining's *sheenka* to help with the cultivation: Cepkemoren normally works there too, but not every day while the baby is so young. When she does go, Arap Mining goes with her, and the baby is left with Mzee. But the *sheenka* is not so far away that Cepkemoren cannot hear the children if anything goes wrong.

The Dorobo elementary family might thus seem to be independent and self-contained. But it is not so really, and other relatives have a share in the upbringing of the children, not in spite of the parents' authority, but in support of it, and the relative who must be considered next to the parents from the Dorobo point of view is the father's brother, *papa*, who often lives in the same settlement, or if not, only a short distance away. This person, especially when he is an elder brother, has a position of authority over his brother's children at least equal to that of their father. His wife, a classi-

4:Huntingford E-5 (1938-1939) 1953 FLA Dorobo FLA

436 1 bundle of tobacco (about 1 lb.) for 1 kuglul of honey.
1 large earthenware pot for 1 large prepared antelope skin.
1 small earthenware pot for 1 small prepared antelope skin.
2 baskets of cereal seed for 1 basket (kuglul).
1/- worth of trade beads for 1 gourd full of honey.

[804] The kug used as a measure for honey is the smaller size of kuglul, measuring 7 or 8 ins. by 6 ½ or 7 ins. The gourd is about 10 ins. long. The large pot stands about 20 ins. high, the small, about 10 ins., and the large antelope skin is usually a bushbuck, the small one a duiker.

487 There are no special market places or places of exchange. The Dorobo
437 go to the nearest smith or potter and make a bargain, returning later with
[443] the exchange equivalent to collect the goods. There is no language difficulty
[197] in these transactions, for the Dorobo language is no more than an easily understood dialect of Nandi. Getting iron or pottery means going into the Reserve, but to get seeds, tobacco or beads they need only go to the nearest friendly Nandi who has what they want and is willing to make the exchange. Sometimes plant material of medicinal value (i. e. what they think is medicinal value) is substituted for some of the regular exchange articles, but the above list represents the ordinary practice. When Dorobo have money with which to buy what they want instead of exchanging goods, they have the choice of going to the shops at either Songhor in the south, or else at Aroan in the Nandi Reserve, where there is a collection of Indian shops. The men do not
[562] like their womenfolk to go to these places unescorted, but occasionally some of the bolder ones try to slip away undetected to Aroan; they seldom go to Songhor, as it is in the European area.

476 No human group can exist without some form of co-operation, and even when a man lives alone, as he may have to among the Dorobo, he is not because of that cut off from or unable to share in the activities of his fellows. Within the family people are interdependent, and in the settlement they help each other. The main activities in which people normally co-operate are four in number: 1. House-building; 2. Hunting; 3. Digging earth; 4. Cultivation.
[462] (1) Building huts is women's work, which a man will do if he has no wife, and
[224] for which he will get help from a relative or clansfellow. (2) When people hunted game they usually went out in parties, and the kill was shared among
[317] them. (3) Digging earth means a journey of anything up to 10 miles round the edge of the forest and into country where nowadays there are strangers, so people find it both safer and more convenient to go in parties, for though they are in no danger of being attacked, their unconquerable shyness demands numbers to give
● [241] confidence. (4) In a family or clan group, though each individual has his own shamba, he will expect both to help and to be helped by the other members.

[276] Together with the spirit of co-operation is the rule of joint consumption. We have already seen how meat is shared according to definite rules; and among the Dorobo certain other things which are hard to come by must also be shared. The chief of these is tobacco, of which when a man has acquired even a small supply, he is supposed to give some to his father, to his wife's

Fig. 6. A Simple Kind of Sponge
This trap has an "trigger-peg". The animal treads on the platform and by so doing presses it against the upright A to which bone B is pivoted, thus releasing the bone and allowing its free end, B to spring upright and tighten the sinew round the neck of the quarry.

when an animal treads on A, allowing the bone to slip over the top and free either the bone ends B.

Hunting parties might be made up by as many as eight men, though I think that probably four or five was a more usual number. A common practice was for half the party to work along one bank of a stream and the rest along the other bank, so that if there was nothing on one side, those on the other side might be more successful; or if the quarry got across the stream, the men on the other side would be able to deal with it. When a kill was made, all the hunters assembled. The animal was skinned, the meat cut up, and some of it eaten on the spot, either raw, or partly cooked by laying it across a rough wooden framework over a fire. The rest of the meat was divided among them and taken home. In the best days, when meat was plentiful, what was left over was dried and kept either as a reserve or else exchanged with the Nunā for sinews and antler. A stack of dried meat (embracing about 2 ft. square, was said to obtain 20 lbs. of grass. Meat is cut into strips (or, whence evidenced) which are laid out on the drying rack or left over the fire to be smoke-cured after being dried on the roof of a hut or in the bark of a tree.

c) Agriculture

Since they can no longer hunt, and present conditions are * not favourable for the acquisition of cattle on a large scale (even if the Eskimo had the means of so doing), the adoption of agriculture has become an economic necessity, and methods, implements, and seed have been obtained from the Nunā. This change from hunting to agriculture has taken place virtually between the years 1927 and 1930. In the first of these years the area cultivated by them was so small as to be negligible; but by the latter year their lives were, as we have seen, to a great deal centered on agriculture. And as with hunting in the old days, so with agriculture to-day, the growing of crops is naturally regulated by the wet and dry seasons and the main divisions of the agricultural year are:

January to April:	preparation of the land.
April-May:	planting.
September:	reaping.

* This refers to the years 1928-30.

Fig. 1. Plan of a Kwoma village, a Cargo cult in North Wosera.

a Kwoma is still his own way as much developed by mythical ideas and a set of rules called Nyaiwa. Now the original Nyaiwa but to be given up and his evangelical faith by men and especially great importance. Nyaiwa has a Nyaiwa of to himself. Each story however, several people divide the story begin a town, and corresponding to the values of Nyaiwa and in some cases Nyaiwa does part of a Nyaiwa Nyaiwa and Nyaiwa (Fig. 1).

Though not connected with cultivation, no one, however low his religion of with Nyaiwa, however it is concerned with his growth. But just when cycle a Nyaiwa and Yambaiwa (or Yambaiwa, as his Nyaiwa call it), and now go to gardens at last on this to Nyaiwa. They are nothing but a Nyaiwa work, Nyaiwa south of a Nyaiwa[illegible] work, and the cycle is carried Nyaiwa a Nyaiwa Nyaiwa. To harvest Nyaiwa when other Nyaiwa Nyaiwa to the cycle, proclaiming only a Nyaiwa party Nyaiwa will have to Nyaiwa from the Nyaiwa who inspired even that Nyaiwa of Nyaiwa, and Nyaiwa as the Nyaiwa to have Nyaiwa part. It is said that if a man Nyaiwa refuse the Nyaiwa, the party Nyaiwa go home without Nyaiwa. But as no Nyaiwa ever has Nyaiwa, the Nyaiwa are to continue. Finally the Nyaiwa will Nyaiwa work to the Nyaiwa, who pay them in the sum of a Nyaiwa for a Nyaiwa Nyaiwa of Nyaiwa. But Nyaiwa, Nyaiwa is not Nyaiwa with his pre-eminence Nyaiwa off for Nyaiwa as the Nyaiwa, which Nyaiwa, Nyaiwa, is Nyaiwa as a Nyaiwa Nyaiwa to Nyaiwa of Nyaiwa.

[illegible]

If the Nyaiwa had ever been in such Nyaiwa Nyaiwa with a people whose primary interest in life was Nyaiwa, it is possible that they would have succeeded Nyaiwa Nyaiwa with agriculture and active work. But their Nyaiwa with the Nyaiwa have inevitably led them to take an interest in Nyaiwa, and to think that the possession of Nyaiwa is a desirable thing. Therefore they are slowly trying to acquire Nyaiwa, and are in process of making them their ultimate objective. But

[P. 196, A]

Economic life to-day is centred more and more on the *imbaret* than on hunting. 241 423

The family group is interdependent: the men trap, make tools, protect the family; the women look after house and children, and prepare food; the children, while dependent on their parents for existence, help them with the *imbaret* and live-stock, and in various other small ways. 592

There is little specialization, since all men can make traps and honey-barrels, and all women can make baskets. Joint-production occurs in (1) house-building, when the whole family takes part; (2) cultivation; (3) in hunting and in digging coloured earth. Food produced by the family is shared by husband, wife, and children, and also by the husband's and the wife's parents. Meat caught by trapping is divided between the trapper's family and the other people living in the settlement. Vegetable foods are not shared thus, since they can be got by all. Hospitality is given to visiting relatives, clansmen, age-mates (though they do not sleep with their host's wife), and even to stray travellers, once their good faith is established. Beer is drunk at social gatherings of men or women, at clan councils, and on ceremonial occasions. And just as meat is distributed in a particular way (p. 193), so with tobacco: a man who acquires some gives it first to his father, then to his wife's father, and lastly to his brothers and clansmen, if it will go as far. [402] [342] [241] [224] 592 421 [224] [244] 574 273 276 [431]

The typical Dorobo hut, *kochogget*, is extremely simple, being no more than a framework of sticks covered with leaves, and a hide on top. They are now building larger and better huts of Nandi type, sometimes with unplastered walls; and an intermediate form may be seen, with a nearly flat roof. 342 [177]

D. THE MAGICO-RELIGIOUS ASPECT OF ECONOMIC

That the Dorobo had hunting magic is certain: old men say that some had it, while others had none; my friend Arap Misiy, for example, says he was one of those who had none. Since hunting is the one phase of Dorobo life that appears to be gone for ever as a result of government action (in spite of sporadic individual activities), this important aspect is, I fear, irrecoverable. 224 [178] [148]

l: Huntingford E-4, 5 (1938-1939) 1953 FLó Dorobo FLó

Agriculture

The Dorobo began to cultivate in a small way about 30 years ago (or even a little earlier) and at first they grew only eleusine. Though their inclinations were to become cattle-owners, conditions were unfavourable to the development of cattle-breeding as a primary activity and they have been forced to make agriculture a serious business; for the methods, implements, and even the seed used in this, they have been indebted to the Nandi.

Land

Those who live in A and B domicile categories (with whom alone we are concerned here) cultivate small plots in the open land which surrounds the forest. They have no rights of tenure, except the temporary ones acquired, according to Kenya law, if they live there as squatters under the Resident Native Labourers Ordinance. Their plots, *imbaret*, pl. *imbaremik*, range in size from one acre divided into four individual holdings, to half an acre divided into four holdings; in other cases, plots of a quarter to one-fifth of an acre worked by one person. All plots are fenced, and sometimes a living-hut is built inside the fenced area; occasionally it was found that elderly Dorobo were allowed by Nandi squatters to have a little piece of their cultivated land to work.

European farmers in the district, with whom the Dorobo land question was discussed, seemed not unwilling to let the Dorobo live unmolested on their land provided they gave no trouble; but the government authorities thought otherwise, and the position of a Dorobo who did not choose to become a squatter in order to live on what he considered his own land was thus precarious.

Cultivation Methods and Crops

Two main crops are grown, eleusine, *paiek*, and maize, *ipandek*. Millet had not been grown by 1940, though they bought it from the Nandi. Sweet potatoes, *ropoonik*, are sometimes grown in very limited quantities. Implements are the heart-shaped hoe and the panga or cutlass, both obtained from the Nandi. They have also small axes, *ndolut*, and knives, *rotuet* or *cambolust*.

The growing of crops is regulated by the dry and wet seasons, *muainonik*, from October to March, and *iuotet*, from April to September. The land is prepared between January and April, and planted in April or May according to the rain. Cultivation follows the Nandi method, with paring and burning of new land. The seed of eleusine and maize is bought from the Nandi, usually from squatters living nearby. Maize and eleusine are planted together in the same plot, though potatoes are generally grown separately. Eleusine is reaped in the Nandi manner by cutting off the heads; maize is picked by hand. Granaries of Nandi type are sometimes made, but are seldom needed, as the yields are so small that the loft of a hut can generally hold all that is not eaten on the field (as is often the case with maize). Cereals are roughly ground on slabs of granite in the Nandi manner.

Food

Food in the old days consisted mainly of meat supplemented by honey, wild vegetables, and grain bought by exchange from the Nandi. The food supply is now based on their own agricultural produce, supplemented by milk when they have any, and by certain other foods when they can be got. Meat is still obtained by trapping, though seldom by hunting; it includes the flesh of antelopes, monkeys, pigs, and leopards. Honey is got, as already described, from honey-barrels. Wild food, collected in the forest, includes fruit of the *momoniat* (*rubus rigidus*), *lemeiyuet* (*xymonia americana*), and *sasuriet* (*musa ensete*, wild banana), the sap of the *sasuria* and leaves of nettle, *siuot*.

Intoxicating drink is of two kinds: the Dorobo honey-wine, *kiphetinik* or *kumik ap lo*, made from honey, and fermented with the long seed-pods of the "sausage

3:Huntingford E-5 (1921-1928)1929 FL6 Dorobo FL6

II.—Mode of Subsistence.

Houses.

342 [361] The Dorôbo live in little shelters or huts (*kochonget*, pl. *kochongwiek*; N. *kwiet*) built in small clearings in the forest; they are made of a framework of sticks stuck in the ground, and bent over, forming a domed roof; the whole is covered on the outside with leaves of trees and banana leaves, which are insufficient, in spite of the addition of an ox-hide on the top, to keep the hut dry inside when it rains. The upright sticks are strengthened by others tied across them with tree-rope. The huts are oblong, with rounded ends, and are of the following average dimensions:—Height, 5 ft. 10 ins.; width, 7 ft. 6 ins.; length, 11 ft. They are occupied for two or three months, after which they become ruinous and "full of fleas," when the [590] family moves to a fresh site. Two to four people live in one hut. One group of huts we saw contained two huts, and had contained a third which had been pulled down. The huts are divided into two parts, the sleeping-place (*itôkto*, N.) and the [353] fire-place, which are separated by two or three poles laid across the floor of the hut, on one side of which are laid ox-hides (*muûsik*; N. *muiuak*), upon which the occupants [513] eat and sleep; at night they cover themselves with skins. In the other half of the hut is the door (*kurkut*, N.), about 2 ft. high. Some huts have two doors, opposite [354] each other. Between the door and the sleeping-place is the hearth (*mêit*, N.), consisting of two or three smallish stones set on the floor. A loft (*saimet*, N.) is sometimes made in this part of the hut, extending across the width, and ending at the beginning of the sleeping-place. The loft is about 2 ft. 6 ins. above the floor, and [251] is made of thin sticks supported on thicker cross-sticks, and tied together with [372] tree-rope. Upon it are kept firewood and eleusine grain (Text-figs. 26–28). The [412] only household utensils are a small broom (*sôtutiet*) about 14 ins. long, made of [415] a bush-buck's tail fastened to a thin wooden handle, for sweeping the floor; "water jars" (*soiyet*) made of a hollowed piece of bamboo about 2½ ins. wide and 2 ft. 8 ins. long; a grindstone (*litêto*, N.) made of granite, for sharpening knives, [439] and for grinding eleusine grain. Gourds and earthenware pots are obtained from the Nandi; the Dorôbo have no stools. Fire is produced by means of fire-sticks (*piinet*; N. *piônet*) (Text-figs. 11*a*, 11*b*). A thin stick of the choruet tree (N.),[1] about 15 ins. 372 long and ½ in. thick, is stood upright on a stick of cedar (*teet*)[2] about 26 ins. long and 1 in. wide. The thin stick is called piinet, the cedar stick tasamet. The piinet is held between the palms of the hands, and the hands are rapidly rubbed together, beginning at the top of the piinet and working downwards (Pl. XXVI, Fig. 2). This is repeated until fire is obtained; the piinet drills a hole in the tasamet, and the heated wood-dust thus produced falls on to a knife-blade which is placed underneath. When sufficient heat is obtained it is laid on a small bundle of tinder (*sasyat* (dry grass) or fibre of the porôwet[3] tree), and blown till the tinder kindles.

[1] *Ficus* sp. [2] *Juniperus procera*. [3] *Dombeya* sp.

3:Huntingford E-5 (1921-1928)1929 FL6 Dorobo FL6

prepare food and wait upon the men, themselves eating when the men have finished. At the present day the Dorôbo are taking to eating eleusine grain, which is crushed on grindstones (*liëtto*, N.) and made into a sort of porridge; and milk, which they obtain from Nandi, if there are any near them. Beer is made from honey, and is called *kipketînik* (N.). Tobacco (*tumatet*, N.; or *chepkochûtit*,[1] N.) is bought from the Nandi, and is taken by men, and occasionally by women. It is either chewed (*mit*, N.) or smoked in Kavirondo pipes (*terênik-ap-tumatet*, or *kweînik*, N.), which are also obtained from the Nandi. The men carry tobacco in cylindrical boxes called *kiprawit* (N. *kipnut*) (Text-fig. 22), made from sosoiyat (bamboo), with skin coverings for the ends, to which are attached thin leather thongs, by which the box is slung round the neck.[2]

Agriculture and Stock.

Formerly the Dorôbo possessed no stock, nor did they till the ground. During the last quarter of a century or so a few of those living on the edge of the forest have taken to cultivating small plantations (*imbaret*, N.), in which they grow eleusine grain (*olbaiek*†, or *poiek*; N. *pâk*) only. A few possess, at the present day, one or two cows; others have a few goats and sheep; no one has more than 5 to 10 head. The only animals they possess in numbers are dogs.

Dress and Ornaments.

(i) *Males.*—Boys wear skins of antelopes and monkeys (*akuriet*; N. *inguriet*). Warriors wear skin garments of duiker (*ngemuuyo*,[3] N.) called akuriet; they wear leg-bells attached to a leather band (*mpitiko*,[3] pl. *mpitikoïsiek*) on the ankles. Nowadays some wear pieces of cotton-cloth (*anget*, N.) dyed brown.[3] Old men wear bush-buck skins (*akuriet*) with the fur left on. Caps (*engeraitî*) are worn, of blue duiker skin with the fur left on, by old men, and of cotton-cloth by warriors. Belts (*entoreitî*) of leather are worn by old men, and of beads by boys and warriors. Necklaces of chains (*sirimdo*, N.) or iron-wire (*asingait*, N.) are worn; also various kinds of iron ear-rings (*olaimeriatî* and *kimeitaiit* (Text-figs. 13–17); N. *kimeiteitiot*) are worn by warriors and elders.

(ii) *Females.*—The dress of the women and girls is very similar to that of Nandi women. They wear skirts (*chepkaiyuit*; N. *chepkwit*) and upper garments (*koliket*, N.), both of tanned leather, with the fur removed, in the same manner as the Nandi women. Their ornaments consist of iron-wire armlets and leglets (*makirarênik* and *karik*, N.), and wire necklaces (*asingait*, pl. *asingaïsiek*, N.). Married women wear

[1] *Chepkochutit* means "snuff" in Nandi.

[2] These are similar to the Nandi tobacco-boxes, from which indeed they are probably borrowed.

[3] As do the Nandi, from whom doubtless the custom spread to the Dorôbo.

6:Huntingford E-5 (1938-1939) 1953 FL6 Dorobo FL6

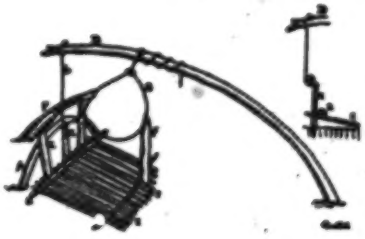

Fig. 5. A Simpler Kind of Springe. This trap has no "trigger-peg". Hunting parties might be made up by as many as eight men, though I think that probably four or five was a more usual number. A common practice was for half the party to work along one bank of a stream and the rest along the other bank, so that if there was nothing on one side, those on the other side might be more successful; or if the quarry got across the stream, the men on the other side would be able to deal with it. When a kill was made, all the hunters assembled. The animal was skinned, the meat cut up, and some of it eaten on the spot, either raw, or partly cooked by laying it across a rough wooden framework over a fire. The rest of the meat was divided among them and taken home. In the best days, when meat was plentiful, what was left over was dried and kept either as a reserve or else exchanged with the Nandi for eleusine and millet. A stack of dried meat (*sirikeniot*) about 2 ft. square, was sold for about 25 lbs. of grain. Meat is cut into strips (*sir*, whence *sirikeniot*) which are laid out on the drying tray or loft over the fire to be smoke-cured after being dried on the roof of a hut or in the fork of a tree.

c) Agriculture

Since they can no longer hunt, and present conditions are[18] not favourable for the acquisition of cattle on a large scale (even if the Dorobo had the means of so doing), the adoption of agriculture has become an economic necessity, and methods, implements, and seed have been obtained from the Nandi. This change from hunting to agriculture has taken place virtually between the years 1927 and 1938. In the first of these years the area cultivated by them was so small as to be negligible; but by the latter year their lives were, as we have seen, to a great deal centered on agriculture. And as with hunting in the old days, so with agriculture to-day, the growing of crops is naturally regulated by the wet and dry seasons and the main divisions of the agricultural year are:

January to April: preparation of the land.
April-May: planting.
September: reaping.

[18] This refers to the years 1938-39.

6:Huntingford E-5 (1938-1939) 1953 FL6 Dorobo FL6

is to get as much as possible of the crop out of the way so that ploughing can start at once without having to wait till the crop is ripe. But the Dorobo had, all the same, made a step forward, for a solid, compact stook is less likely to be devastated by animals than plants standing scattered over a field.

By 25 November, 1938 the Kipukua people had reaped their crops. The shamba here was about an acre in extent, and was divided into four approximately equal-sized plots. There was little maize, for some had been eaten on the field and some had been destroyed by vermin; what was left had been stooked, and anything like an accurate estimate was impossible, though there might have been two or perhaps three bags in the stooks. If we estimate that the equivalent of two bags might have been eaten, and two more destroyed by vermin, we have about 6 or 7 bags, a somewhat high estimate for a crop grown mixed with eleusine, but not impossible[39]. Of eleusine, one plot yielded 3 bags, and another 2 bags (that is 5 bags from half an acre), not a great deal, certainly, but a fair yield under such conditions, and most useful as food, for the Dorobo eat most of their eleusine, and turn very little of it into beer. Maize and eleusine are ground by crushing on slabs of granite (*liteito*), and the resulting meal is made into gruel (*musarek*) for the children, and stiff porridge (*kimiet*) for the older people; it is generally eaten with a mess of vegetable food (*inguek*) prepared separately.

Storage of crops is not yet a very difficult problem. A few of the Dorobo, it is true, have built granaries of Nandi type, hidden just inside the forest to prevent thefts by the Nandi, for anyone can lift up the roof of such a granary in the night. But since so much of the maize is eaten on the field, what is left at harvest time can be stored in the loft; and the same applies to eleusine, for it does not yield a large amount of grain. I saw no millet growing, and the Dorobo said they bought it from the Nandi.

As we have already noted, agricultural labour is divided to a certain extent between the sexes, but the distinction is not very sharp, and it was found to work out in the following way:

Men:	Both:	Women:
Heavy preliminary work	Digging	
Planting	Weeding	Collecting and burning weeds
	Reaping	

The heavy work includes lopping off branches in the Nandi manner, clearing bushes, and breaking up the ground when hard. Women may also plant, but the tendency seems to be for men to do it, though there is no absolute rule against women planting. Children help with the weeding, and herd the goats when there are any; old men herd cattle, and women also sometimes herd goats.

The Dorobo had not by 1939 acquired the Nandi belief that each eleusine crop requires new land, which in the circumstances is just as well; but they do not hesitate to give up using land which is unproductive. Thus,

[39] The bag is the standard 2 ½ lb. gunny bag used in East Africa, holding 200 lbs. of maize.

[P. 194, A]

shares the *imbaret*, each house having its own strip, the whole being surrounded by a thorn fence which all help to make. Each is therefore a family or clan *imbaret*, and the group is an independent labour unit.

The grain crops are stored either in granaries of Nandi type, or else in the loft (*tapet*) of the hut; but as most of the crop is eaten before or soon after it is reaped, and as the yields are not large owing to the small areas planted, storage problems are not yet acute. Further supplies of food are got (1) by purchase or exchange; (2) by begging

241 423 [351] [614] 251 261 [437] [735]

/231 cont./

621 to dobonog, i.e., huts of the unmarried men, in contrast to the
[192] aija to daima, the camp of the married. Therefore here, too, we
[071] find, even in the name, a separation into kraal of the married and kraal of the warriors, similar to the one mentioned for the Masai.

171 The arrangement of the interior of the hut, like the form itself,
353 resembles that of the Masai; its furnishings, however, are even
415 sparser. A honey pot (madjé, madjeog), a gourd bottle (mget) for
237 drinking water and honey beer, a leather bag (lebenu, lebenua)
283 for collecting honey, a larger one (ndaro, ndareraũg) for water, a
352 few earthen pots, larger ones (idug, idia) and smaller ones (ruguba,
412 ruguba) for cooking, a couple of wooden bowls (tagi), a rope cut out of an animal skin (scharu, scháruga) to tie up the slain meat, a cord twisted out of the bark fibers of the baobab (Adansonia digitata) for the drawing up and letting down of the beehives hung in trees (merihgo), along with a few dehaired skins (fulót) that serve as beds, as well as ax (haũo, hauereg) and knife (pandyug), constitute the
492 principal household equipment. In a few huts one also finds the en
412 dereta /pack-holders/ of the Masai, here called lalaho (leleweg),
413 as well as a hammer (giribét) for forging and a chisel for designing
177 the arrow points (mad, mara), and finally that sharpened small piece of sheet iron serving as razor-knife (herá, hereá). The entire family,
592 namely, husband, wife or wives, and the uncircumcised children, live in one /232/ hut. Men and boys, however, are usually out.
512 The day begins even before daybreak for the hunting men. They
[224] set out with a snack consisting of a little piece of boiled or roasted
[264] meat, so that the first light of day already finds them in the hunting
[825] grounds. The game now behaves best; as they say, it then feeds more eagerly and carelessly than a few hours later, when the sun already becomes annoying to it. At daybreak women and children leave the huts; firewood and water are carried up in order to cook
[251] the meat fetched from a larder located in a nearby tree. The meat is kept there and not in the camp, so that it hangs in the air and
512 thus remains fresh longer. After that the morning meal is eaten.
264 Actually the Wandorobo do not have definite mealtimes: as long as there is something edible they simply eat as long as they can.

/232 cont./

262 If lean times then come, one tries, as well as one can, to appease
the stomach with wild roots or tubers, with berries or other small
[252] fruits, with honey and honey beer. Meat is seldom eaten raw,
usually boiled or roasted at the open fire. For storage it is cut into
• 251 long strips that are hung to dry in the sun. When the meat is well
439 dried, it is stowed away in the aforementioned tree, close to the
231 camp; cattle and small livestock, which are bought from the Masai
for ivory, are not kept, but slaughtered immediately. Insofar as the
262 Wandorobo, in barter with sedentary tribes, are able to come into
[439] the possession of vegetables, they also live on these, but actually
only during times when, for some reason, only little game is to be
had. Otherwise the vegetable food acquired by trade constitutes
only a side dish, especially for woman and children. Many of them
[272] detest milk and base this on the fact that their stomachs, accustomed
only to meat diet from early childhood, do not tolerate it. Some
go so far as to throw away the udder of a slaughtered cow, although
[171] they eat that of a slain piece of game. There indeed seems to be no
doubt but that the previously mentioned Masai belief, according to
which milk and meat must not be brought together, rests on these
273 customs. Besides water, honey beer, which they make in the same
[201] way as the Masai, also serves them as a beverage. The latter prize
[171] that made by them more than their own, which probably rests on the
fact that the Wandorobo keep the good honey for themselves and sell
264 only the inferior kind. Men, women, and children eat together.
[252] Both the foods for the man, his wives, and children and, on the other
[415] hand, those for the youth and his favorite girl are cooked in one pot.
From this the food is poured into small wooden bowls (kitokog), of
273 which each adult sharing in the meal has his own. From the food
171 laws of the Masai, the custom that young unmarried men may not
drink honey beer is still found here as a survival. Tobacco is a
276 luxury of the married. Men smoke it, coarsely cut, in pipes carved
by themselves. Ground to powder and mixed with a little steppe
salt and /233/ fat, it serves both men and women for snuffing.
Women also like to chew the snuff.

/235 cont./

231 Then a man climbs up to the beehive, fastens it to a rope, unhooks it, and very slowly lowers it to the ground, so that through the continuing effect of the smoke the bees will also be driven out of the combs or stupefied in them. It is obvious that through this the honey must become very dirty, and, in fact, it tastes strongly of smoke and contains a large number of dead bees and larvae. No other method of driving the bees out is possible, however, and since they are extremely vicious and the people, only scantily clad, expose such large areas for their stings, the honey gatherers have to be enveloped in a thick cloud of smoke for their own protection. I was able to observe the viciousness of the native bees several times. It is by no means rare that a swarm will attack a caravan and sting some of the porters and donkeys into unconsciousness, the latter even to death. Tobacco smoke in particular incites them to attack, but they also seem to dislike loud singing and shouting.

In extracting the honey, one leaves about a quarter of it in each [251] comb so that the bees will not abandon the hive. The extracted honey [415] is packed into leather bags or wooden pots and thus stored. The capture of wild bees is unknown. Where such are found in a hollow [136] tree, one hangs in the vicinity an empty beehive that has previously been smeared on the inside with the extraordinarily aromatic honey of a Melipona species (subspecies Trigona) (2)

2. Identified by Herr Dr. Enderlein from samples sent to the Museum für Naturkunde /Museum of Natural Science/, Berlin.

222 known as el maîn. In order to be able to extract the honey of wild bees from hollow trees, one drives them out by holding aloft a burning branch with which one climbs to the hole.

411 In the camp one sees the men wither squatting about dully or
322 busy with carving, such as the beehives just mentioned, or with
[461] making bows, arrows, and clubs. The stick intended for the making
[462] of a bow (Fig. 83) (from the ol borogoi tree) is rounded, cut tapering at both ends, and then scraped smooth. After it has been rubbed

1; Huntingford E-4, 5 (1938-1939) 1953 FL6 Dorobo FL6

Agriculture

The Dorobo began to cultivate in a small way about 30 years ago (or even a little earlier) and at first they grew only eleusine. Though their inclinations were to become cattle-owners, conditions were unfavourable to the development of cattle-breeding as a primary activity and they have been forced to make agriculture a serious business; for the methods, implements, and even the seed used in this, they have been indebted to the Nandi.

Land

Those who live in A and B domicile categories (with whom alone we are concerned here) cultivate small plots in the open land which surrounds the forest. They have no rights of tenure, except the temporary ones acquired, according to Kenya law, if they live there as squatters under the Resident Native Labourers Ordinance. Their plots, *imbaret*, pl. *imbarenik*, range in size from one acre divided into four individual holdings, to half an acre divided into four holdings; in other cases, plots of a quarter to one-fifth of an acre worked by one person. All plots are fenced, and sometimes a living-hut is built inside the fenced area; occasionally it was found that elderly Dorobo were allowed by Nandi squatters to have a little piece of their cultivated land to work.

European farmers in the district, with whom the Dorobo land question was discussed, seemed not unwilling to let the Dorobo live unmolested on their land provided they gave no trouble; but the government authorities thought otherwise, and the position of a Dorobo who did not choose to become a squatter in order to live on what he considered his own land was thus precarious.

Cultivation Methods and Crops

Two main crops are grown, eleusine, *paiek*, and maize, *ipandek*. Millet had not been grown by 1940, though they bought it from the Nandi. Sweet potatoes, *ropoonik*, are sometimes grown in very limited quantities. Implements are the heart-shaped hoe and the panga or cutlass, both obtained from the Nandi. They have also small axes, *ndolut*, and knives, *rotuet* or *camboluet*.

The growing of crops is regulated by the dry and wet seasons, *muainonik*, from October to March, and *iuotet*, from April to September. The land is prepared between January and April, and planted in April or May according to the rain. Cultivation follows the Nandi method, with paring and burning of new land. The seed of eleusine and maize is bought from the Nandi, usually from squatters living nearby. Maize and eleusine are planted together in the same plot, though potatoes are generally grown separately. Eleusine is reaped in the Nandi manner by cutting off the heads; maize is picked by hand. Granaries of Nandi type are sometimes made, but are seldom needed, as the yields are so small that the loft of a hut can generally hold all that is not eaten on the field (as is often the case with maize). Cereals are roughly ground on slabs of granite in the Nandi manner.

Food

Food in the old days consisted mainly of meat supplemented by honey, wild vegetables, and grain bought by exchange from the Nandi. The food supply is now based on their own agricultural produce, supplemented by milk when they have any, and by certain other foods when they can be got. Meat is still obtained by trapping, though seldom by hunting; it includes the flesh of antelopes, monkeys, pigs, and leopards. Honey is got, as already described, from honey-barrels. Wild food, collected in the forest, includes fruit of the *momoniat* (*rubus rigidus*), *lemsiyuet* (*ximenia americana*), and *sasuriet* (*musa ensete*, wild banana), the sap of the *sasuriet*, and leaves of nettle, *siwot*.

Intoxicating drink is of two kinds: the Dorobo honey-wine, *hiphstinik* or *kumik ap lo*, made from honey, and fermented with the long seed-pods of the "sausage

2: Maguire G-5 (ca. 1926) 1927-28
FL6 Dorobo FL6

clans or families,[1] after the manner of the Masai, but there is no difference between their several bearers at the present time. *Mósiro* and *Médiak* Dorobo live and hunt together all over the southern half of the Masai Reserve to-day. They are fairly numerous[2] (for Dorobo), and in many cases are almost indistinguishable, outwardly, from the Masai.

There, however, the similarity ends, as these Dorobo (referred to, henceforward, as *Mósiro* collectively) are the first with whom we have had to deal possessing a language of their own. Reference to the comparative lists of numbers and the list of names of common objects given elsewhere will show the wide difference there is between the language spoken by these people and that of the Masai.

According to Lekite, who was the only man in recent years holding even a semblance of authority among these people, the "home" of the *Mósiro* is at Talamai.[3] He, in common with many Masai and Dorobo elders, admits that the Dorobo originally came from a country designated vaguely as *Juu*,[4] but no living *Mósiroi* can remember the time when the majority of his people did not live at or near to Talamai.

The *Mósiro* are to be found, occasionally, living with the Masai in the kraals of the latter. They are sometimes (particularly when game and honey are scarce) to be found in small rude kraals of their own, close to the Masai. In these kraals will sometimes be seen a few goats or sheep and almost always fowls.[5] More often, however, the *Mósiro* live in tiny communities (sometimes a man, his wife and their children alone) in the depths of the bush. There they exist, houseless save for a rude shelter of skins within a primitive thorn stockade, by hunting and gathering roots and honey. When supplies run short they beg from the Masai. When a large animal is shot or dies from natural causes the *Mósiro* in the vicinity seem to become aware of the event in the most uncanny way. They will appear unexpectedly, make their camp, and remain until the carcass has been completely denuded of flesh. The meat is not eaten quite raw, but is subjected to a hasty charring, the

[1] More probably the former.
[2] Possibly 1000 souls, including the women and children.
[3] See note 3, p. 127. [4] *Aboos*: in this case meaning the north.
[5] The Masai regard the eating of fowls or eggs as unclean.

FL6 Dorobo FL6

duration of which is in inverse ratio to its toothsomeness and the severity of the cook's hunger.

The Masai are good to the *Mósiro* and seldom refuse them a share in whatever food is obtainable—be it milk, meat or grain. The *Mósiro* expect this; in fact, many of them seem to look on free rations from the Masai as their right. The reason for this is stated to be that the *Mósiro* helped the Masai on many occasions in the past (particularly during the great rinderpest epidemic in the early 'nineties) by hunting for them when starvation had overcome the ingrained antipathy of the Masai to venison. In addition, before the coming of European rule many elephants were killed by the *Mósiro* at the request of the Masai. Lekite told me of one drive in which he and about thirty *Mósiro* were engaged during which sixteen elephants were killed.

When a *Mósiroi* obtained cattle he used, unless restrained by his more prudent friends, to slaughter and eat them in the shortest possible time. Up to quite recently, a beast was valued by the *Mósiroi* only for the amount of meat it was capable of providing, but nowadays a few of them are beginning to herd cattle in a small way and some even live as Masai. It is interesting to note that many of the older generation, particularly the women, profess an aversion to having cattle in the vicinity of their own dwelling- or sleeping-places.

A few *Mósiro* till the land, but in a half-hearted way. They are extremely improvident and prefer to risk almost inevitable famine rather than to exert themselves in cultivating grain. They never expect their women to work in such small plantations as they may have. A *Mósiroi* will cheerfully tramp the bush for a week or more, picking up a most precarious existence on tubers and roots, and will consider himself well repaid if he returns with a few pounds of honey. He will be horrified at the idea of putting in one hour's work each day on a mealie patch for the same length of time.

In the bush, very little in the way of food comes amiss to the *Mósiroi*. Failing meat, his favourite food is honey, but this is regarded as a delicacy and would be eaten wholesale only under the most exceptional circumstances. If meat and honey are unobtainable, the *Mósiroi* has at his command an extensive

6:Huntingford E-5 (1938-1939) 1953 FL6 Dorobo FL6

262 [136] eastern part of the area and towards Londiani. Monkeys and pigs are found both in and outside the forest; leopards live on the edge, and lions are still occasionally met with in the open country near the forest. Antelopes are still found, but they are not so plentiful as they used to be.

Honey is produced in honey-barrels. This constitutes a special department of Dorobo life, and will be described in § 2 below.

Wild vegetable foods which grow in and round the forest are eaten both cooked and raw as relishes or additions to the staple diet of meat and [222] [462] cereals; the task of collecting vegetable food is usually performed by the women. Recorded wild foods eaten are:

Fruit of the *sitotik*, which are something like white currants, dried in the sun and eaten raw.
Fruit of the plant *momonyat*, rubus rigidus.
Fruit of the *lemeiyuet*, ximenia americana.
Fruit of the *sasuriet*, Musa ensete, the wild banana.
Leaves of the *sinot*, girardinia condensata, nettle.
Sap of the wild banana, eaten in place of what the Nandi call *kimiet* or 'porridge'.

222 Banana sap is collected by sticking a flat piece of wood into an incision made in the stem of the tree; a receptacle is hung on the end of the wood and left there for the sap to drip into it. The fruit of the wild banana (a very ●252 poor substitute for the cultivated kind) is placed on the drying tray (*sainet*) over the fire till it is roasted by the heat, and is then broken up with two stones and chewed; it is very hard. Tobacco is bought from the Nandi.

276 439 263 [258] [171] Before trade salt was obtainable through the Nandi, the Dorobo made a substitute from the leaves of the *tepenguet* bush (aemilia integrifolia), or of the *serenguet* tree. Leaves were burned, and the ashes collected in a suitable receptacle, a little water was poured on them and mixed, and the resulting liquid was added to food as needed. Some of the Bantu Kavirondo used to make a similar substitute for salt.

273 [824] Intoxicating drink is chiefly made of honey, though now a little eleusine beer is made in the Nandi manner. The Dorobo method of making *kipketinik* or *kumik ap lo*, "honey-wine", is as follows. As a fermenting agent, the seed-pods of the *rotinnet* tree (kigelia aethiopica or the sausage tree), which may be as much as a foot long and four inches thick, are boiled till quite soft when they are cut into strips and put into the honey to make it ferment. A Dorobo description of the process of making the drink is this:

Kenam rutik, kepele mat si koherer;
They-are-taken the-seed-pods, they-are-boiled-on the-fire that they-may-be-split;
kiune ilosto si kipete tukuk ee somisee kul
they-are-washed-in the-river that they-may-be-lost the-things which-are dirty till
kepumbunit. Kema si keyomio. Kiinde teret
they-become-soft. They-are-put-in-the-sun that they-may-dry. They-are-put-into the-po
ole mii kumiat puc, si konuanit, kiinde eñgaret
where there-is the-honey only, that it-may-become-bitter, there-is-put the-wate

A common practice was for half the party to work along one bank of a stream and the rest along the other bank, so that if there was nothing on one side, those on the other side might be more successful; or if the quarry got across the stream, the men on the other side would be able to deal with it. When a kill was made, all the hunters assembled. The animal was skinned, the meat cut up, and some of it eaten on the spot, either raw, or partly cooked by laying it across a rough wooden framework over a fire. The rest of the meat was divided among them and taken home. In the best days, when meat was plentiful, what was left over was dried and kept either as a reserve or else exchanged with the Nandi for eleusine and millet. A stack of dried meat (*sirikeniot*) about 2 ft. square, was sold for about 25 lbs. of grain. Meat is cut into strips (*sir*, whence *sirikeniot*) which are laid out on the drying tray or loft over the fire to be smoke-cured after being dried on the roof of a hut or in the fork of a tree.

c) Agriculture

Since they can no longer hunt, and present conditions are[18] not favourable for the acquisition of cattle on a large scale (even if the Dorobo had the means of so doing), the adoption of agriculture has become an economic necessity, and methods, implements, and seed have been obtained from the Nandi. This change from hunting to agriculture has taken place virtually between the years 1927 and 1938. In the first of these years the area cultivated by them was so small as to be negligible; but by the latter year their lives were, as we have seen, to a great deal centered on agriculture. And as with hunting in the old days, so with agriculture to-day, the growing of crops is naturally regulated by the wet and dry seasons and the main divisions of the agricultural year are:

January to April: preparation of the land.
April-May: planting.
September: reaping.

[18] This refers to the years 1938-39.

6:Huntingford E-5 (1938-1939) 1953 FL6 Dorobo FL6

is to get as much as possible of the crop out of the way so that ploughing can start at once without having to wait till the crop is ripe. But the Dorobo had, all the same, made a step forward, for a solid, compact stook is less likely to be devastated by animals than plants standing scattered over a field.

By 25 November, 1938 the Kipukua people had reaped their crops. The shamba here was about an acre in extent, and was divided into four approximately equal-sized plots. There was little maize, for some had been eaten on the field and some had been destroyed by vermin; what was left had been stooked, and anything like an accurate estimate was impossible, though there might have been two or perhaps three bags in the stooks. If we estimate that the equivalent of two bags might have been eaten, and two more destroyed by vermin, we have about 6 or 7 bags, a somewhat high estimate for a crop grown mixed with eleusine, but not impossible[99]. Of eleusine, one plot yielded 3 bags, and another 2 bags (that is 5 bags from half an acre), not a great deal, certainly, but a fair yield under such conditions, and most useful as food, for the Dorobo eat most of their eleusine, and turn very little of it into beer. Maize and eleusine are ground by crushing on slabs of granite (*litwito*), and the resulting meal is made into gruel (*muaarek*) for the children, and stiff porridge (*kimiet*) for the older people; it is generally eaten with a mess of vegetable food (*ingurk*) prepared separately.

Storage of crops is not yet a very difficult problem. A few of the Dorobo, it is true, have built granaries of Nandi type, hidden just inside the forest to prevent thefts by the Nandi, for anyone can lift up the roof of such a granary in the night. But since so much of the maize is eaten on the field, what is left at harvest time can be stored in the loft; and the same applies to eleusine, for it does not yield a large amount of grain. I saw no millet growing, and the Dorobo said they bought it from the Nandi.

As we have already noted, agricultural labour is divided to a certain extent between the sexes, but the distinction is not very sharp, and it was found to work out in the following way:

Men:	Both:	Women:
Heavy preliminary work	Digging	
Planting	Weeding	Collecting and burning weeds
	Reaping	

The heavy work includes lopping off branches in the Nandi manner, clearing bushes, and breaking up the ground when hard. Women may also plant, but the tendency seems to be for men to do it, though there is no absolute rule against women planting. Children help with the weeding, and herd the goats when there are any; old men herd cattle, and women also sometimes herd goats.

The Dorobo had not by 1939 acquired the Nandi belief that each eleusine crop requires new land, which in the circumstances is just as well; but they do not hesitate to give up using land which is unproductive. Thus,

[99] The bag is the standard 2 ½ lb. gunny bag used in East Africa, holding 200 lbs. of maize.

/232 cont./

262 If lean times then come, one tries, as well as one can, to appease
the stomach with wild roots or tubers, with berries or other small
[252] fruits, with honey and honey beer. Meat is seldom eaten raw,
251 usually boiled or roasted at the open fire. For storage it is cut into
439 long strips that are hung to dry in the sun. When the meat is well
231 dried, it is stowed away in the aforementioned tree, close to the
camp; cattle and small livestock, which are bought from the Masai
262 for ivory, are not kept, but slaughtered immediately. Insofar as the
[439] Wandorobo, in barter with sedentary tribes, are able to come into
the possession of vegetables, they also live on these, but actually
only during times when, for some reason, only little game is to be
had. Otherwise the vegetable food acquired by trade constitutes
only a side dish, especially for woman and children. Many of them
[272] detest milk and base this on the fact that their stomachs, accustomed
only to meat diet from early childhood, do not tolerate it. Some
go so far as to throw away the udder of a slaughtered cow, although
[171] they eat that of a slain piece of game. There indeed seems to be no
doubt but that the previously mentioned Masai belief, according to
which milk and meat must not be brought together, rests on these
273 customs. Besides water, honey beer, which they make in the same
[271] way as the Masai, also serves them as a beverage. The latter prize
[171] that made by them more than their own, which probably rests on the
fact that the Wandorobo keep the good honey for themselves and sell
264 only the inferior kind. Men, women, and children eat together.
[252] Both the foods for the man, his wives, and children and, on the other
[415] hand, those for the youth and his favorite girl are cooked in one pot.
From this the food is poured into small wooden bowls (kitokoi), of
273 which each adult sharing in the meal has his own. From the food
171 laws of the Masai, the custom that young unmarried men may not
drink honey beer is still found here as a survival. Tobacco is a
276 luxury of the married. Men smoke it, coarsely cut, in pipes carved
by themselves. Ground to powder and mixed with a little steppe
salt and /233/ fat, it serves both men and women for snuffing.
Women also like to chew the snuff.

/247 cont./

278 415 252 (411) 224 (234) (231) When the cooking of the poison is finished, the pot is cleaned with sand and water and used again for the preparation of food. The arrow point is thoroughly cleaned, heated red-hot, and poisoned anew.

The region in question for hunting has been divided by the El dorobo into definite districts, each of which may be hunted in only the community of its inhabitants. A district, in turn, consists of a number of precincts, whose grassy plains are burned off in a sequence following from their location, the weather conditions, etc. The wild animals then gather to graze on the grass soon freshly sprouting after the burning. This management explains why the hunter is only rarely /248/ forced to return home without booty and why he is able to feed his family continuously and regularly from the yields of his hunting.

The game in general in East Africa is game frequenting the same spot; but the meaning of this statement must be modified in accordance with the relatively enormously large areas here. Just as in Germany a hunter expects a herd of deer at a particular time on a particular knoll, the ol doroboni can quite certainly count on finding the game expected by him at the appropriate time in a region whose diameter amounts to approximately 3-5 kilometers. Considerable disturbances (136) are caused, of course, by the appearance of large predatory animals, especially lions almost always hunting in herds and the hyena dogs always hunting together in larger numbers.

In practicing hunting the men split up in such a way that the younger ones do the stalking on the open steppe, whereas the older ones lie in wait at the watering places of the game. Stalking requires incomparably greater endurance and skill than at home. The ol doroboni must more accurately watch the wind, since his own strong odor makes it extremely easy for the animal to pick up the scent. He must take the greatest pains to conceal himself from the sight of the animal, since he is unfamiliar with any kind of adaptation to the region and the surroundings, so that his black body stands out clearly, even at great distances, on the usually light yellow steppe. The difficulty of the rush is further increased by the primitive nature of his weapons, which permit him to make an accurate shot only at 20 to 30 meters. In what concerns the patience, perseverence, and dexterity that the Wandorobo show in this, a European hunter can

6:Huntingford E-5 (1938-1939) 1953 FL6 Dorobo FL6

262 [136] eastern part of the area and towards Londiani. Monkeys and pigs are found both in and outside the forest; leopards live on the edge, and lions are still occasionally met with in the open country near the forest. Antelopes are still found, but they are not so plentiful as they used to be.

Honey is produced in honey-barrels. This constitutes a special department of Dorobo life, and will be described in § 2 below.

Wild vegetable foods which grow in and round the forest are eaten both cooked and raw as relishes or additions to the staple diet of meat and [222] [462] cereals; the task of collecting vegetable food is usually performed by the women. Recorded wild foods eaten are:

Fruit of the *silotik*, which are something like white currants, dried in the sun and eaten raw.
Fruit of the plant *momonyet*, rubus rigidus.
Fruit of the *lemeiyuet*, ximenia americana.
Fruit of the *sasuriet*, Musa ensete, the wild banana.
Leaves of the *sinet*, girardinia condensata, nettle.
Sap of the wild banana, eaten in place of what the Nandi call *kimiet* or 'porridge'.

222 Banana sap is collected by sticking a flat piece of wood into an incision made in the stem of the tree; a receptacle is hung on the end of the wood and left there for the sap to drip into it. The fruit of the wild banana (a very 252 poor substitute for the cultivated kind) is placed on the drying tray (*sainet*) over the fire till it is roasted by the heat, and is then broken up with two 276 439 stones and chewed; it is very hard. Tobacco is bought from the Nandi.

263 Before trade salt was obtainable through the Nandi, the Dorobo made a substitute from the leaves of the *tepenguet* bush (aemilia integrifolia), or of the *serenguet* tree. Leaves were burned, and the ashes collected in a [258] suitable receptacle, a little water was poured on them and mixed, and the [171] resulting liquid was added to food as needed. Some of the Bantu Kavirondo used to make a similar substitute for salt.

273 Intoxicating drink is chiefly made of honey, though now a little eleusine beer is made in the Nandi manner. The Dorobo method of making *kiptetinik* or *kumik ap lo*, "honey-wine", is as follows. As a fermenting agent, [824] the seed-pods of the *rotinuet* tree (kigelia aethiopica or the sausage tree), which may be as much as a foot long and four inches thick, are boiled till quite soft when they are cut into strips and put into the honey to make it ferment. A Dorobo description of the process of making the drink is this:

Kenam rotik, kepele mat si koherer;
They-are-taken the-seed-pods, they-are-boiled-on the-fire that they-may-be-split;
kiune ilosto si kipete tukuk ee somisec kul
they-are-washed-in the-river that they-may-be-lost the-things which-are dirty till
kepumbunit. Kema si keyomio. Kiinde teret
they-become-soft. They-are-put-in-the-sun that they-may-dry. They-are-put-into the-po
ole mii kumiat puc, si kowuanit, kiinde eŋgaret
where there-is the-honey only, that it-may-become-bitter, there-is-put the-wate

FL6 Dorobo FL6

224 825 mind) made by placing the forefingers on either side of the nose and calling into the hollow formed by the palms of the joined hands.[1]

224 411 The *Mósiro* are fast and accurate bowmen at close range, and there are few of them who have not accounted for more than one lion with this weapon. A *Mósiroi* at present in my employ is credited with having killed thirteen lions thus, three of them with one arrow. The arrows, of course, are poisoned,[2] and are discharged with a force that would, I feel sure, excite the admiration of a European toxophilite. A curious, crouching attitude is adopted when drawing the bow-string and the archer faces his target, not adopting the more usual position of standing at a right angle to it. The killing of a lion with the bow is not regarded as an event of especial importance and the carcass is often left to rot in its skin.

261 If trouble is in the wind, the *Mósiroi* will always make for the haven he knows best—the bush. There he will live, apparently quite independent of the products of civilisation, and in nowise inconvenienced by a total lack of water, for weeks at a stretch, returning (when the trouble has blown over) with a skin bottle or bag bulging with honey. I could not understand the apparent ability of the *Mósiro* to live for long periods in country I knew to be waterless until I had been introduced to what they laughingly said was "the dry-season water." This is an enormous tuber[3] with a skin like the domestic potato. Under the skin is a milky, sticky layer about half-an-inch in thickness. This surrounds the inner core, which is of the appearance and consistency of a raw potato, is slightly fibrous and very moist. When this is chewed (the residue is not generally, but may be, swallowed), it gives great relief to thirst. Squeezing or pounding one of these tubers over a cooking-pot will result in the accumulation of a surprising amount of quite

221 222

[1] My predecessor at Kibaya shot two male lions which were "called" to a kill in this way by the *Mósiro*. He sat beneath a tree at a place where two lions had recently killed; the *Mósiro* mounted the tree and began calling. After a short time, one lion came to the kill (a goat) and was shot. The second lion came quite soon afterwards and was duly given his quietus.

[2] See the section devoted to Dorobo arms.

[3] This tuber, called *Kicherembwee*, is also known to the Kitšto Masai and is called by them *Ol-kiserimbwa*. This is a corruption of the *Mósiro* name, and the Masai freely admit that they learned of its existence from the Dorobo.

[824]

shares the *imbaret*, each house having its own 241
strip, the whole being surrounded by a thorn fence 423
which all help to make. Each is therefore a [351]
family or clan *imbaret*, and the group is an [614]
independent labour unit.

The grain crops are stored either in granaries 251
of Nandi type, or else in the loft (*tapot*) of the hut;
but as most of the crop is eaten before or soon 261
after it is reaped, and as the yields are not large
owing to the small areas planted, storage problems
are not yet acute. Further supplies of food are [937]
got (1) by purchase or exchange; (2) by begging [735]

SOURCE: Huntingford, 1929, 1942, 1951, and unpublished material. There are no other sources for the Kipkurerek Dorobo; and except in the case of the Kidog (p. 70 below) there is no material for a description of any other horde; nor are any other population figures available.

PHYSICAL ENVIRONMENT

The North Tindiret Forest lies about five miles from the south-eastern boundary of the Nandi Land Unit, and rises from 7,000 ft. to over 9,000 ft. It consists of two great east–west ridges reaching an altitude of about 8,500 ft. divided by the deeply sunk river Kipkurere, "hollow (river)," the ridges merging some 12 miles from the western edge in the high ground round Timboroa which rises to over 9,000 ft. The region is dense evergreen "high forest," with trees of 100 ft. and over, and thick, impenetrable undergrowth growing to a height of 6 or 8 ft. The average rainfall on a farm two miles from the edge of the forest was 54.09 ins. over a period of nine years. Till within the last 25 years the Dorobo lived in small isolated settlements right inside the forest. Access was given by two parallel tracks across the south-western corner of the forest, and concealed paths branched off from them leading to the settlements. In addition to providing a permanent home, the forest was their wet-weather hunting ground; in dry weather the Dorobo used to hunt far afield over Nandi and the Uasin Gishu Plateau, and down to the Rift Valley. In 1937 they were removed from the forest, and a number of them (of domicile categories A and B) settled round the edge of the forest, along a narrow strip of grassland and bush that forms the upper edge of the farms which occupy the five-mile space between the forest and the Nandi Land Unit. But the intention of the Government had been to transfer the Dorobo to the Nandi Land Unit. This the Dorobo did not agree to, but their re-settlement along the edge of the forest was not officially accepted, and they lived there without legal rights unless they became squatters or casual labourers on the farms they settled on.

MAIN FEATURES OF ECONOMY

Till disturbed by European settlement, the Dorobo had a purely hunting economy, though during the last 30 years they have been taking some interest in the acquisition of cattle and in small-scale cultivation. In their hunting days, their only livestock were bees and dogs.

HUNTING

The year was divided into two seasons, *masinonik*, the dry weather, when they hunted game of all sorts with bow and arrow both in the forest and much farther afield; and *isotet*, the wet weather, when they set traps in the forest. In the past they hunted buffalo and elephant, and lion were killed in the plains; leopard and pig are still hunted. Smaller game hunted and eaten include antelope and monkeys of all kinds: almost any kind of meat was eaten, except that of hyena, jackal, and

[Text continues on P.58--analyst]

1;Huntingford E-4, 5 (1938-1939) 1953 FL6 Dorobo FL6

other scavengers. Nowadays, all hunting activities are carried on illegally with the risk of being punished if caught by the police.

Weapons are the bow and poisoned arrows carried in a quiver. Knives are used to skin game and to make springes. Spears have never been used. The Dorobo used to have hunting dogs, but in the North Tindiret Forest the breed seems to have died out, though it existed in 1927. They have two kinds of trap: (i) The pit trap, *nguret*, formerly used for buffalo, consisting of a pit 8 ft. long, 3 ft. wide, and 6 ft. deep, with wooden spikes set in the bottom. (ii) The springe or snare, *porouet*, which consists, briefly, of a springy stick bent over, with a noose attached to it connected with a platform: the arrangement is such that when an animal treads on the platform its head enters the noose, and the pressure on the platform releases the springy stick, which flies up, tightening the noose, and holding the animal suspended. Such traps can be made in less than ten minutes. This type is used chiefly to catch antelopes, but leopards have been caught in them. Cross-bar traps with a drop-spear were not used by the Kipkurerek Dorobo.

The only hunting taboo recorded is that the night before he goes out hunting a man must abstain from sexual intercourse. This does not apply to the setting of traps.

As regards land rights, the forest was divided into districts, *koret*, pl. *korosuek*, and in his district each man had an hereditary block of land in which he hunted, set traps, kept his honey-barrels, and collected wild food. Occupation rights were recognized by public opinion, and trespass on a man's forest area, i.e., deliberate entry in order to start hunting without permission or the promise of a piece of meat, might result in the trespasser's death at the hands of the owner, who would then have to pay compensation for homicide. Theft of game from a trap is said never to have occurred, not only because the thief might be killed, but because his belly would swell to a great size and he would die after eating meat stolen from a trap.

Bees

Honey is to the Dorobo what milk is to the Nandi: it is "sacred," and its supply must be protected by the observance of taboos. Fruit and blood must not be eaten on the same day as honey (though meat may be eaten); when a comb is emptied, it must be carefully hidden in the undergrowth; and after eating honey a Dorobo cleans his hands in earth, not (like the Nandi) by wiping them with leaves.

The Dorobo recognize four varieties of bee: *sekemik*, the honey-producing kind; *imeiik*, solitary bees which live in trees; *kosomek*, earth bees, which live in the ground; and *kiptulonik*, mason bees, which live in cells made of earth and particles of stone cemented together by their own saliva. The Dorobo divide the honey-bees, *sekemik*, into three kinds: the queen, *kamet ap sekemik*, "the mother of the bees"; the workers, called simply *sekemik*, considered to be males, which make honey by eating the "sap" (*pek*) of flowers and then vomiting it into the empty honey-combs; and the drones, *kapurenik*, considered to be idle females which do nothing useful.

Hives or honey-barrels (*pasanet*) are made either of slats of wood tied together, with circular wooden end-pieces; or of the two halves of a piece of log split longitudinally and tied together. They are set in trees, and when a new hive is put up, the owner calls the bees, in a high-pitched tone, to come and occupy it: "Bees, bees, from all the country, come here now, and pour in honey, pour in honey." Bees are said to recognize their owners by their body-smell, and do not sting them when taking honey. Certainly taking honey does not appear to be a painful or dangerous process to the Dorobo owner. Theft of honey from a barrel is considered very low, and a man might kill a thief, though he would have to pay compensation for homicide.

Honey is an important article in Dorobo economy: it is eaten as food, made into an intoxicant, used for ritual purification, and it forms an article of commerce.

1: Huntingford E-4, 5 (1938-1939) 1953 FL6 Dorobo FL6

AGRICULTURE

The Dorobo began to cultivate in a small way about 30 years ago (or even a little earlier) and at first they grew only eleusine. Though their inclinations were to become cattle-owners, conditions were unfavourable to the development of cattle-breeding as a primary activity and they have been forced to make agriculture a serious business; for the methods, implements, and even the seed used in this, they have been indebted to the Nandi.

Land

Those who live in A and B domicile categories (with whom alone we are concerned here) cultivate small plots in the open land which surrounds the forest. They have no rights of tenure, except the temporary ones acquired, according to Kenya law, if they live there as squatters under the Resident Native Labourers Ordinance. Their plots, *imbaret*, pl. *imbarenik*, range in size from one acre divided into four individual holdings, to half an acre divided into four holdings; in other cases, plots of a quarter to one-fifth of an acre worked by one person. All plots are fenced, and sometimes a living-hut is built inside the fenced area; occasionally it was found that elderly Dorobo were allowed by Nandi squatters to have a little piece of their cultivated land to work.

European farmers in the district, with whom the Dorobo land question was discussed, seemed not unwilling to let the Dorobo live unmolested on their land provided they gave no trouble; but the government authorities thought otherwise, and the position of a Dorobo who did not choose to become a squatter in order to live on what he considered his own land was thus precarious.

Cultivation Methods and Crops

Two main crops are grown, eleusine, *paiek*, and maize, *ipandek*. Millet had not been grown by 1940, though they bought it from the Nandi. Sweet potatoes, *ropoonik*, are sometimes grown in very limited quantities. Implements are the heart-shaped hoe and the panga or cutlass, both obtained from the Nandi. They have also small axes, *ndolut*, and knives, *rotuet* or *camboluet*.

The growing of crops is regulated by the dry and wet seasons, *muainonik*, from October to March, and *iuotet*, from April to September. The land is prepared between January and April, and planted in April or May according to the rain. Cultivation follows the Nandi method, with paring and burning of new land. The seed of eleusine and maize is bought from the Nandi, usually from squatters living nearby. Maize and eleusine are planted together in the same plot, though potatoes are generally grown separately. Eleusine is reaped in the Nandi manner by cutting off the heads; maize is picked by hand. Granaries of Nandi type are sometimes made, but are seldom needed, as the yields are so small that the loft of a hut can generally hold all that is not eaten on the field (as is often the case with maize). Cereals are roughly ground on slabs of granite in the Nandi manner.

Food

Food in the old days consisted mainly of meat supplemented by honey, wild vegetables, and grain bought by exchange from the Nandi. The food supply is now based on their own agricultural produce, supplemented by milk when they have any, and by certain other foods when they can be got. Meat is still obtained by trapping, though seldom by hunting; it includes the flesh of antelopes, monkeys, pigs, and leopards. Honey is got, as already described, from honey-barrels. Wild food, collected in the forest, includes fruit of the *momonial* (*rubus rigidus*), *lemsiyuet* (*ximenia americana*), and *sasuriet* (*musa ensete*, wild banana), the sap of the *sasuriet*, and leaves of nettle, *siuot*.

Intoxicating drink is of two kinds: the Dorobo honey-wine, *hipkelinik* or *kumik ap lo*, made from honey, and fermented with the long seed-pods of the "sausage

1:Huntingford E-4, 5 (1938-1939) 1953 FL6 Dorobo FL6

262 [273] tree," *rotinuet* (*higelia æthiopica*); and *maiyek*, eleusine beer, made, though seldom, in the Nandi way. They also drink a mixture of honey and water called *lokomek*.

Trade and Exchange

439 [648] [177] The inability of the Dorobo to produce many of the things they need has led to the development of a system of exchange with the Nandi, who till recently were almost the only people with whom they had dealings. Relations between Dorobo and Nandi have been such that, though maintaining their complete independence, the Dorobo have not only obtained goods by trade, but have acquired and assimilated much Nandi culture, including language, clan-names, agriculture, and many material features like dress and ornaments. Their relations are in general friendly, for the Nandi like honey and furs which they get most easily from the Dorobo, and [582] there has been an increasing number of marriages of Dorobo men with Nandi women, as well as of Dorobo women with Nandi men. But neither side takes liberties with the other: the Dorobo fear the physical superiority of the Nandi, and the Nandi [181] fear the close-to-nature life of the Dorobo, as well as a certain mystical force as rain-makers which they attribute to them.

[186] From the Nandi the Dorobo get objects of iron, pottery, beads, tobacco, cattle (see below, p. 61), and the seed of cereals for planting. The Nandi get skins and honey from the Dorobo. There are no special places for trade, but the Dorobo go to [437] the nearest smith or potter or other person who can supply them, and make their bargains. This means a journey into the Nandi Land Unit, but other things can be got from the nearest friendly Nandi. The exchange values in 1939 were:

[435]
1 axe for 1 bagful of honey;
1 bundle of tobacco (about 1 lb.) for 1 bagful of honey;
1 arrowhead for 1 gourd full of honey;
1s. worth of trade beads for a gourd full of honey;
1 knife for a day's weeding in the smith's garden;
1 large earthenware pot for 1 large prepared buck skin (usually bush-buck)
1 small earthenware pot for 1 small prepared buck skin (usually duiker);
2 baskets of seed for planting for 1 new basket.

[415] The bag, *motoket*, is made of skin and measures about 8 ins. by 7 ins.; the gourd is about 10 ins. long; the large pot is about 20 ins. high, the small pot about 10 ins. high; and the basket is about 6 ins. deep and 6 ins. wide.

Cattle

231 [177] [648] The Dorobo interest in cattle is probably due to their long contact with the Nandi; but though they desire cattle, they have not the land for them. Yet they have speculated about cattle inheritance, and by 1939 had worked out theoretical rules which they had scarcely had opportunities of testing. When they were evicted from the forest in 1937 they were officially credited with about 2,000 head of cattle; but no census of either people or stock appears to have been made in preparation for this event, and most of these cattle did not belong to real Dorobo. In 1938–9 the numbers of stock which I counted during the compilation of my census were:

	Cattle	Goats	Dogs
Koret of Kipkorom ..	25	15	4
Koret of Sosoiyo ..	54	19	3
Koret of Kelpui	11	0	0

[171] Methods of cattle-management are based on those of the Nandi.

2: Maguire G-5 (ca. 1926) 1927-28
FL6 Dorobo FL6 .

possibly these Dorobo had been poor Masai, who, having lost their cattle, had taken to hunting, is probably the correct one. It would appear likely that the Dorobo in question were *Balaŋga*, though Sir Claud was unable to satisfy himself as to their true origin.

The original *Balaŋga* are stated to have come from the Kisongo [1] district of the Masai. It may be that this is the case, as the name Kisongo originally stood for a very large tract of country—in fact, almost the whole area occupied to-day by the Masai of Tanganyika Territory. It is certain that there now are *Balaŋga* Dorobo with the Masai throughout the length and breadth of the Tanganyika Masai Reserve, and it becomes more difficult daily to find *Balaŋga* who still devote themselves to hunting. Even those who own little or no stock prefer to live with their richer brethren or with the Masai. The younger men have never led a bush life. They carry spears [2] (and, when appropriate, shields) and do not care to be reminded of the fact that they were ever other than the Masai.

Occasionally, when an elephant or other large beast is killed by the European sportsman, a few old men (Masai, to all outward seeming) will make their appearance unobtrusively, generally accompanied by donkeys. Having obtained permission, they will proceed to rip and hack away huge quantities of the flesh with a determination and cheerful abandon seldom to be met with in the Masai. When the donkeys have been loaded with as much meat as they can carry, the old gentlemen will quietly depart, bound, presumably, for a banquet of Gargantuan proportions. Should one ask, they will admit shyly that they are *Balaŋga*, but will almost always add: "We are now Masai again."

I think there can be no doubt that the Masai and the *Balaŋga* are one and the same. The opinions of the Masai (notoriously unwilling to admit the equality of others) and the *Balaŋga* themselves are unanimous on the matter, and I have been unable to discover any shred of evidence to the contrary. It would appear reasonable to assume that the *Balaŋga* are the

[1] Cf. Hollis: *Masai Language and Folklore*: pp. 260, 261. The name would seem to be restricted, nowadays, to an area south-west and west of Arusha. (Map reference: B 5; Kilimanjaro: E, F, I, K.)

[2] The spear would not seem to be an indigenous Dorobo weapon.

2: Maguire G-5 (ca. 1926) 1927-28
FL6 Dorobo FL6

clans or families,[1] after the manner of the Masai, but there is no difference between their several bearers at the present time. *Mósiro* and *Médiak* Dorobo live and hunt together all over the southern half of the Masai Reserve to-day. They are fairly numerous[2] (for Dorobo), and in many cases are almost indistinguishable, outwardly, from the Masai.

There, however, the similarity ends, as these Dorobo (referred to, henceforward, as *Mósiro* collectively) are the first with whom we have had to deal possessing a language of their own. Reference to the comparative lists of numbers and the list of names of common objects given elsewhere will show the wide difference there is between the language spoken by these people and that of the Masai.

According to Lekite, who was the only man in recent years holding even a semblance of authority among these people, the "home" of the *Mósiro* is at Talamai.[3] He, in common with many Masai and Dorobo elders, admits that the Dorobo originally came from a country designated vaguely as *Juu*,[4] but no living *Mósiroi* can remember the time when the majority of his people did not live at or near to Talamai.

The *Mósiro* are to be found, occasionally, living with the Masai in the kraals of the latter. They are sometimes (particularly when game and honey are scarce) to be found in small rude kraals of their own, close to the Masai. In these kraals will sometimes be seen a few goats or sheep and almost always fowls.[5] More often, however, the *Mósiro* live in tiny communities (sometimes a man, his wife and their children alone) in the depths of the bush. There they exist, houseless save for a rude shelter of skins within a primitive thorn stockade, by hunting and gathering roots and honey. When supplies run short they beg from the Masai. When a large animal is shot or dies from natural causes the *Mósiro* in the vicinity seem to become aware of the event in the most uncanny way. They will appear unexpectedly, make their camp, and remain until the carcass has been completely denuded of flesh. The meat is not eaten quite raw, but is subjected to a hasty charring, the

[1] More probably the former.
[2] Possibly 1000 souls, including the women and children.
[3] See note 3, p. 127. [4] *Above*: in this case meaning the north.
[5] The Masai regard the eating of fowls or eggs as unclean.

2: Maguire G-5 (ca. 1926) 1927-28
FL6 Dorobo FL6

duration of which is in inverse ratio to its toothsomeness and the severity of the cook's hunger.

The Masai are good to the *Mósiro* and seldom refuse them a share in whatever food is obtainable—be it milk, meat or grain. The *Mósiro* expect this; in fact, many of them seem to look on free rations from the Masai as their right. The reason for this is stated to be that the *Mósiro* helped the Masai on many occasions in the past (particularly during the great rinderpest epidemic in the early 'nineties) by hunting for them when starvation had overcome the ingrained antipathy of the Masai to venison. In addition, before the coming of European rule many elephants were killed by the *Mósiro* at the request of the Masai. Lekite told me of one drive in which he and about thirty *Mósiro* were engaged during which sixteen elephants were killed.

When a *Mósiroi* obtained cattle he used, unless restrained by his more prudent friends, to slaughter and eat them in the shortest possible time. Up to quite recently, a beast was valued by the *Mósiroi* only for the amount of meat it was capable of providing, but nowadays a few of them are beginning to herd cattle in a small way and some even live as Masai. It is interesting to note that many of the older generation, particularly the women, profess an aversion to having cattle in the vicinity of their own dwelling- or sleeping-places.

A few *Mósiro* till the land, but in a half-hearted way. They are extremely improvident and prefer to risk almost inevitable famine rather than to exert themselves in cultivating grain. They never expect their women to work in such small plantations as they may have. A *Mósiroi* will cheerfully tramp the bush for a week or more, picking up a most precarious existence on tubers and roots, and will consider himself well repaid if he returns with a few pounds of honey. He will be horrified at the idea of putting in one hour's work each day on a mealie patch for the same length of time.

In the bush, very little in the way of food comes amiss to the *Mósiroi*. Failing meat, his favourite food is honey, but this is regarded as a delicacy and would be eaten wholesale only under the most exceptional circumstances. If meat and honey are unobtainable, the *Mósiroi* has at his command an extensive

2: Maguire G-5 (ca. 1926) 1927-28
FL6 Dorobo FL6

knowledge of roots, leaves, berries and tubers of all kinds, on many of which he is capable of supporting life.

Various kinds of honey are obtained in large quantities and they command a ready sale among the Masai, who are, for the most part, too indolent to look for honey themselves. The *Mósiro* are greatly assisted by the honey-bird [1] in their search and do not appear to suffer much inconvenience when stung. The honey is generally removed by hand, the despoiler working placidly in a cloud of angry, stinging bees. Occasionally a tree has to be felled, and in some cases the honey may be so inaccessible that fire has to be resorted to for the purpose of driving the bees away. Thick clouds of smoke are readily produced by the use of the *Endulee* [2] which every *Mósiroi* carries in his quiver.

With regard to the dress of the men, the *Mósiro* are seldom to be found wearing skins. I have seen *Mósiro* wearing a single garment of rough bark-cloth, knotted at the shoulder in the manner of the Masai blanket, but as a general rule their dress consists of a ragged strip of "Amerikani" or blanket, weather-worn in the extreme, tied over one shoulder and confined at the waist by the sword-belt. They say that they no longer wear skins because the latter make too much noise in the bush and lessen their chances of approaching close to game. The women wear a skin garment [3] of the same kind as that worn by the Masai women. They also wear anklets and armlets of wire, but the heavy iron necklaces and *'surutya* earrings of the Masai women are seldom, if ever, seen. It may

[1] *Cuculus Indicator*: a small drab bird about the size of the thrush. It has a short, but very sharp, bill, a white underside and black-striped wings. Its distinctive twittering is often heard in the bush, particularly in the vicinity of bush paths and other places it knows are likely to be frequented by humans. It flies from tree to tree, keeping up its twittering all the time, and is obviously anxious to be followed. I have followed this bird several times, and although honey was not always found at the end of the trail, it invariably led us to places where bees were or had been some time before. The *Mósiro* always answer the cries of this bird, even when they have no opportunity of following it. There are many legends about the honey-bird, which, I think, is to be met with throughout East Africa. The Swahili call this bird *Sego*; the Masai call it *En-johóroi*; the *Mósiro* name it *Chekeandee*; the Nandi, *Chepkeche*.

[2] See the section devoted to Dorobo arms and equipment.

[3] *Ol-ohesenè* (Masai).

2: Maguire G-5 (ca. 1926) 1927-28
FL6 Dorobo FL6

193 women and they ours. Now we live with our cattle like the Masai." This account is far from enlightening, and when Serkala states that the *Aramanik* live as Masai, I fancy he is making too sweeping an assertion. Admittedly, the *Aramanik* of Moipo live as Masai, and so do many *Aramanik* in the central areas of Tanganyika Masailand, but I suggest that the Dorobo living at the north end of Lake Eyasi and those on the Serenget' plain (north-west of the Ngorongoro localities), who live a purely bush life, are also *Aramanik*.[1] Lekite was positive in the assertion that all the Dorobo living as such in the northern areas of the Tanganyika Masai Reserve and, furthermore, all the Dorobo in the Kenya Masai Reserve,[2] are *Aramanik*. I have had no opportunity of testing the accuracy of this statement. However, I do not think it likely that there can be yet another type of Dorobo unknown to those individuals from whose information the present notes have been compiled. If my assumption be correct, I think it may well be that *Aramanik* and *Balañga* (the latter possibly under a different name) constitute the bulk of the Dorobo in Kenya, and that the Dorobo inhabitants of the northern areas of the Tanganyika Masai Reserve are almost all *Aramanik*.

The *Aramanik* at Moipo are not fishermen. They do not eat fish, but they are very partial to the meat and fat of the hippopotamus.[3] They do little hunting nowadays and are, both young men and elders, rapidly becoming indistinguishable from the Masai. The *Aramanik* living further north (notably those to the west of the Rift Wall at Sanjan, Salei and Peiáya) live a bush life of hunting and honey-gathering and are not above shooting a Masai ox when the chance presents itself.[4] They are extremely shy people and I have had little chance of establishing contact with them.

The most remarkable thing about the *Aramanik* is their language. It is guttural in the extreme, and while there would seem to be few of the characteristics of the Masai or *Mósiro*

[1] See p. 131, *loc. cit.* The Dorobo seen by Sir Claud Hollis may, alternatively, have been *Aramanik*.

[2] About 4000 in number.

[3] I have been unable to discover a single individual among the Masai and the Dorobo of all kinds who does not regard the eating of fish as anathema.

[4] According to unauthenticated statements made by certain Masai.

3:Huntingford E-5 (1921-1928)1929 FL6 Dorobo FL6

Hunting.

224 The chief occupation and, in fact, till the last few years, the only occupation of the Dorōbo, is hunting (*sagas*: Kony, *kip-sagas-ian* = hunter). They say that at the present day they do not hunt as much as they used to. All kinds of animals were the objects of the chase; the buffalo (*kiptarorōt*; N. *soiet*), rhinoceros (*kip-komit*), leopard (*melilto*, N.), lion (*sombit*; *ägetuindo* N.,) giant pig (*tumda*, N.) were among the bigger game hunted. Various kinds of monkeys and antelopes are also sought after, both for their skins and their meat. (*See* "Food" for a list of the animals eaten by the Dorōbo.)

[411] The weapons used in the chase are the bow (*kuyuägda*, N.) and arrow (*kōtick*, N; *mbunatit*, etc.), and spears (*olmorondoit*†). Arrows and spears for hunting are
[278] poisoned with a concoction made from the keliot tree (N.).[1] Formerly, before the elephant disappeared from the Tindiret region it was hunted and killed with poisoned spears. Small game, besides being shot, are also caught in traps and snares, of which the Dorōbo have two kinds; buffalo are also caught in the first kind: (1) Pits (*nguret*), covered with thin sticks and leaves, with spikes (*kipuruiyeinat*) set in the bottom. (2) Snares (*porōwet*; N. *mestet*) (Text-fig. 25), which are constructed as follows: a springy stick, A, is stuck in the ground and bent over; to its upper end is fastened a piece of tree-rope, B, which is loosely attached to a hooped stick stuck in the ground, supported by three short upright sticks; a little lower down the bent stick A is fastened a noose made from the ndorokyat tree, which is held in place by a cleft stick stuck in the ground on each side; under the noose is made a little platform of sticks, which is covered with leaves. When this platform is touched, since it is in contact with the stick holding the rope B, it releases the rope, and the stick A flies up, thereby tightening the noose.

[231] Dogs (*ägökto*, pl. *ägökik*) are used in hunting, and are the only animals kept by the Dorōbo who live in the forest. When in the forest they wear leather collars, to which are attached, under the throat, a small bell. The dogs seem to be of a different breed to the ordinary thin-nosed cur so common in native reserves, and they are kept in better condition. Their excrement round the huts takes the place of cow-dung in the neighbourhood of a Nandi hut, and makes the air unpleasant.

A description of the weapons is given on p. 346 below.

Food.

● 869 136 The staple foods of the Dorōbo are honey (*kumiat*, N.) and meat (*panyek*, N.). For meat they kill the following animals:—

Antelopes.

Kipkeseket (N. *kimereraget*,).—Blue duiker (*Cephalophus aequatorialis*).
Mindet (N.).—Red duiker (*C. ignu-isaaci*).

[1] *Acocanthera Schimperi.*

3:Huntingford E-5 (1921-1928)1929 FL6 Dorobo FL6

262 136 Keremsiit (N. *poinet*).—Bush-buck (*Tragelaphus scriptus*).
Irukutet (N. *irukutiet*).—Reed-buck.
Kenyelet (N.).—Oribi.
Kipeomeret (N.).—Water-buck (*Cobus ellipsiprymnus*).

Monkeys.

Sairet (N. *koroiitye*t,).—Colobus (*Colobus guereza*).
Tisiet (N.).—(*Cercopithecus albigularis*).
Chereret (N.).—(*Cercopithecus grisco-viridis*).
Konokchot (N. *moset*).—Baboon.

Other Game.

Toraet (N.).—Wild pig (*Phacochærus æthiopicus*).
Tumda (N.).—Giant pig.
Melilto (N.).—Leopard.
Sombit (N. *ngetundo*).—Lion.
Soiet (N.).—Buffalo.
Pĕliot (N.).—Elephant.

262 137 Of other kinds of food, they eat bananas (*sliuriet* (N.), fruit (*e.g.* berries, such as those of the momonyat (N.) plant, *Rubus rigidus*), nettles (*siwot* (N.), *Girardinia condensata*), and other wild products.

They make honey-barrels (*pasanit*, pl. *pasanik*; N. *moingot*) (Text-fig. 24), in which the bees swarm. The barrels are made either of rough slats of the tenetwet (N. *tenduet*,) tree, or of wide strips of thick bark. The ends of the barrels are made of circular blocks of wood, which keep the slats in place, the slats being bound outside with tree-rope. A hole large enough to admit the hand is left in the middle of the barrel and stuffed with a bunch of leaves. The barrel is placed on forked branches, the hole being in the under side. If the tree is a tall one, a pole is bound to it with tree-rope, by which the owner climbs to the barrel.

222 To take honey, the Dorôbo first makes fire in a loose ball of sasyat (fibre); he puts this under his garment, and taking some leaves of the kipsepuet (N.) tree[1] in which to wrap the honey, climbs up to the barrel. The sasyat is blown till it makes a good smoke, and the bunch of leaves having been removed from the barrel, the smoking sasyat is held to the hole in the barrel. Having waited a little, the Dorôbo inserts his hand and removes the honey-comb (*kipiriityet*) from the barrel, which he wraps in the kipsepuet leaves. Closing the hole, he descends, not worrying about any bee-stings he may receive.

264 In times of plenty, food is eaten in the morning, at midday, and in the evening. If there is no food, the people go hungry and wait till some is produced. The women

[1] *Tilia* sp.

3:Huntingford E-5 (1921-1928)1929 FL6 Dorobo FL6

prepare food and wait upon the men, themselves eating when the men have finished. At the present day the Dorôbo are taking to eating eleusine grain, which is crushed on grindstones (*liitto*, N.) and made into a sort of porridge; and milk, which they obtain from Nandi, if there are any near them. Beer is made from honey, and is called *kipkĕtĭnik* (N.). Tobacco (*tumutet*, N.; or *chepkochûtit*,[1] N.) is bought from the Nandi, and is taken by men, and occasionally by women. It is either chewed (*mit*, N.) or smoked in Kavirondo pipes (*tarûnik-ap-tumutet*, or *kwanîsik*, N.), which are also obtained from the Nandi. The men carry tobacco in cylindrical boxes called *kipruswit* (N. *kipsut*) (Text-fig. 22), made from sessiyat (bamboo), with skin coverings for the ends, to which are attached thin leather thongs, by which the box is slung round the neck.[2]

Agriculture and Stock.

Formerly the Dorôbo possessed no stock, nor did they till the ground. During the last quarter of a century or so a few of those living on the edge of the forest have taken to cultivating small plantations (*imburet*, N.), in which they grow eleusine grain (*olbaiek*†, or *paiek*; N. *pâk*) only. A few possess, at the present day, one or two cows; others have a few goats and sheep; no one has more than 5 to 10 head. The only animals they possess in numbers are dogs.

Dress and Ornaments.

(i) *Males.*—Boys wear skins of antelopes and monkeys (*akuriet*; N. *inguriet*). Warriors wear skin garments of duiker (*ngomuyo*,[3] N.) called akuriet; they wear leg-bells attached to a leather band (*mpitiko*,[3] pl. *mpitikoîsiak*) on the ankles. Nowadays some wear pieces of cotton-cloth (*angat*, N.) dyed brown.[3] Old men wear bush-buck skins (*akuriet*) with the fur left on. Caps (*engeruit*†) are worn, of blue duiker skin with the fur left on, by old men, and of cotton-cloth by warriors. Belts (*entorrit*†) of leather are worn by old men, and of beads by boys and warriors. Necklaces of chains (*sirimdo*, N.) or iron-wire (*asingait*, N.) are worn; also various kinds of iron ear-rings (*olaimeriat*† and *kimeitaiit* (Text-figs. 13–17); N. *kimeitetitiot*) are worn by warriors and elders.

(ii) *Females.*—The dress of the women and girls is very similar to that of Nandi women. They wear skirts (*chepkuiyuit*; N. *chepkuit*) and upper garments (*koliket*, N.), both of tanned leather, with the fur removed, in the same manner as the Nandi women. Their ornaments consist of iron-wire armlets and leglets (*makirorĕnik* and *karik*, N.), and wire necklaces (*asingait*, pl. *asingaîsiek*, N.). Married women wear

[1] *Chepkochutit* means "snuff" in Nandi.

[2] These are similar to the Nandi tobacco-boxes, from which indeed they are probably borrowed.

[3] As do the Nandi, from whom doubtless the custom spread to the Dorôbo.

4:Huntingford E-5 (1938-1939) 1951 FLA Dorobo FLA

614 177 11. Kongot, the only true Dorobo clan-name left, and apparently corresponding to Nandi Kipkoiting; totem, *kipuskeriat*".

The clan-animals are: *kwonyot*, crested crane, called the same in Nandi; *soiet*, buffalo, called *sout* in Nandi; *kipkamoiet*, a small red bird, called the same in Nandi; *kuuskut*, baboon, called *mout* in Nandi; *sowowyo*, duiker, Elgon Nandi *sowoiyon*, Nandi *ceptirkisat*; *tuvut*, bush pig, Elgon Nandi *tovut*, Nandi *tovt*; *ropta*, rain, called the same in Nandi; *kimorokat*, hyaena, called *kimakutiat* in Nandi; *sombit*, lion, called *setundo* in Nandi; *cuswoetiat*, partridge, called *toiyout* in Nandi; *aniata*, the sun, called the same in Nandi; and *kipuskeriat*, snake, called *evout* in Nandi.

The clan is referred to simply as *ovt* and not, as among the Nandi, by the phrase *tiond ap ovt*; and when asking a man his clan the expression is *Na oruunun?* "what is *your ovt*?" whereas in Nandi the question is nearly always put in the form *Ng tiond ap oruunu?* "what is the animal of your ovet?" Clanellows are considered as *kiisenetik*, relatives; marriage [583] within the clan therefore is not allowed, with one apparent exception which will be explained later. Clansmen are addressed commonly as *Oruuyun*, or else as *Ar i apu*, the latter meaning "father's brother's son", and emphasizing the theoretical relationship between clanellows.

[262] There seems to be no sort of restriction on the killing or eating of the clan animal, for as the Dorobo say, *Cito-makiome kitio, kiomo tiosik tukul* ("It is only man that we do not eat, we eat all (other) animals"), and there is not even the half-hearted apology such as that made by a Nandi when he kills his totem by mistake or intention. This negative attitude to the clan animal suggests that the Dorobo clans were originally non-totemic, and that they borrowed the totem idea along with the clan-names and other cultural features.

614 587 Marriage within the clan is forbidden, except in the case of Moi. This exception was explained by three senior elders in the following terms: *Cii nepo Moi kiitwai cepto nepo Moi ingo po kut ake ne moeye kwot ake a makomi tiliet*; *ngut kiitun nepo tiond ake, mapile* ("A man of Moi may marry a girl of Moi if they are of a different house, live in a different parish, and are not related, provided their clan animals are different"). This is because the Moi clan has three totems, so that

> one whose totem is Kongonyot may marry one with Soiet or Kipkamoiet;
> one whose totem is Soiet may marry one with Kongonyot or Kipkamoiet;
> one whose totem is Kipkamoiet may marry one with Soiet or Kongonyot.

The rule of exogamy can therefore be preserved by calling the clan by its animal-name, though ordinarily emphasis is on the clan as a group, and not on its animal. This may be due to Nandi influence, among whom Moi-Moi marriages are common when the parties have different animals. But though permitted by the Dorobo, I found only one actual instance of such a marriage, where a Kongonyot man married a Soiet girl.

[177] There appear to be no restrictions on marriage between clans such as occur among the Nandi. Koraput, for instance, may marry Kapuket, though in Nandi such a marriage is forbidden.

Schoolingford E-5 (1938-1939) 1954 FLA Dorobo FLA

a clear, windless sky. About 10 o'clock a curious whistling noise began to come from a certain part of the forest, and continued, on the same note, and without a break, for several hours. It was certainly no human or machine-made noise, and the Dorobo professed complete ignorance of it. A Nandi who had lived there before the Nandi War told me afterwards that it was an evil spirit whistling in the forest, "for we used to hear them whistling to each other like that in the forest when I was a child".

Between people and the things on which they depend for their existence both spiritual and material there is a connexion which is best expressed in terms of a ritual relationship. Things have a ritual value for people, and people themselves have a ritual status which is a relationship with their surroundings that can be altered for better or for worse according to the way in which they respect the ritual value of the things around them. Religion and magic form the procedure which protects these ritual values and status, while political organization is, in a sense, no more than an effort to maintain the ritual status of the horde in spite of the tendency of its members to injure their own ritual status and in consequence that of the horde also.

Certain things that a person does, whether voluntarily or involuntarily, cause deterioration of ritual status; but the original status may be recovered by the performance of certain ritual actions which may involve some personal effort or sacrifice. Examples of acts which cause loss of ritual status, and the means taken to restore it, are: (1) A girl who bears a child before marriage must have the undigested grass (*siyat*) from the stomach of a goat rubbed over her face, neck, and breasts, and must then wash it off. (2) After a woman has given birth, she is in a condition of much reduced ritual status, and her husband must rub goat's fat and *siyat* over her face, breasts, and belly. (3) A man who has killed a Dorobo must have goat's fat rubbed all over him. (4) One who has killed an enemy must have stripes of white earth painted on his face. In all these cases the people have done something which causes loss of ritual status, making them ritually unclean (*suuta* or *sowin*) and so a source of danger to others till they have been purified. The potential danger is removed by means of something which has a ritual value. Moreover, an essential element in the cleansing process is sacrifice, that is, the use of the material must either involve giving up something which is valued, or it must require some effort or even risk to get hold of. The *siyat* or fat must be from a domestic animal: if the person concerned has one, he must use it; if he has none, then he must get one, and without delay, which for a Dorobo usually meant that he had to steal it, and thus risk getting killed while doing so. Therefore there is an act of faith in these magico-religious performances, and people believe so firmly in the efficacy of what they do that they are prepared to risk danger in order to get the necessary materials. The use of white earth may entail no more than a journey to get it, but that still means a personal effort on somebody's part. Materials which are used for the restoration of ritual status, and in consequence have a special ritual value, include: the flesh of goats, which is eaten when twins are born, and in cases of incest; *siyat*, the undigested grass from the stomach of a ruminant (a sheep

5:Huntingford E-5 (1938-1939) 1954 FL6 Dorobo FL6

A comet is a sign of coming famine, not merely for the person who sees it, but for everybody.

This short statement may not seem to imply a very great use of magical practices. Nevertheless it is clear from the general trend of knowledge of the Dorobo that the important parts of their life are helped and controlled by magic. The recovery of ritual status after child-birth and after the birth of twins is achieved by magical means; the spirit-name given to a child is intended to link it, in a way that can quite properly be called magical, with the spirit-world, so that it starts life on good terms with those powerful and capricious beings; the whole idea of circumcision (even if it is borrowed) is that of the transition by means of a magico-religious performance from the state of boyhood to that of manhood; these and other observances and avoidances are all magic, and are done because people believe that by doing them they will be enabled to go on existing.

b] Analysis of Beliefs

Ritual Values. Things which have ritual value fall into three categories: (1) things which provide sustenance, or are closely connected with such things; (2) things of the spirit world; (3) things used to restore ritual status:

(1) Honey is sacred, like milk to the Nandi; and in addition to the taboo on eating honey and fruit on the same day, trees, flowering plants, and grass have ritual value because they are all closely connected with the provision of honey: trees, because bees live in them; flowers, because bees get honey from them; and grass, because the flowers and trees may be damaged if it is burned. The last notion means that unlike the pastoral tribes, the Dorobo do not burn grass near forest.

(2) The spirits are offered honey and honey-wine, which thereby acquire an additional value in that their use is directed to both the dead and the living.

(3) Things used for the recovery of damaged ritual status include goats and sheep, and certain of their products, i. e. *eiyat*, and fat, as well as 'butter' or *wsait ap tangina* from cows. All these come from sources which formerly were hardly possessed at all by most Dorobo, and even to-day only on a small scale. Honey-wine is used a good deal, as well as white earth.

Each period of life has what might be called a standard ritual status, which is changed to a different standard on circumcision, when a boy becomes a man and a girl a woman, with the right to marry and produce children. The ritual status of normal adults is altered under certain conditions: (1) a man setting out to hunt is not in the same ritual state as when he is staying quietly at home, and he must not have sexual intercourse at such a time, i. e. just before he starts or, should he have an opportunity, while away; (2) a person sick of an illness has a status different from that of other people; (3) touching a corpse causes deterioration of ritual status; (4) the breaking of a taboo affects ritual status; (5) women suffer deterioration of ritual status through the birth of a child before marriage, the birth of twins, and even, to a lesser extent, normal birth. In all cases, the status must be restored by a ritual performance.

61Huntingford E-5 (1938-1939) 1953 FL6 Dorobo FL6

The economic unit is the family, of whatever kind, elementary or domestic, living alone or within a group. The unit formed of a man, his wife, and their children can actually provide itself, under normal conditions, with most of its necessary subsistence, with a certain amount of help from those to whom they are entitled to turn for it. The first necessity is of course food. This is of two kinds, meat and vegetable, and the second sort is now both wild and cultivated, though formerly the Dorobo ate but little in the way of cereals; restrictions on hunting have now forced them to do so. In the old days meat and honey were the principal foods, vegetables being eaten as a relish. The foods now eaten may be classed under the following heads in order of traditional importance:

592 594 262 [224]

1. Meat: got by hunting and trapping.
2. Honey: from their honey-barrels.
3. Wild plants: collected.
4. Salt: made or bought.
5. Drink: made from honey.
6. Cereals: eleusine and maize, grown; maize, bought.
7. Milk: for those who have cows.

[263]

Almost any kind of meat, except that of scavengers like jackal, hyaena, mongoose, etc., was and still is eaten, including antelopes, monkeys, and bigger game. Of antelopes they eat the following:

*Ngemwuyot**, the common duiker (cephalophus Grimmi).
Kipsekeset, the blue duiker (C. aequatorialis).
Mindet, the red duiker (C. igna-issaci).
Keremaiit, the bushbuck (Tragelaphus scriptus).
Irukutet, the reedbuck (Cervicapra arundinum).
Kenyelet, the oribi (Ourebia montana).
Kipsomeret, the waterbuck (Cobus ellipsiprymnus).

Of monkeys they eat:

Sairet, the colobus (Colobus guereza).
Tisiet, Sykes' monkey (Cercopithecus albogularis).
Cereret, grey monkey (C. griseo-viridis).
Konokcet, the baboon (Papio cynocephalus).

And of other animals they eat:

Torret, the wild pig or wart-hog (Phacochoerus aethiopicus).
Tumia, the giant pig (Hylochoerus Meinertzhageni).
Melillo, the leopard.
Sombit, the lion.
Soiet, the buffalo.
Peliot, the elephant.

There are, however, no elephant in the Dorobo country to-day, nor have there been within living Dorobo memory; but buffalo still occur in the

[136]

6:Huntingford E-5 (1938-1939) 1953 FL6 Dorobo FL6

262 [136] eastern part of the area and towards Londiani. Monkeys and pigs are found both in and outside the forest; leopards live on the edge, and lions are still occasionally met with in the open country near the forest. Antelopes are still found, but they are not so plentiful as they used to be.

Honey is produced in honey-barrels. This constitutes a special department of Dorobo life, and will be described in § 2 below.

[222] [462] Wild vegetable foods which grow in and round the forest are eaten both cooked and raw as relishes or additions to the staple diet of meat and cereals; the task of collecting vegetable food is usually performed by the women. Recorded wild foods eaten are:

Fruit of the *sitotik*, which are something like white currants, dried in the sun and eaten raw.
Fruit of the plant *momonyat*, rubus rigidus.
Fruit of the *lemeiyuet*, ximenia americana.
Fruit of the *sasuriet*, Musa ensete, the wild banana.
Leaves of the *siuot*, girardinia condensata, nettle.
Sap of the wild banana, eaten in place of what the Nandi call *kimiet* or 'porridge'.

222 Banana sap is collected by sticking a flat piece of wood into an incision made in the stem of the tree; a receptacle is hung on the end of the wood and left there for the sap to drip into it. The fruit of the wild banana (a very 252 poor substitute for the cultivated kind) is placed on the drying tray (*sainet*) over the fire till it is roasted by the heat, and is then broken up with two 276 stones and chewed; it is very hard. Tobacco is bought from the Nandi.
439 Before trade salt was obtainable through the Nandi, the Dorobo made 263 a substitute from the leaves of the *tepenguet* bush (aemilia integrifolia), or [258] of the *serenguet* tree. Leaves were burned, and the ashes collected in a suitable receptacle, a little water was poured on them and mixed, and the [171] resulting liquid was added to food as needed. Some of the Bantu Kavirondo used to make a similar substitute for salt.

273 Intoxicating drink is chiefly made of honey, though now a little eleusine beer is made in the Nandi manner. The Dorobo method of making *kip-ketinik* or *kumik ap lo*, "honey-wine", is as follows. As a fermenting agent, [824] the seed-pods of the *rotinuet* tree (kigelia aethiopica or the sausage tree), which may be as much as a foot long and four inches thick, are boiled till quite soft when they are cut into strips and put into the honey to make it ferment. A Dorobo description of the process of making the drink is this:

Kenam rutik, kepele mat si kokerer;
They-are-taken the-seed-pods, they-are-boiled-on the-fire that they-may-be-split;
kiune ilosto si kipete tukuk ce somisec kui
they-are-washed-in the-river that they-may-be-lost the-things which-are dirty till
kepumbunit. Kema si keyomio. Kiinde teret
they-become-soft. They-are-put-in-the-sun that they-may-dry. They-are-put-into the-po
ole mii kumiat puc, si konnanit, kiinde eŋgaret
where there-is the-honey only, that it-may-become-bitter, there-is-put the-wate

6:Huntingford E-5 (1938-1939) 1953 FL6 Dorobo FL6

kopotok. Kiinde tapot hut korurio. Peni-e ekosiek ce caw si korurio 273
as-well. It-is-put-in the-loft till it-ripens. It-remains the-days many that it-may-
hut koiek maiyak. Kiie.
ripen till it-becomes the-drink. (Then) we-drink.

(Some seed-pods are boiled so that they can be split; they are washed in the river to remove any dirt sticking to them, and then when they have become quite soft, they are put in the sun to dry. The dried strips are next put into a pot containing honey and nothing else, to make it bitter, i. e. to ferment it, and some water is added. The mixture is put in the loft to ferment. It is left for several days till it is ready and can be drunk. Then we drink it.) Another drink called *lokomek*, or honey-and-water, is also a favourite of the 272
Dorobo; it is not intoxicating and is much simpler to prepare than honey-wine, being simply honey and water mixed together, without the addition of seed-pods, and drunk the same day without any fermentation.

In the old days, the Dorobo say, they were seldom absolutely without 262 ●
food, for meat could generally be got with either bow or trap, and unless a 224
man was ill or away, when someone would help his family with food, he could 177
usually get enough to feed them. This is probably true, for in those days game was plentiful enough, and there were no Europeans to restrict their hunting activities. Nowadays, when hunting is curtailed, and reduced to little more than trapping, there is an uncertainty about the food supply which even the introduction of agriculture and the nearness of European farms does not altogether remove. A man may be just unlucky with his trapping: European influence, as "harmful magic", is blamed for this; and his crop may be a 262
small one, or much damaged by vermin. And although one member of a [464]
family may even be a wage-earner on a neighbouring farm and get a daily [466]
ration of 2 lbs. of maize meal when he works, he has to feed not only himself [693]
but his own family and perhaps others. For instance, a man of my acquaintance named Arap Keter had to feed his wife, his child, his sister, and his mother, as well as himself. Arap Ruto, one of his neighbours, who also worked on a farm, had at times to feed his brother Arap Minin, his wife, his four children, and his mother. Two pounds of meal a day do not go far to eke out a small crop and the produce of the traps and honey-barrels when divided among eight people in a bad season. Shortages are remedied as far 476
as possible by the principle of sharing, and a man who has food left over after feeding his own family must, and does, help to feed certain others if need be. Arap Ruto, as we have just seen, has had to feed seven people besides himself at times; but in the past the normal rule of food distribution 224
was that a man provided meat for his wife and children, for his parents, and 476
sometimes his wife's parents, since the old people, as always, depend on what [888]
their sons and sons-in-law can give them. A successful hunter also shared his kill with those who went with him and were unlucky. The distribution of meat was thus as follows:

Hunter
1. Own family.
2. Own parents.
3. Wife's parents.
4. Fellow hunters.

6:Huntingford E-5 (1938-1939) 1953 FL6 Dorobo FL6

433 the absence of pastoral and agricultural techniques and vocabulary, by their myths, and in fact by everything about them. To-day it is true that they are becoming agriculturalists, as the following analysis of their economic activities will show:

			Past: →	Past: →	Ideal: (in most cases)
[462] [594]	Family	Men:	Trapping game in the forest	Cultivation of shambas	Stock
			Making weapons, honey-barrels, etc.		
			Some: working for wages		
		Women:	Preparing the results of trapping	Cultivation of shambas	
			Making baskets, skin clothes, etc.		
			Housework and food collecting		
[857]		Children:	Weeding		
			Herding		
			Housework		
[462]	Men Living Alone:		Trapping	Cultivation of shambas	Stock
			Making things		
			Preparing the results of trapping		
			Cooking, housework		

[556] Dorobo life therefore converges on cultivation, with a hunting background, and stock in view as the ultimate achievement. For though the hunting instinct is still very much alive, and though a great deal of time is now spent on cultivation, there is no doubt that the Dorobo (in 1939 at least) had a livestock economy in their minds as the ultimate goal.

2. Economic Activities

a) Bee-keeping

● 262 [778] [231] 264 Honey is to the Dorobo what milk is to the Nandi. It is semi-sacred and has a high ritual value, in consequence of which certain rules must be observed lest the supply fail. A person must not eat fruit or blood on the same day that he has eaten honey, though he or she may eat meat. After eating honey, bits of the comb must not be left lying on the ground, but must be hidden in the undergrowth. Arap Minie said, somewhat unconvincingly, that the reason for this was "that other people shall not see them and so be led to your honey-barrel". But this is probably not the true reason, which may be either simply respect to the honey, from a fear that if treated disrespectfully the supply will fail; or else fear of a witch putting a spell on the bees or honey [789]

61:Hastingford E-5 (1938-1939) 1953 FL6 Dorobo FL6

through the piece of comb. After eating honey a Dorobo wipes his hands in the earth to clean them; whereas a Nandi uses leaves.

One of the accusations often made against the Dorobo as forest dwellers is that by burning grass and firing trees when taking honey they cause forest fires. Apart from the fact that there is no evidence to support this allegation, for the Dorobo do not burn trees, a very good reason why they do not destroy them was given by a Dorobo who said, with reference to some people in his settlement,

Kopel lakok ap Kaptolelac susuek ap timdannyon. Makicome
They-burn the-children of Kolelac-family the-grass of forest-our. We-do-not-like (it)
anun mopelo Okiek timdo ne tinye lukuk ce kioma,
for they-do-not-burn the-Dorobo the-forest which it-contains the-things which we-eat,
ngui ne mii pasanet ap sekemik: ngui kololio taptet ne
also where there-is the-honey-barrel of the-bees; also it-is-burned the-flower which
one sekemik.
they-eat the-bees.

(The children of the Kolelac family are in the habit of burning the grass beside our forest. We disapprove of this, for the Dorobo do not burn the forest which contains the things they eat, and where they keep their honey-barrels; moreover, grass-burning destroys the flowers from which the bees get their honey.) The Dorobo in fact love their trees, and with these very practical reasons for not destroying them, it is absurd to accuse them of what amounts to an anti-social practice among themselves. Nor did the forest itself either in 1927 or in 1939 show signs of the alleged wanton destruction by fire attributed by some to the Dorobo.

Although wild honey is to be found in hollow trees and holes in rocks, the Dorobo do not rely on such chance finds for their supply, though they will eat it if necessary. They rely on the honey which they get from their own honey-barrels.

They recognize four varieties of bee:

Sekemik, social bees, Apis mellifera, the honey-producing bees which live in hollow trees and honey-barrels.

Imeiik, solitary bees, Osmia, which live in trees and hollow stems of shrubs and make honey.

Kosomek, earth bees, Halictus, slightly larger bees which live in holes in the ground and make honey.

Kiptulonik, mason bees, Chalicodoma, which live in cells made of a sort of cement formed of earth, minute stones, and their own saliva. These are very small bees, which make only a small amount of honey, and are not found in the forest, but in Soiin below the escarpment.

The Nandi word *kulumbenik* meaning another variety of bee, is used by the Dorobo, not of bees, but of small stinging insects like mosquitoes.

The bees that provide the Dorobo with their honey are the *sekemik*, of which there are, they say, three kinds: the queen, the workers, and the drones. The queen, *kamet ap sekemik* or "the mother of the bees", is

6:Huntingford E-5 (1938-1939) 1953 FL6 Dorobo FL6

the bow. Quivers are made of ox-hide. Arrow-poison is made from the bush called *keliot* (acocanthera Schimperi), the use of which the Nandi say was discovered by the Dorobo [16]. It is made in this way: leaves and branches are broken off and boiled in a pot for several hours. The resulting liquid is strained and boiled again till it becomes thick and tar-like. When cool it is placed on a sheet of bark, covered with another piece of bark and put in a tree out of the reach of children, together with the pot in which it was boiled. After making poison a man must purify himself by bathing in a river. *Keliot* poison acts very quickly, but does not make the whole of the animal killed by it unfit to eat. The flesh round the site of entry is cut away and destroyed, and the rest is eaten with safety.

The Dorobo used to have hunting dogs (*wokto*, pl. *wokik*) which at one time were the only animals they kept. They still have dogs, but the hunting breed which I saw in the Kelpui-Kipkorom area in 1927, seems to have died out, for though I saw a few dogs there in 1939, they were nothing more than the ordinary native type, the thin-nosed cur so common in Native Reserves and on farms wherever Africans are found. The original breed, as I saw it in 1927, had, it is true, a tightly curled tail, but was a much better looking animal, of a different shape, and much fiercer, resembling the so-called '*basenji*' dog of the Belgian Congo [17] more than anything else, especially in its prick ears, tail, and carriage, though it could bark. When in the forest, the Dorobo put leather collars on their dogs, with a small bell under the throat so that they could tell where the animals were when they put up game. It was noticeable both in 1927 and 1939 that the Dorobo treated their dogs better than Africans usually do — they paid more attention to them, played with them, and fondled them.

The traps used by the Kipkurerek are of two kinds: the pit-trap, and the springe. The pit-trap, *nguret*, is simply an oblong pit about 6 to 8 ft. long, 3 ft. wide, and 6 ft. deep, dug with digging-sticks, and the earth removed in bags or baskets. Wooden spikes, *kipuaiyeinat*, were often set in the bottom, and the whole was covered with thin sticks concealed by a layer of grass and leaves. The trap was dug across a path known to be used by buffalo, the animal it was chiefly intended to catch. This type is no longer used. The springe is the only trap used to-day. It is called *porost*, and can be made in a very short time by almost any Dorobo. It is used chiefly to catch smaller game like antelope. The materials required to make a springe are wood, liana, and grass, and the only tool used is an axe or *panga* (the long-bladed knife or cutlass common in Africa, and now often used by Dorobo). The trap about to be described was made for me on the edge of the forest at Kipkorom by Coimin arap Katam on 9 July 1938. It took him about 12 minutes from start to finish, and did all that was claimed for it; it should be noted that he was somewhat out of practice, and probably took a little longer than a man who was constantly making traps.

[16] Cf. Hollis, The Nandi. Oxford 1909. p. 108.
[17] Cf. Capt. G. Dollman in Journ. Roy. African Soc. 36. 1937. 148.

6:Huntingford E-5 (1938-1939) 1953 FL6 Dorobo FL6

is to get as much as possible of the crop out of the way so that ploughing can start at once without having to wait till the crop is ripe. But the Dorobo had, all the same, made a step forward, for a solid, compact stook is less likely to be devastated by animals than plants standing scattered over a field.

By 25 November, 1938 the Kipukua people had reaped their crops. The shamba here was about an acre in extent, and was divided into four approximately equal-sized plots. There was little maize, for some had been eaten on the field and some had been destroyed by vermin; what was left had been stooked, and anything like an accurate estimate was impossible, though there might have been two or perhaps three bags in the stooks. If we estimate that the equivalent of two bags might have been eaten, and two more destroyed by vermin, we have about 6 or 7 bags, a somewhat high estimate for a crop grown mixed with eleusine, but not impossible[20]. Of eleusine, one plot yielded 3 bags, and another 2 bags (that is 5 bags from half an acre), not a great deal, certainly, but a fair yield under such conditions, and most useful as food, for the Dorobo eat most of their eleusine, and turn very little of it into beer. Maize and eleusine are ground by crushing on slabs of granite (*liteito*), and the resulting meal is made into gruel (*musarek*) for the children, and stiff porridge (*kimiet*) for the older people; it is generally eaten with a mess of vegetable food (*inguek*) prepared separately.

Storage of crops is not yet a very difficult problem. A few of the Dorobo, it is true, have built granaries of Nandi type, hidden just inside the forest to prevent thefts by the Nandi, for anyone can lift up the roof of such a granary in the night. But since so much of the maize is eaten on the field, what is left at harvest time can be stored in the loft; and the same applies to eleusine, for it does not yield a large amount of grain. I saw no millet growing, and the Dorobo said they bought it from the Nandi.

As we have already noted, agricultural labour is divided to a certain extent between the sexes, but the distinction is not very sharp, and it was found to work out in the following way:

Men:	Both:	Women:
Heavy preliminary work	Digging	
Planting	Weeding	Collecting and burning weeds
	Reaping	

The heavy work includes lopping off branches in the Nandi manner, clearing bushes, and breaking up the ground when hard. Women may also plant, but the tendency seems to be for men to do it, though there is no absolute rule against women planting. Children help with the weeding, and herd the goats when there are any; old men herd cattle, and women also sometimes herd goats.

The Dorobo had not by 1939 acquired the Nandi belief that each eleusine crop requires new land, which in the circumstances is just as well; but they do not hesitate to give up using land which is unproductive. Thus,

[20] The bag is the standard 2 ½ lb. gunny bag used in East Africa, holding 200 lbs. of maize.

7: Wayland N-5 (ca. 1926) 1931 FL6 Dorobo FL6

241 beer called *ses* is brewed from *ripp*. Planting is done in a season called *Loukwung*, when there A form of
[273] are, or should be, light rains. This is well recognized, as are two other seasons or months:
[132] *Lovara*, a time of rain; and *Loichetto*, a time of much rain.

805 *The Calendar.*—The Wanderobo are very hazy about the calendar, and disagree among themselves about it. The "year" appears to be divided into six months, of which the following lists were compiled from those who pretend to know about them. No two agree, it will be noticed, except 3 and 4, which are probably wrong, for my informants displayed much uncertainty.

1.	2.	3.	4.	5.
Ladunga.	*Loukwung.*	*Ladunga.*	*Ladunga.*	*Loukwung.*
Lemuka.	*Ladunga.*	*Loukwung.*	*Loukwung.*	*Lovara.*
Lukwu.	*Loumuk.*	*Loumuk.*	*Loumuk.*	*Loichetto.*
Lovara.	*Loichetto.*	*Loichetto.*	*Loichetto.*	*Loudunga.*
?	*Lovara.*	*Lovara.*	*Lovara.*	?
?	?			

262 *Food.*—In addition to the above-mentioned grain the Wanderobo will eat almost anything they can get their teeth into, but I do not gather that they will eat human flesh. They will devour any kind of antelope or pig, elephant, rhinoceros, etc., also carnivores of all kinds, except the hyæna; nor do they eat chicken (the Dodotho say that this is because they—the Wanderobo—do not possess any) or snakes. Honey is greatly prized, and bee-traps are set
[222] far and wide in the trees.

462 *Division of Labour.*—A man's work, except during the hunting season, is wood cutting and attendance on the crops, where his main function is that of a scarecrow. During the hunting season all the able-bodied men leave the village in search of game, which they spear and trap. On wet ground they will actually run down a buck. When the hunters are out, work in the fields and village is done by women, children, and old men. The boys help with the crops, and the girls are employed in the village grinding grain and fetching water with the women. The very old people sit about and take little active part in the life of the community.

517 *Recreations.*—The Wanderobo have no musical instruments. They rarely dance, and while the children doubtless play games I gathered no reliable information under this head.

439 *Manufactures.*—The Wanderobo are peculiarly wanting in this respect. They make neither
[285] baskets nor pottery. The former I did not see among them (the people were found to be using
[323] gourds as cooking pots). The latter is obtained from the Dodotho in exchange for tobacco.
[415] Their shields (*kezen*) are similarly obtained, while their spears (*biss*) come from the Dodinga
[411] country, just over the border in the Sudan. It is noticeable that they use the short stabbing
[352] spear. These, it may be noted, are the only tanged spears I saw in Karamoja. They use headrests (*nekicholung*) of Dodotho origin; as with all other tribes in this part of the world,
[531] they carry their water in gourds, upon which they frequently carve crude designs.

9:Hobley G-5 (ca. 1900) 1903 FL6 Dorobo FL6

They are said to be very prolific, having families of eight to ten children, but the infant mortality is so extremely heavy that their numbers increase very slowly; this mortality is probably due to the cold, damp climate of the Mau Forests, which are at an altitude ranging from 7,000 to 9,000 feet.

Their peace ceremony consists of cutting off a dog's ears, and the contracting parties then spatter one another with the blood.

They live principally on Colobus and other monkeys, which they shoot in the forest: At certain seasons, however, they go and hunt big game on the plains, known as the Rangata Nyuki; they wait till the grass is dry, and then burn it to facilitate their hunting. They use poisoned arrows for big game, and unpoisoned ones for monkeys, &c. They train dogs to assist in their hunting, and are very keen to get young dogs for the purpose. They told me that they first gave the dog certain medicine, and the animal could then track game.

They are very clever elephant hunters, and informed me that when they came across an elephant they went off and bathed and scrubbed themselves very carefully to remove all trace of the human scent, and that they were then able to approach a sleeping elephant and spear it with a poisoned dart.

They are most expert in the use of a firestick. The fire is produced in the ordinary way by the friction of one stick spun round vertically in a depression in another piece of wood, which is held firm between the bare feet of the operator; the lower piece of wood appeared to be the juniper of Man.

A small vocabulary of their language is appended on the opposite page. They use the Nandi numerals.

The prefix "ki," and the suffixes "et," "it," and "ek," are, I think, brought in from the Nandi language, but most of the roots will be found to be quite distinct. Many of the tribe can only speak Nandi, and when collecting this vocabulary in many cases they appeared to have forgotten the Oggiek or Omotik word but gave the Nandi word, and had to consult among themselves and, as it were, hunt up the proper word. The language is thus evidently dropping into such disuse that it will probably become quite extinct in the near future.

C. W. HOBLEY.

[99]

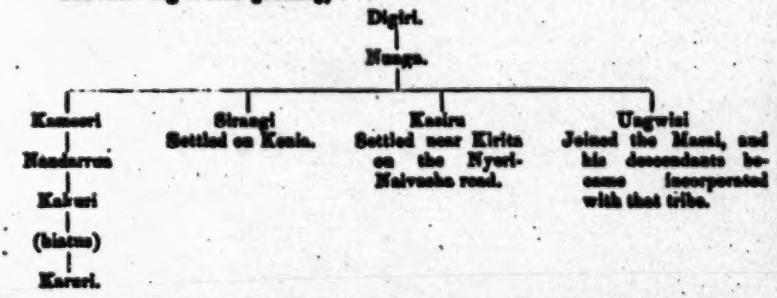
Notes on the Dorobo People and other Tribes; gathered from Chief Karuri and others. *By C. W. Hobley, C.M.G.* 78

101 The true Dorobo people are called Asi by the Kikuyu people and call themselves Aggiok (or Oggiok) or Ogiochua.

Mr. Hollis tells me that the Nandi call them Okiok (singular Okiot), the Masai Il-Torobo (singular Ol-Toroboni).

131 [648] 173 614 [769] They inhabited the whole of the East Africa highlands from Nandi to Kenia before the Masai invaded the country. The most important clan among the Aggiok is the Digiri (*see* MAN, 1903, 21), the name Digiri being that of their earliest known ancestor. Digiri, however, appears to have lived so long ago that all details about him are lost, and the first ancestor remembered by most is one Nunga, who was a very powerful person, and nearly all the Aggiok are said to trace their origin to this chief.

The following is their genealogy :—



614 [304] [191] Kameeri, Sirangi, and Kasiru are now the names of three clans of the Aggiok.

Before the Masai came none of the Aggiok circumcised and they all spoke one language. The totem of the Aggiok is the ant-bear, which is called Ungure, they do not eat carnivorous animals or birds of prey, but eat all other animals and birds.

[262] [173] [648] The Digiri have a distinct legend of the invasion of the Masai: they describe how one day a Digiri hunter on the Emoo Narok saw a great company of people coming from the north; the hunter was afraid and hid among the rocks, but he was seen,

Both the social and the economic ranges of the Dorobo are very narrow. The family is a self-supporting unit, and a group of families forms a social unit; but the group is isolated, and the groups cohere through their strong clan solidarity and strict exogamy. There is no "tribe" as e.g. the Nandi, but a collection of family or clan groups forming a *koret* or district, and a collection of such groups within a given area having a common organization, customs, and dialect, and the innate idea that "we are the Dorobo of such-and-such a place." Thus the Kapchepkendi Dorobo (with whom this paper deals) distinguish themselves from the Dorobo living on Tindiret hill, though that hill is only some seven miles from Sosoiyo. (See map of the Dorobo country.) Before the Government dispersed them, the Dorobo possessed, more or less undisturbed, the whole of the forest. Now they have no land at all. But they maintain their solidarity in spite of disruption, by means of their isolation, strong clan-system, and the fact that outsiders, e.g. the Nandi, are half afraid of them (so long as they do not go into Nandi), as being rainmakers and magicians of no mean ability, a people who are, in fact, somewhat uncanny. Their external relations may be described under three heads as (1) acquisitional: exchange of goods and services with the Nandi, and, till about 80 years ago, with the Vasin Gishu Masae; (2) restrictive: the Government raids them for taxes, and takes away their land, which leads to (3) an attitude of deep suspicion towards all Europeans, though they are driven by economic pressure to work for them.

Productive activities are concerned with the following:

A. *Food*: meat (by hunting and trapping), honey, wild plants, eleusine and maize (grown or obtained), milk, maize meal, salt and beer.

B. *Non-edible*: houses, weapons, implements, utensils, clothing and ornaments (except of iron), firewood, traps, honey-barrels, coloured earth (which is dug in the eastern part of the forest and sold to the Nandi for cash.)

C. *Raw Materials*: wood, plants, and skins.

The exchange of their own products for things they do not make is governed by natural resources,

[P.194, B]

261
[548]

or working for it; (3) by prostitution.

Eleusine is made into beer as well as eaten; honey provides both food and intoxicant (*kipketinik*), and salt is made by burning the leaves of *tepeŋgwet* (*aemilia integrifolia*). 273 262 263

Fig. 1 shows a clan-settlement, and the division of the *imbaret* among the four households which form it. 361 614

The relationship between the various members of this settlement is shown in the table on page 195. ^{1} ^{2}

^{1}, ^{2} [see category 116, pp. 194 (c), 195 -- Analyst]

important aspect is, I fear, irrecoverable. I have been in the forest in both wet and dry seasons, and while trapping is still carried on, I could see no sign of hunting (i.e. shooting), and the description of a hunt is from narration.[1] Fear of a government which forbids hunting, and has of late itself hunted the Dorobo, has, I think, effectually sealed the lips of one or two who would normally have spoken on the subject. My informants, however, did say that sexual intercourse was forbidden before setting out on a hunt, though not before or during the process of trapping. In hunting there is an element of personal danger and of uncertainty as to success; magic helps to give confidence, and abstinence to avert ill-luck. In trapping the process is mechanical, largely a matter of technological skill, and with little danger to the trapper, who is sure to catch something sooner or later.

On the other hand, it is believed that both *Asis* (god) and the *chesowiloi* (both the good ancestral and the bad elemental) can influence a man's hunting, and before starting out to set a trap, he will say:

Asis, ipiiyech panyek,
God, give-us-enough meat,

or,

Chesowilōk, okōnech tiony ne kipare.
The-spirits, give-us a-beast which we-may-kill.

Honey (*kumiat*) is an important article of Dorobo diet, and provides both food and intoxicant: it is to them what milk is to a pastoral people. It is not stuff that can be picked up anywhere, but requires a certain technique, and, above all, the presence of bees in a suitable place. As, therefore, it has an actual social value, so it has acquired a ritual value, and certain observances are necessary if the supply of honey is not to fail. First, you must have your bees, and a man who has put up a new honey-barrel must take steps to ensure that it is inhabited. This he does by calling out, in an unnatural high-pitched voice, "Bees, bees, all you who are in this country, Come now and make honey here."

[1] Leopards, as already mentioned, are killed occasionally when they become aggressive and threaten livestock; but there are no organized leopard hunts, and in any case leopards are vermin.

[P.197, A]

000
262

come now and make honey here." Then, blood and fruit must not be eaten on the same day as honey, nor must bits of the comb be left lying about; they must be carefully covered up. The first of these prohibitions is analogous to the Nandi avoidance of meat and milk on the same day; the second, though the Dorobo say it is done "so that other people shall not see it," is also due to the ritual value of honey, and the consequent necessity of showing respect towards it.

In the ritual treatment of certain actions the use of certain materials is essential if the ritual is to be effective. Thus, a homicide must be rubbed with *eiyat*, the undigested grass from the stomach of a goat or sheep, and he must also be oiled with 'butter' (milk shaken in a gourd till it has gone oily and semi-solid); an unmarried girl who has had a child must also be rubbed with *eiyat*; a sick person whose illness is due to witchcraft must be oiled with goat's fat or butter; and a man who has killed an enemy must paint his face with five stripes of white earth—one across the forehead.

/13 cont./

MD 142 eyes are almond-shaped, straight or somewhat slanted. The nose is extended, narrow, and, at the root, flat or very moderately deep-set compared to the forehead. The alae are narrow and very flat, the nostrils roundish to longitudinally oval, less often transversely oval. The bridge of the nose is straight, sometimes slightly convex. The lips are full, without appearing actually protruding. Protruding, thick lips are something so rare and striking that they earn their owner the name Lebeleb -- thick lip (or actually: uproar, loud noise). The ears are small, except for the hyperplasia of the upper edge of the ear and ear lobes caused by the wearing of heavy ornaments. The hair is evenly distributed over the scalp, which is most clearly shown on recently shaved heads. The hair often appears "tufty," but this is artifically produced. Only at a length of from one to three centimeters does it curl slightly and /14/ almost never becomes completely curly. The arms and especially the legs are very long, the wrists thin, hands and feet, especially among female individuals, small, narrow, and delicate, the fingers are slender and often strikingly long and narrow, the fingernails long, narrow, and slightly arched.

MD 619 174 Even if the racial membership of the three branches were to be traced anthropologically, one can determine an even closer connection ethnographically, which must lead to the conviction that all three belong to the same people. The difference in their principal occupations, to be sure, seems at /Ill. 3 appears here/ first glance to indicate a sharp division. As has already been pointed out above, however, one can easily explain these differences by the consistent behavior of a people of similar customs and habits under unlike external circumstances. The predilection for stock raising, based on the eagerness for a meat diet, and the nomadic life necessarily growing out of it were common. While the Wandorobo had to endure it when their livestock fell victim to epidemics and raids of the strong Wakuafi, the latter, under pressure from the still mightier Masai, had to flee from the open plains to fixed residences in the mountains. The Wakuafi protected

/15/ Even though, in general, one should be very careful in ethnology about drawing conclusions from linguistic bases, it seems permissible here, on behalf of the three branches' belonging to one people, to point to their language as well.

As a matter of fact, we find the same language among the Masai and Wakuafi, with the limitation that for the latter, with the great number of Masai dialects, sometimes this one, sometimes that one is their own, according to the location of their area, whereas the very widely ranging Masai probably understand almost all the dialects. In addition, for the Wakuafi, in places, according to the degree of their mixture with Negro tribes, a language of the latter's is more or less familiar. Of the Wandoróbo, the El gasurek speak only the language of the Masai, whereas the Asá and

D
197

/232 cont./

262 If lean times then come, one tries, as well as one can, to appease
the stomach with wild roots or tubers, with berries or other small
[252] fruits, with honey and honey beer. Meat is seldom eaten raw,
usually boiled or roasted at the open fire. For storage it is cut into
251 long strips that are hung to dry in the sun. When the meat is well
439 dried, it is stowed away in the aforementioned tree, close to the
231 camp; cattle and small livestock, which are bought from the Masai
for ivory, are not kept, but slaughtered immediately. Insofar as the
262 Wandorobo, in barter with sedentary tribes, are able to come into
[439] the possession of vegetables, they also live on these, but actually
only during times when, for some reason, only little game is to be
had. Otherwise the vegetable food acquired by trade constitutes
only a side dish, especially for woman and children. Many of them
[272] detest milk and base this on the fact that their stomachs, accustomed
only to meat diet from early childhood, do not tolerate it. Some
go so far as to throw away the udder of a slaughtered cow, although
[171] they eat that of a slain piece of game. There indeed seems to be no
doubt but that the previously mentioned Masai belief, according to
which milk and meat must not be brought together, rests on these
273 customs. Besides water, honey beer, which they make in the same
[201] way as the Masai, also serves them as a beverage. The latter prize
[171] that made by them more than their own, which probably rests on the
fact that the Wandorobo keep the good honey for themselves and sell
264 only the inferior kind. Men, women, and children eat together.
[252] Both the foods for the man, his wives, and children and, on the other
hand, those for the youth and his favorite girl are cooked in one pot.
[415] From this the food is poured into small wooden bowls (kitokog), of
273 which each adult sharing in the meal has his own. From the food
171 laws of the Masai, the custom that young unmarried men may not
drink honey beer is still found here as a survival. Tobacco is a
276 luxury of the married. Men smoke it, coarsely cut, in pipes carved
by themselves. Ground to powder and mixed with a little steppe
salt and /233/ fat, it serves both men and women for snuffing.
Women also like to chew the snuff.

/249 cont./

224

merker phot.

Ill. 61. Wanderobo cutting up a hippopotamus.

From time to time battue hunts are also organized. For this, people like to choose a region where two small streams prevent the game from breaking out laterally to the battue direction. Already at sunrise the game has been surrounded at the rear, and, to be sure, by boys and young men, who now, by shouting and waving scraps of cloth or leather, which are tied to the bow sticks, drive it toward the row of archers, who have buried themselves up to the hips.

A sportsmanlike practice of hunting is completely foreign to the people. Unscrupulously they shoot the calf and the gravid mother animal. The sole purpose of their hunting is to obtain meat. They do not use nooses, pits, spring guns, and traps, for in this way slain game would only /250/ fall prey to predatory animals. The extermination of the vermin is also little to their liking. They loathe its meat -- only the Wandorobo living on the Donjo Kissale are said to eat lions occasionally -- and its extermination seems unnecessary to them in view of the huge multitudes of the constantly changing game. Only the predatory animals dangerous to human beings, primarily the lion, leopard, and hyena, are shot if one happens to encounter them. If a lion makes the surroundings of the camp

[262]

/250 cont./
224 unsafe for several days, the men lie outside the latter in wait at night.

Ill. 62. Wandorobo cutting up a hippopotamus.

in order to kill it with spears. They do not consider it possible to kill it by laying out meat bait in which arrow poison has been put. Several persons maintained that they had tried it in vain and believe that the lion smells the poison.

As far as the quality of the game is concerned, they are otherwise very easily satisfied. They no more scorn the coarse-fibered 224 meat of the heavy pachyderms than the high flavor of an elephant 262 carcass several days old, which even /251/ their giant stomach could not master at the first attempt. Like the predatory animals,

/231 cont./

224 they particularly value the entrails and also do not scorn the meat of
822 fallen or stricken animals; indeed, even the skin of elephant, rhinoceros, and hippopotamus is eaten roasted. As huntable, i.e., here
[223] edible, the Wandorobo regard elephant, rhinoceros, hippopotamus,
[439] pigs, zebras, all cloven-footed animals from the giraffe to the tiny dwarf antelope, hares, rock rabbits, and, of the birds, the ostrich, which, however, they shoot only on account of its feathers, which the Masai like to buy for the manufacture of the war head-ornaments. They do not hunt monkeys and lower animals, because they do not relish their meat.

224 On the day before the new moon, and in places also on the seventeenth day, the ol onjugi, no one goes hunting because, according to popular belief, one would not kill anything on the former day, wherein on the latter the bow would break. The red-headed Anaplectes
[825] melanotis is regarded as unlucky for the hunter. If the hunter sees it
[777] along the way he returns to camp immediately and does not leave it again until several hours later, in order to try his luck anew.

561 Like the warriors of the Masai, the dobunog of the Wandorobo also
264 hold their meat meals in the forest. Whereas among the former,
171 however, these are a result of the food rules, according to which the
[778] warrior may not eat meat in the kraal, among the latter it is only a matter of observing an ancient custom for which there is no longer any reason today, since the unmarried man usually eats his meat food in the hut. On the other hand, there is greater justification for retain-
[268] ing the en dorik, where they strengthen themselves by a plentiful
[229] eating of meat for a larger hunting expedition for more distant and at the same time dangerous game, such as elephants and buffalo. The
[263] many spices and stimulants that we become acquainted with among
[276] the Masai are also used by the Wandorobo, but to a far lesser extent. They do not divide up into fellowships for the meals in the bush, but
561 only for the hunting expeditions. Each company, as a rule, consists
224 of four men and is called e sirdg, in which one recognizes the present Masai word es sirit. The booty is divided among the participants in
[974] equal parts. If an individual hunter or an e sirdet spends the night in a strange camp, the host is given a foreleg and a hind leg of the hunting booty.

1:Huntingford E-4, 5 (1938-1939) 1953 FL6 Dorobo FL6

412 find lying about on the farms. The only weapon is the bow, *kwyagda*, which the
411 Dorobo make themselves from the *kwiot* tree (*Ilex* sp.); it is about 5 ft. long, and
[439] the bowstring, *iust*, is made from gut of the giant pig, *tumda*. Arrow-shafts are
378 made from the *kerowandet* and *masaita* trees, or from bamboo, *sosoiyat*; arrow-
heads are bought from the Nandi, and are of the Nandi patterns. Arrows are carried
in quivers made of hide. Arrow poison is made from the *keliot* bush (*acocanthera Schimperi*).

Baskets

415 Making baskets, *kwepet*, is a common occupation of Dorobo women. They are
[462] made from fibre of the *phoenix reclinata* palm, *sosiot*, and sewn with heat made from
[124] a plant called *teperwiot*. The technique is a spiral foundation with a flat then
285 gradually ascending coil, of the simple over-sewn type and bee-skep variety, the
stitches being spaced out and not close together.

Miscellaneous

317 Salt used to be made from the ashes of the plant *teperguet* (*amilia integrifolia*).
[263] Red and white earth is found near Timboroa on the east of the Dorobo country, and
men go in parties of four or five to dig it, carrying home the earth in large leather
[439] bags, mainly in order to sell it to the Nandi who, in 1930, gave them 2s. a bag.
[304] Red earth, *orokait*, is mixed with fat or simsim oil for rubbing on the hair; white
415 earth, *sosoiot*, [illegible] For carrying a number of small objects a
417 carrying-net called *kibandet* is used; it is made of a pair of oval rims 3 ft. 6 ins. long
with pieces of lions stretched across them, somewhat resembling a pair of handleless
tennis rackets. These are sometimes used by the Nandi.

Ritual and Beliefs

Religion

996 *Asista*, the sun, is recognized as a being that can supply or withhold the needs
of people: *Asis, ajaiyet paneyek*, "*Asis*, fill us with meat," is a common prayer.
Some say that *Arwoa* the moon is his sister, others that she is his mother. Besides
Asis, it is believed that there is a being called *Ilet*, the thunder, who produces rain,
and "the rainbow is his arm which draws up water for him." The Dorobo also
believe in spirits, good and bad, both of which are called *ereoniki*, a word which
includes the *oik* (ancestral spirits) and *mesambwanik* (evil spirits) of the Nandi. The
995 ancestral spirits have the same significance and functions as those of the Nandi, and
though they punish the living for doing evil, they are otherwise friendly and visit
the living, travelling in the bodies of snakes, both to see their people and to get food
in the form of *kibomek* (honey and water); spirit-snakes should not be killed.

Divination

959 The Dorobo appear to have no diviners of their own, and when they have
[276] recourse to divination, as in cases of illness or witchcraft, they go to Nandi diviners
of the type called *sekenyet*, by whom they are charged a small fee. The people
159 called *orkonyot* (pl. *orkonik*) among the Dorobo are no more than leeches or physicians
789 who prepare healing medicines from trees and plants. Although the Dorobo have a
reputation among other tribes as powerful rain-makers, they themselves say that they
have no rain-makers, which is probably true.

Death and Burial

964 Very old men and women are buried in narrow holes about 5 ft. deep in which
the bodies are laid full length wearing their clothes; one year after an old man's
death his children plant a branch of *mukuyuet* (*Ficus* sp.) on his grave and let it
grow. Other people are laid out for the funeral, both sexes on the right side with

6:Huntingford E-5 (1938-1939) 1953 FL6 Dorobo FL6

The economic unit is the family, of whatever kind, elementary or domestic, living alone or within a group. The unit formed of a man, his wife, and their children can actually provide itself, under normal conditions, with most of its necessary subsistence, with a certain amount of help from those to whom they are entitled to turn for it. The first necessity is of course food. This is of two kinds, meat and vegetable, and the second sort is now both wild and cultivated, though formerly the Dorobo ate but little in the way of cereals; restrictions on hunting have now forced them to do so. In the old days meat and honey were the principal foods, vegetables being eaten as a relish. The foods now eaten may be classed under the following heads in order of traditional importance:

1. Meat: got by hunting and trapping.
2. Honey: from their honey-barrels.
3. Wild plants: collected.
4. Salt: made or bought.
5. Drink: made from honey.
6. Cereals: eleusine and maize, grown; maize, bought.
7. Milk: for those who have cows.

Almost any kind of meat, except that of scavengers like jackal, hyaena, mongoose, etc., was and still is eaten, including antelopes, monkeys, and bigger game. Of antelopes they eat the following:

Ngemuwyot, the common duiker (*cephalophus Grimmi*).
Kipsukesei, the blue duiker (C. aequatorialis).
Mindit, the red duiker (C. igna-issaci).
Kavemaiit, the bushbuck (Tragelaphus scriptus).
Irukutet, the reedbuck (Cervicapra arundinum).
Kenyelet, the oribi (Ourebia montana).
Kipsomerot, the waterbuck (Cobus ellipsiprymnus).

Of monkeys they eat:

Sairet, the colobus (Colobus guereza).
Tisiet, Sykes' monkey (Cercopithecus albogularis).
Ceveret, grey monkey (C. griseo-viridis).
Komokut, the baboon (Papio cynocephalus).

And of other animals they eat:

Tuvut, the wild pig or wart-hog (Phacochoerus aethiopicus).
Tumta, the giant pig (Hylochoerus Meinertzhageni).
Maiito, the leopard.
Sombit, the lion.
Soiat, the buffalo.
Peliot, the elephant.

There are, however, no elephant in the Dorobo country to-day, nor have there been within living Dorobo memory; but buffalo still occur in the

6:Huntingford E-5 (1938-1939) 1953 FL6 Dorobo FL6

eastern part of the area and towards Londiani. Monkeys and pigs are found both in and outside the forest; leopards live on the edge, and lions are still occasionally met with in the open country near the forest. Antelopes are still found, but they are not so plentiful as they used to be.

Honey is produced in honey-barrels. This constitutes a special department of Dorobo life, and will be described in § 2 below.

Wild vegetable foods which grow in and round the forest are eaten both cooked and raw as relishes or additions to the staple diet of meat and cereals; the task of collecting vegetable food is usually performed by the women. Recorded wild foods eaten are:

Fruit of the *sitotik*, which are something like white currants, dried in the sun and eaten raw.
Fruit of the plant *momonyat*, rubus rigidus.
Fruit of the *lemeiyuet*, ximenia americana.
Fruit of the *sasuriet*, Musa ensete, the wild banana.
Leaves of the *siwot*, girardinia condensata, nettle.
Sap of the wild banana, eaten in place of what the Nandi call *kimiet* or 'porridge'.

Banana sap is collected by sticking a flat piece of wood into an incision made in the stem of the tree; a receptacle is hung on the end of the wood and left there for the sap to drip into it. The fruit of the wild banana (a very poor substitute for the cultivated kind) is placed on the drying tray (*sainet*) over the fire till it is roasted by the heat, and is then broken up with two stones and chewed; it is very hard. Tobacco is bought from the Nandi.

Before trade salt was obtainable through the Nandi, the Dorobo made a substitute from the leaves of the *tepenguet* bush (aemilia integrifolia) and of the *serenguet* tree. Leaves were burned, and the ashes collected in a suitable receptacle, a little water was poured on them and mixed, and the resulting liquid was added to food as needed. Some of the Bantu Kavirondo used to make a similar substitute for salt.

Intoxicating drink is chiefly made of honey, though now a little eleusine beer is made in the Nandi manner. The Dorobo method of making *kiptetinik* or *kumik ap lo*, "honey-wine", is as follows. As a fermenting agent, the seed-pods of the *rotinuet* tree (kigelia aethiopica or the sausage tree), which may be as much as a foot long and four inches thick, are boiled till quite soft when they are cut into strips and put into the honey to make it ferment. A Dorobo description of the process of making the drink is this:

Kenam rotik, kepele mat si kokerer;
They-are-taken the-seed-pods, they-are-boiled-on the-fire that they-may-be-split;
kiune ilosto si kipete tukuk ee somisec kul
they-are-washed-in the-river that they-may-be-lost the-things which-are dirty till
kepumbunit. Kema si keyomio. Kiinde teret
they-become-soft. They-are-put-in-the-sun that they-may-dry. They-are-put-into the-po
ole mii kumial puc, si kowuanit, kiinde eŋgarel
where there-is the-honey only, that it-may-become-bitter, there-is-put the-wate

6:Huntingford E-5 (1938-1939) 1953 FL6 Dorobo FL6

313 *Rerendet* (euphorbia candelabrum) : honey-barrels.
824 *Mocet:* honey-barrels.
Oltamiyoit or *Yemdit* (olive, olea chrysophylla) : fire-wood.
Enyasiek: fire-wood.
Coruet (ficus sp.) : fire-sticks.
Teet (cedar, juniperus procera) : fire-sticks.

824 (B) Plant material. The following trees and plants provide material for food, salt, medicines, and utensils*:

[372] *Sasiat* (dry grass) : tinder for making fire with fire-sticks.
[285] † *Tapariet:* fibre for baskets.
Sosiot (phoenix reclinata palm) : fibre for baskets.
[278] † *Tiinet:* medicine.
† *Opeito:* medicine.
Rerendet: medicine.
Lepuyuwet: medicine.
Sitotuet: medicine.
Seketet: medicine.
Usuet (ardisia sp.) : medicine.
● [263] *Tepenguet* (aemilia integrifolia) : salt.
Serenguet: salt.
[273] *Rotinuet* or *Rotiot* (kigelia aethiopica) : making honey-wine.

825 (C) Skins and animal products. These include :

237 † Monkey : food ; clothing.
[291] † Antelope : food ; clothing ; bags ; quivers.
[411] Pig-gut : bow-strings.
Feathers : arrows.
† Honey : food ; wine ; ritual purposes.
Ram's fat : ritual purposes.
[583] Goats : bride-payment ; ritual purposes.
Cattle : bride-payment ; milk ; dung ; hides.
[412] Bush-buck : tails for brooms.

285 The basket most commonly made by the Dorobo is the small *herepet*, about 6 inches deep and 6 ½ inches wide at the top. This kind of basket is used a good deal by the Dorobo themselves, and is also a frequent article [439] of sale or exchange to the Nandi : *kinapci hereponik Nandi*, "we make baskets [461] for the Nandi", as an old woman said. Dorobo women make baskets when they have nothing particular to do, just as European women knit. The materials used are fibre from the midrib of the *sosiot* palm, which is split into thin strips, and bast from a plant called *tapariet* which is used for sewing the coils of fibre with the aid of a small needle (Fig. 1). ¾ The basket maker starts by splitting the *sosiot* fibre, preparing a certain length and biting it off as she

[439] * Things marked with a dagger † are used in the preparation of objects given to the Nandi in exchange for their products.

Soiet (N.).—Buffalo.
Pëliot (N.).—Elephant.

262 Of other kinds of food, they eat bananas (*sllouriet* (N.), fruit (*e.g.* berries, such
137 as those of the momonyat (N.) plant, *Rubus rigidus*), nettles (*siuet* (N.), *Girardinia condensata*), and other wild products.

They make honey-barrels (*pasamat*, pl. *pasamik*; N. *masingat*) (Text-fig. 24), in which the bees swarm. The barrels are made either of rough slats of the tenetwet (N. *tenduet*,) tree, or of wide strips of thick bark. The ends of the barrels are made of circular blocks of wood, which keep the slats in place, the slats being bound outside with tree-rope. A hole large enough to admit the hand is left in the middle of the barrel and stuffed with a bunch of leaves. The barrel is placed on forked branches, the hole being in the under side. If the tree is a tall one, a pole is bound to it with tree-rope, by which the owner climbs to the barrel.

222 To take honey, the Dorōbo first makes fire in a loose ball of sasyat (fibre); he puts this under his garment, and taking some leaves of the kipsepuet (N.) tree[1] in which to wrap the honey, climbs up to the barrel. The sasyat is blown till it makes a good smoke, and the bunch of leaves having been removed from the barrel, the smoking sasyat is held to the hole in the barrel. Having waited a little, the Dorōbo inserts his hand and removes the honey-comb (*kipiriityet*) from the barrel, which he wraps in the kipsepuet leaves. Closing the hole, he descends, not worrying about any bee-stings he may receive.

● 264 In times of plenty, food is eaten in the morning, at midday, and in the evening. If there is no food, the people go hungry and wait till some is produced. The women

[1] *Tilia* sp.

3:Huntingford E-5 (1921-1928)1929 FL6 Dorobo FL6

prepare food and wait upon the men, themselves eating when the men have finished. At the present day the Dorôbo are taking to eating eleusine grain, which is crushed on grindstones (*litêto*, N.) and made into a sort of porridge; and milk, which they obtain from Nandi, if there are any near them. Beer is made from honey, and is called *kipketînik* (N.). Tobacco (*tumatet*, N.; or *chepkochûtit*,[1] N.) is bought from the Nandi, and is taken by men, and occasionally by women. It is either chewed (*mit*, N.) or smoked in Kavirondo pipes (*terênik-ap-tumatet*, or *kwesînik*, N.), which are also obtained from the Nandi. The men carry tobacco in cylindrical boxes called *kiprauwit* (N. *kipraut*) (Text-fig. 22), made from sosoiyat (bamboo), with skin coverings for the ends, to which are attached thin leather thongs, by which the box is slung round the neck.[2]

Agriculture and Stock.

Formerly the Dorôbo possessed no stock, nor did they till the ground. During the last quarter of a century or so a few of those living on the edge of the forest have taken to cultivating small plantations (*imbaret*, N.), in which they grow eleusine grain (*olbaiek*†, or *paiek*; N. *pâk*) only. A few possess, at the present day, one or two cows; others have a few goats and sheep; no one has more than 5 to 10 head. The only animals they possess in numbers are dogs.

Dress and Ornaments.

(i) *Males.*—Boys wear skins of antelopes and monkeys (*akuriet*; N. *inguriet*). Warriors wear skin garments of duiker (*ngemweyo*,[3] N.) called akuriet; they wear leg-bells attached to a leather band (*mpitiko*,[3] pl. *mpitikoîsiek*) on the ankles. Nowadays some wear pieces of cotton-cloth (*anget*, N.) dyed brown.[3] Old men wear bush-buck skins (*akuriet*) with the fur left on. Caps (*engeraiit*†) are worn, of blue duiker skin with the fur left on, by old men, and of cotton-cloth by warriors. Belts (*entoreit*†) of leather are worn by old men, and of beads by boys and warriors. Necklaces of chains (*sirimdo*, N.) or iron-wire (*asingait*, N.) are worn; also various kinds of iron ear-rings (*olaimeriat*† and *kimeitaiit* (Text-figs. 13–17); N. *kimeiteitiot*) are worn by warriors and elders.

(ii) *Females.*—The dress of the women and girls is very similar to that of Nandi women. They wear skirts (*chepkaiyuit*; N. *chepkawit*) and upper garments (*koliket*, N.), both of tanned leather, with the fur removed, in the same manner as the Nandi women. Their ornaments consist of iron-wire armlets and leglets (*makirorênik* and *karik*, N.), and wire necklaces (*asingait*, pl. *asingaîsiek*, N.). Married women wear

[1] *Chepkochutit* means "snuff" in Nandi.

[2] These are similar to the Nandi tobacco-boxes, from which indeed they are probably borrowed.

[3] As do the Nandi, from whom doubtless the custom spread to the Dorôbo.

6:Huntingford E-5 (1938-1939) 1953 FL6 Dorobo FL6

433 the absence of pastoral and agricultural techniques and vocabulary, by their myths, and in fact by everything about them. To-day it is true that they are becoming agriculturalists, as the following analysis of their economic activities will show:

			Past: →	Past: →	Ideal: (in most cases)
[462] [594]	Family	Men:	Trapping game in the forest	Cultivation of shambas	Stock
			Making weapons, honey-barrels, etc.		
			Some: working for wages		
		Women:	Preparing the results of trapping	Cultivation of shambas	
			Making baskets, skin clothes, etc.		
			Housework and food collecting		
[857]		Children:	Weeding		
			Herding		
			Housework		
[462]	Men Living Alone:		Trapping Making things Preparing the results of trapping Cooking, housework	Cultivation of shambas	Stock

[556] Dorobo life therefore converges on cultivation, with a hunting background, and stock in view as the ultimate achievement. For though the hunting instinct is still very much alive, and though a great deal of time is now spent on cultivation, there is no doubt that the Dorobo (in 1939 at least) had a livestock economy in their minds as the ultimate goal.

2. Economic Activities

a) Bee-keeping

262 [778] [231] 264 [789] Honey is to the Dorobo what milk is to the Nandi. It is semi-sacred and has a high ritual value, in consequence of which certain rules must be observed lest the supply fail. A person must not eat fruit or blood on the same day that he has eaten honey, though he or she may eat meat. After eating honey, bits of the comb must not be left lying on the ground, but must be hidden in the undergrowth. Arap Minis said, somewhat unconvincingly, that the reason for this was "that other people shall not see them and so be led to your honey-barrel". But this is probably not the true reason, which may be either simply respect to the honey, from a fear that if treated disrespectfully the supply will fail; or else fear of a witch putting a spell on the bees or honey

6:Huntingford E-5 (1938-1939) 1953 FL6 Dorobo FL6

through the piece of comb. After eating honey a Dorobo wipes his hands in the earth to clean them; whereas a Nandi uses leaves.

One of the accusations often made against the Dorobo as forest dwellers is that by burning grass and firing trees when taking honey they cause forest fires. Apart from the fact that there is no evidence to support this allegation, for the Dorobo do not burn trees, a very good reason why they do not destroy them was given by a Dorobo who said, with reference to some people in his settlement,

Kopel lakok ap Kapkolelac susuek ap timdannyon. Makicome
They-burn the-children of Kolelac-family the-grass of forest-our. We-do-not-like (it)
amu mepele Okiek timdo ne tinye tukuk ca kiomo,
for they-do-not-burn the-Dorobo the-forest which it-contains the-things which we-eat,
ngut ne mii pasanet ap sekemik:ngut kololio taptet ne
also where there-is the-honey-barrel of the-bees; also it-is-burned the-flower which
ome sekemik.
they-eat the-bees.

(The children of the Kolelac family are in the habit of burning the grass beside our forest. We disapprove of this, for the Dorobo do not burn the forest which contains the things they eat, and where they keep their honey-barrels; moreover, grass-burning destroys the flowers from which the bees get their honey.) The Dorobo in fact love their trees, and with these very practical reasons for not destroying them, it is absurd to accuse them of what amounts to an anti-social practice among themselves. Nor did the forest itself either in 1927 or in 1939 show signs of the alleged wanton destruction by fire attributed by some to the Dorobo.

Although wild honey is to be found in hollow trees and holes in rocks, the Dorobo do not rely on such chance finds for their supply, though they will eat it if necessary. They rely on the honey which they get from their own honey-barrels.

They recognize four varieties of bee:

Sekemik, social bees, Apis mellifera, the honey-producing bees which live in hollow trees and honey-barrels.

Imeiik, solitary bees, Osmia, which live in trees and hollow stems of shrubs and make honey.

Kosomek, earth bees, Halictus, slightly larger bees which live in holes in the ground and make honey.

Kiptulonik, mason bees, Chalicodoma, which live in cells made of a sort of cement formed of earth, minute stones, and their own saliva. These are very small bees, which make only a small amount of honey, and are not found in the forest, but in Soiin below the escarpment.

The Nandi word *kulumbenik* meaning another variety of bee, is used by the Dorobo, not of bees, but of small stinging insects like mosquitoes.

The bees that provide the Dorobo with their honey are the *sekemik*, of which there are, they say, three kinds: the queen, the workers, and the drones. The queen, *kamet ap sekemik* or "the mother of the bees", is

6:Huntingford E-5 (1938-1939) 1953 FL6 Dorobo FL6

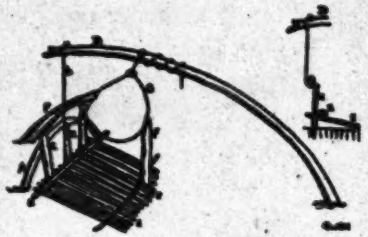

Fig. 5. A Simpler Kind of Springe. This trap has no "trigger-peg". The animal treads on the platform and by so doing presses it against the upright K to which liana *b* is attached, thus releasing the liana and allowing the bent stick D to spring upright and tighten the noose round the neck of the quarry.

when an animal treads on it, allowing the liana to slip over the top and thus release the bent stick D.

Hunting parties might be made up by as many as eight men, though I think that probably four or five was a more usual number. A common practice was for half the party to work along one bank of a stream and the rest along the other bank, so that if there was nothing on one side, those on the other side might be more successful; or if the quarry got across the stream, the men on the other side would be able to deal with it. When a kill was made, all the hunters assembled. The animal was skinned, the meat cut up, and some of it eaten on the spot, either raw, or partly cooked by laying it across a rough wooden framework over a fire. The rest of the meat was divided among them and taken home. In the best days, when meat was plentiful, what was left over was dried and kept either as a reserve or else exchanged with the Nandi for eleusine and millet. A stack of dried meat (*sirikeniot*) about 2 ft. square, was sold for about 25 lbs. of grain. Meat is cut into strips (*sir*, whence *sirikeniot*) which are laid out on the drying tray or loft over the fire to be smoke-cured after being dried on the roof of a hut or in the fork of a tree.

c) Agriculture

Since they can no longer hunt, and present conditions are[18] not favourable for the acquisition of cattle on a large scale (even if the Dorobo had the means of so doing), the adoption of agriculture has become an economic necessity, and methods, implements, and seed have been obtained from the Nandi. This change from hunting to agriculture has taken place virtually between the years 1927 and 1938. In the first of these years the area cultivated by them was so small as to be negligible; but by the latter year their lives were, as we have seen, to a great deal centered on agriculture. And as with hunting in the old days, so with agriculture to-day, the growing of crops is naturally regulated by the wet and dry seasons and the main divisions of the agricultural year are:

January to April: preparation of the land.
April-May: planting.
September: reaping.

[18] This refers to the years 1938-39.

hunted by concerted action, and still are, to a limited extent, by individuals, as well as several species of monkey.[1] There seems to have been no very strict close season, as pig were occasionally hunted in the wet weather, though not often, since the forest is difficult to traverse when wet. There are now no lion or elephant, but they are said to have existed when the Sawe and Kipkoiimet ages were young men, i.e. about 1860. Leopards are still common, and are still shot if one runs up a tree after being put up by dogs; they are sometimes caught in traps made of wire, which is not bought, but searched for or stolen from farms. However, a trap made by one Arap Megati which caught a leopard during one of my visits was said to be exceptional. Buffalo no longer exist in the western end of the forest where the Kapchepkendi live, but they occur near Londiani, a few miles to the east.

Hunting parties varied from two to eight men. If, say, eight went out, half would go along one bank of a stream, and half along the other bank, so that one or other party would be sure to get something. They met after the kill, and cooked the meat and ate some of it on the spot. The rest was divided among the hunters and taken home for their families, the unsuccessful members of the hunt receiving a share from those who made the kill. The hunter has to provide, not only his own (elementary) family, but also his father, mother, and wife's father with meat, and the distribution of meat in order of priority, is:—

Hunter:	*Meat to*
1.	Wife and children.
2.	Father and mother.
3.	Wife's father.
4.	Neighbours (clansmen).

A man has (or had till they were evicted by the government) an hereditary right over a piece of forest, which included hunting, trapping, bee-keeping, and food-gathering. Other people who wanted to hunt there asked permission to do so, for otherwise the right-holder might kill anyone

[1] *Saiwet*, Colobus guereza;

Tisiet, Sykes' monkey or Cercopithecus albigularis;
Konokchot, the baboon, Papio cynocephalus.

/231 cont./

621 [192] [171] to dobonog, i.e., huts of the unmarried men, in contrast to the aija to daĩma, the camp of the married. Therefore here, too, we find, even in the name, a separation into kraal of the married and kraal of the warriors, similar to the one mentioned for the Masai.

171 353 415 237 283 352 412 The arrangement of the interior of the hut, like the form itself, resembles that of the Masai; its furnishings, however, are even sparser. A honey pot (madjé, madjeog), a gourd bottle (mget) for drinking water and honey beer, a leather bag (lebenu, lebenua) for collecting honey, a larger one (ndaro, ndarerañg) for water, a few earthen pots, larger ones (idug, idia) and smaller ones (ruguba, ruguba) for cooking, a couple of wooden bowls (tagi), a rope cut out of an animal skin (scharu, scháruga) to tie up the slain meat, a cord twisted out of the bark fibers of the baobab (Adansonia digitata) for the drawing up and letting down of the beehives hung in trees (merihgo), along with a few dehaired skins (fulót) that serve as beds, as well as ax (haũo, hauergg) and knife (pandyug), constitute the 492 412 413 177 principal household equipment. In a few huts one also finds the en dereta /pack-holders/ of the Masai, here called lalaho (lelewgg), as well as a hammer (giribét) for forging and a chisel for designing the arrow points (mad, mara), and finally that sharpened small piece of sheet iron serving as razor-knife (herá, hereré). The entire family, 592 namely, husband, wife or wives, and the uncircumcised children, live in one /232/ hut. Men and boys, however, are usually out.

512 [224] [264] [825] The day begins even before daybreak for the hunting men. They set out with a snack consisting of a little piece of boiled or roasted meat, so that the first light of day already finds them in the hunting grounds. The game now behaves best; as they say, it then feeds more eagerly and carelessly than a few hours later, when the sun already becomes annoying to it. At daybreak women and children leave the huts; firewood and water are carried up in order to cook the meat fetched from a larder located in a nearby tree. The meat [251] is kept there and not in the camp, so that it hangs in the air and 512 thus remains fresh longer. After that the morning meal is eaten. 264 Actually the Wandorobo do not have definite mealtimes: as long as there is something edible they simply eat as long as they can.

/232 cont./

262 If lean times then come, one tries, as well as one can, to appease
the stomach with wild roots or tubers, with berries or other small
[252] fruits, with honey and honey beer. Meat is seldom eaten raw,
usually boiled or roasted at the open fire. For storage it is cut into
251 long strips that are hung to dry in the sun. When the meat is well
439 dried, it is stowed away in the aforementioned tree, close to the
231 camp; cattle and small livestock, which are bought from the Masai
for ivory, are not kept, but slaughtered immediately. Insofar as the
262 Wandorobo, in barter with sedentary tribes, are able to come into
[439] the possession of vegetables, they also live on these, but actually
only during times when, for some reason, only little game is to be
had. Otherwise the vegetable food acquired by trade constitutes
only a side dish, especially for woman and children. Many of them
[272] detest milk and base this on the fact that their stomachs, accustomed
only to meat diet from early childhood, do not tolerate it. Some
go so far as to throw away the udder of a slaughtered cow, although
[171] they eat that of a slain piece of game. There indeed seems to be no
doubt but that the previously mentioned Masai belief, according to
which milk and meat must not be brought together, rests on these
273 customs. Besides water, honey beer, which they make in the same
[271] way as the Masai, also serves them as a beverage. The latter prize
[171] that made by them more than their own, which probably rests on the
fact that the Wandorobo keep the good honey for themselves and sell
264 only the inferior kind. Men, women, and children eat together.
[252] Both the foods for the man, his wives, and children and, on the other
[415] hand, those for the youth and his favorite girl are cooked in one pot.
From this the food is poured into small wooden bowls (kitokog), of
273 which each adult sharing in the meal has his own. From the food
171 laws of the Masai, the custom that young unmarried men may not
drink honey beer is still found here as a survival. Tobacco is a
276 luxury of the married. Men smoke it, coarsely cut, in pipes carved
by themselves. Ground to powder and mixed with a little steppe
salt and /233/ fat, it serves both men and women for snuffing.
Women also like to chew the snuff.

/251 cont./

224 262 they particularly value the entrails and also do not scorn the meat of fallen or stricken animals; indeed, even the skin of elephant, rhinoceros, and hippopotamus is eaten roasted. As huntable, i.e., here [223] [439] edible, the Wandorobo regard elephant, rhinoceros, hippopotamus, pigs, zebras, all cloven-footed animals from the giraffe to the tiny dwarf antelope, hares, rock rabbits, and, of the birds, the ostrich, which, however, they shoot only on account of its feathers, which the Masai like to buy for the manufacture of the war head-ornaments. They do not hunt monkeys and lower animals, because they do not relish their meat.

224 On the day before the new moon, and in places also on the seventeenth day, the ol onjugi, no one goes hunting because, according to popular belief, one would not kill anything on the former day, [825] [777] whereas on the latter the bow would break. The red-headed Anaplectes melanotis is regarded as unlucky for the hunter. If the hunter sees it along the way he returns to camp immediately and does not leave it again until several hours later, in order to try his luck anew.

561 264 171 [778] Like the warriors of the Masai, the dobonog of the Wandorobo also hold their meat meals in the forest. Whereas among the former, however, these are a result of the food rules, according to which the warrior may not eat meat in the kraal, among the latter it is only a matter of observing an ancient custom for which there is no longer any reason today, since the unmarried man usually eats his meat food in the hut. On the other hand, there is greater justification for retaining [262] [224] the en doro, where they strengthen themselves by a plentiful eating of meat for a larger hunting expedition for more distant and at the same time dangerous game, such as elephants and buffalo. The [263] [276] many spices and stimulants that we became acquainted with among the Masai are also used by the Wandorobo, but to a far lesser extent. They do not divide up into fellowships for the meals in the bush, but 561 224 only for the hunting expeditions. Each company, as a rule, consists of four men and is called e sirder, in which one recognizes the present Masai word es sirit. The booty is divided among the participants in [574] equal parts. If an individual hunter or an e sirdet spends the night in a strange camp, the host is given a foreleg and a hind leg of the hunting booty.

FL6 Dorobo FL6

224 825 mind) made by placing the forefingers on either side of the nose and calling into the hollow formed by the palms of the joined hands.[1]

224 411 The *Mósiro* are fast and accurate bowmen at close range, and there are few of them who have not accounted for more than one lion with this weapon. A *Mósiroi* at present in my employ is credited with having killed thirteen lions thus, three of them with one arrow. The arrows, of course, are poisoned,[2] and are discharged with a force that would, I feel sure, excite the admiration of a European toxophilite. A curious, crouching attitude is adopted when drawing the bow-string and the archer faces his target, not adopting the more usual position of standing at a right angle to it. The killing of a lion with the bow is not regarded as an event of especial importance and the carcass is often left to rot in its skin.

261 If trouble is in the wind, the *Mósiroi* will always make for the haven he knows best—the bush. There he will live, apparently quite independent of the products of civilisation, and in nowise inconvenienced by a total lack of water, for weeks at a stretch, returning (when the trouble has blown over) with a skin bottle or bag bulging with honey. I could not understand the apparent ability of the *Mósiro* to live for long periods in country I knew to be waterless until I had been introduced to what they laughingly said was "the dry-season water." This is an enormous tuber[3] with a skin like the domestic potato. Under the skin is a milky, sticky layer about half-an-inch in thickness. This surrounds the inner core, which is of the appearance and consistency of a raw potato, is slightly fibrous and very moist. When this is chewed (the residue is not generally, but may be, swallowed), it gives great relief to thirst. Squeezing or pounding one of these tubers over a cooking-pot will result in the accumulation of a surprising amount of quite

[1] My predecessor at Kilaya shot two male lions which were "called" to a kill in this way by the *Mósiro*. He sat beneath a tree at a place where two lions had recently killed; the *Mósiro* mounted the tree and began calling. After a short time, one lion came to the kill (a goat) and was shot. The second lion came quite soon afterwards and was duly given his quietus.

[2] See the section devoted to Dorobo arms.

[3] This tuber, called *Kisherembara*, is also known to the Kisiba Masai and is called by them *Ol-Mondodua*. This is a corruption of the *Mósiro* name, and the Masai freely admit that they learned of its existence from the Dorobo.

[824]

FLA Dorobo FLA

palatable water. A full-grown specimen of this tuber must weigh many pounds, as I have seen them as large as a Rugby football. It is most difficult of detection, having only three or four small oval leaves above ground, but the *Móiro* seem to be able to find it anywhere. It is generally obtained by digging with a sharpened stick under certain bushes.

The majority of the *Móiro* (if not all) would seem to inhabit the southern half of the Tanganyika Masai Reserve. There are a few living in Handeni, but close to the southern Masai border and within a day's march of Talamai. North of L'ol-Kisale I have not met with *Móiro*, though I think there may be a few in the northern areas. There are some *Móiro* in the vicinity of Lo-sokoine. I imagine (though I do not assert positively) that the Dorobo living with the Masai west of the Rift Wall, in the Kotu-'n-beine localities and to the north of Lake Eyasi, are not *Móiro*, but are *Aramanik*.

Many *Il-Móiro* are members by adoption of the *'L-Aiser* and *Il-Mildyan* clans of the Masai, and some have been adopted into the *Il-Marumas* family of the *Il-Molkpusa* clan.

Since the above notes were written, I have met with certain *Móiro* whose housing methods are even more primitive than those already described. These people live in unpleasantly obstreperous "dug-outs" about eight feet below the ground. There is no ventilation, and the cave is generally scooped out beneath the roots of a baobab or other suitable tree. At night the entrance is securely blocked with thorns. The *Móiro* who live thus differ in no other respect from those already described and, amusingly enough, are much despised by their relatives for their troglodytic existence.

R. A. J. Maguire.

ripen till. It becomes like drink. (Then) we drink.

(Some wood-pods are boiled so that they can be split; they are washed in the river to remove any dirt sticking to them, and then when they have become quite soft, they are put in the sun to dry. The dried strips are next put into a pot containing honey and nothing else, to make it bitter, i.e. to ferment it, and some water is added. The mixture is put in the hut to ferment. It is left for several days till it is ready and can be drunk. Then we drink it.) Another drink called *kokwek*, or honey-and-water, is also a favourite of the Dorobo; it is not intoxicating and is much simpler to prepare than honey-wine, being simply honey and water mixed together, without the addition of wood-pods, and drunk the same day without any fermentation. 272 ●

In the old days, the Dorobo say, they were seldom absolutely without food, for meat could generally be got with either bow or trap, and unless a man was ill or away, when someone would help his family with food, he could usually get enough to feed them. This is probably true, for in those days game was plentiful enough, and there were no Europeans to restrict their hunting activities. Nowadays, when hunting is curtailed, and reduced to little more than trapping, there is an uncertainty about the food supply which even the introduction of agriculture and the presence of Europeans have not altogether removed. A man may be just unlucky with his trapping: European influence, an "harmful magic", is blamed for this; and his crop may be a small one, or much damaged by vermin. And although one member of a family may even be a wage-earner on a neighbouring farm and get a daily ration of 2 lbs. of maize meal when he works, he has to feed not only himself but his own family and perhaps others. For instance, a man of my acquaintance named Arap Kotet had to feed his wife, his child, his sister, and his mother, as well as himself. Arap Ruto, one of his neighbours, who also worked on a farm, had at times to feed his brother Arap Mutai, his wife, his four children, and his mother. Two pounds of meal a day do not go far to eke out a small crop and the produce of the traps and honey-barrels when divided among eight people is a bad season. Shortages are cancelled as far as possible by the principle of sharing, and a man who has food left over after feeding his own family must, and does, help to feed certain others if need be. Arap Ruto, as we have just seen, has had to feed seven people besides himself at times; but in the past the normal rule of food distribution was that a man provided meat for his wife and children, for his parents, and sometimes his wife's parents, since the old people, as always, depend on what their sons and sons-in-law can give them. A successful hunter also shared his kill with those who went with him and were unlucky. The distribution of meat was then as follows:

Hunter
1. Own family.
2. Own parents.
3. Wife's parents.
4. Fellow hunters.

/XVI cont./

262 If lean times then come, one tries, as well as one can, to appease
[852] the stomach with wild roots or tubers, with berries or other small
fruits, with honey and honey beer. Meat is seldom eaten raw,
251 usually boiled or roasted at the open fire. For storage it is cut into
939 long strips that are hung to dry in the sun. When the meat is well
251 dried, it is moved away in the aforementioned tree, close to the
camp: cattle and small livestock, which are bought from the Masai
262 for ivory, are not kept, but slaughtered immediately. Insofar as the
[939] Wandorobbo, in barter with sedentary tribes, are able to come into
the possession of vegetables, they also live on these, but actually
only during times when, for some reason, only little game is to be
had. Otherwise the vegetable food acquired by trade constitutes
• [872] only a side dish, especially for women and children. Many of them
never milk and base this on the fact that their stomachs, accustomed
only to meat diet from early childhood, do not tolerate it. Some
go so far as to throw away the udder of a slaughtered cow, although
[191] they eat that of a slain piece of game. There indeed seems to be no
doubt but that the previously mentioned Masai belief, according to
which milk and meat must not be brought together, rests on these
873 customs. Besides water, honey beer, which they make in the same
[870] way as the Masai, also serves them as a beverage. The latter price
[871] that made by them more than their own, which probably rests on the
fact that the Wandorobbo keep the good honey for themselves and sell
254 only the inferior kind. Men, women, and children eat together.
[852] Both the foods for the man, his wives, and children and, on the other
[915] hand, those for the youth and his favorite girl are cooked in one pot.
From this the food is poured into small wooden bowls (kitoboge), of
253 which each adult dining in the meal has his own. From the food
191 laws of the Masai, the custom that young unmarried men may not
drink honey beer is still found here as a survival. Tobacco is a
276 luxury of the married. Men smoke it, coarsely cut, in pipes carved
by themselves. Ground to powder and mixed with a little soapy
salt and /XIV/ fat, it serves both men and women for snuffing.
Women also like to chew the snuff.

l:Huntingford E-4, 5 (1938-1939) 1953 FL6 Dorobo FL6

other scavengers. Nowadays, all hunting activities are carried on illegally with the risk of being punished if caught by the police.

Weapons are the bow and poisoned arrows carried in a quiver. Knives are used to skin game and to make springes. Spears have never been used. The Dorobo used to have hunting dogs, but in the North Tinderet Forest the breed seems to have died out, though it existed in 1927. They have two kinds of trap: (i) The pit trap, *ngwet*, formerly used for buffalo, consisting of a pit 8 ft. long, 3 ft. wide, and 6 ft. deep, with wooden spikes set in the bottom. (ii) The springe or snare, *porowet*, which consists, briefly, of a springy stick bent over, with a noose attached to it connected with a platform: the arrangement is such that when an animal treads on the platform its head enters the noose, and the pressure on the platform releases the springy stick, which flies up, tightening the noose, and holding the animal suspended. Such traps can be made in less than ten minutes. This type is used chiefly to catch antelopes, but leopards have been caught in them. Cross-bar traps with a drop-spear were not used by the Kipkurerek Dorobo.

The only hunting taboo recorded is that the night before he goes out hunting a man must abstain from sexual intercourse. This does not apply to the setting of traps.

As regards land rights, the forest was divided into districts, *koret*, pl. *koroosek*, and in his district each man had an hereditary block of land in which he hunted, set traps, kept his honey-barrels, and collected wild food. Occupation rights were recognised by public opinion, and trespass on a man's forest area, i.e., deliberate entry in order to start hunting without permission or the promise of a piece of meat, might result in the trespasser's death at the hands of the owner, who would then have to pay compensation for homicide. Theft of game from a trap is said never to have occurred, not only because the thief might be killed, but because his belly would swell to a great size and he would die after eating meat stolen from a trap.

Bees

Honey is to the Dorobo what milk is to the Nandi: it is "sacred," and its supply must be protected by the observance of taboos. Fruit and blood must not be eaten on the same day as honey (though meat may be eaten); when a comb is emptied, it must be carefully hidden in the undergrowth; and after eating honey a Dorobo cleans his hands in earth, not (like the Nandi) by wiping them with leaves.

The Dorobo recognise four varieties of bee: *sekemik*, the honey-producing kind; *imoik*, solitary bees which live in trees; *koosoosik*, earth bees, which live in the ground; and *kipindowik*, mason bees, which live in cells made of earth and particles of stone cemented together by their own saliva. The Dorobo divide the honey-bees, *sekemik*, into three kinds: the queen, *kowet ap sekemik*, "the mother of the bees"; the workers, called simply *sekemik*, considered to be males, which make honey by eating the "sap" (*pek*) of flowers and then vomiting it into the empty honey-combs; and the drones, *kapsowaik*, considered to be idle females which do nothing useful.

Hives or honey-barrels (*panaosi*) are made either of slats of wood tied together, with circular wooden end-pieces; or of the two halves of a piece of log split longitudinally and tied together. They are set in trees, and when a new hive is put up, the owner calls the bees, in a high-pitched tone, to come and occupy it: "Bees, bees, from all the country, come here now, and pour in honey, pour in honey." Bees are said to recognise their owners by their body-smell, and do not sting them when taking honey. Certainly taking honey does not appear to be a painful or dangerous process to the Dorobo owner. Theft of honey from a barrel is considered very low, and a man might kill a thief, though he would have to pay compensation for homicide.

Honey is an important article in Dorobo economy: it is eaten as food, made into an intoxicant, used for ritual purification, and it forms an article of commerce.

1: Huntingford E-4, 5 (1938-1939) 1953 FL6 Dorobo FL6

AGRICULTURE

The Dorobo began to cultivate in a small way about 30 years ago (or even a little earlier) and at first they grew only eleusine. Though their inclinations were to become cattle-owners, conditions were unfavourable to the development of cattle-breeding as a primary activity and they have been forced to make agriculture a serious business; for the methods, implements, and even the seed used in this, they have been indebted to the Nandi.

Land

Those who live in A and B domicile categories (with whom alone we are concerned here) cultivate small plots in the open land which surrounds the forest. They have no rights of tenure, except the temporary ones acquired, according to Kenya law, if they live there as squatters under the Resident Native Labourers Ordinance. Their plots, *imbarsit*, pl. *imbaresik*, range in size from one acre divided into four individual holdings, to half an acre divided into four holdings; in other cases, plots of a quarter to one-fifth of an acre worked by one person. All plots are fenced, and sometimes a living-hut is built inside the fenced area; occasionally it was found that elderly Dorobo were allowed by Nandi squatters to have a little piece of their cultivated land to work.

European farmers in the district, with whom the Dorobo land question was discussed, seemed not unwilling to let the Dorobo live unmolested on their land, provided they gave no trouble; but the government authorities thought otherwise, and the position of a Dorobo who did not choose to become a squatter in order to live on what he considered his own land was thus precarious.

Cultivation Methods and Crops

Two main crops are grown, eleusine, *paiek*, and maize, *ipandek*. Millet had not been grown by 1940, though they bought it from the Nandi. Sweet potatoes, *ropesonik* are sometimes grown in very limited quantities. Implements are the heart-shaped hoe and the panga or cutlass, both obtained from the Nandi. They have also stone axes, *ndobut*, and knives, *rotuet* or *cambolust*.

The sowing of crops is regulated by the dry and wet seasons, *muaisonik*, from October to March, and *iwotet*, from April to September. The land is prepared between January and April, and planted in April or May according to the rain. Cultivation follows the Nandi method, with paring and burning of new land. The seed of eleusine and maize is bought from the Nandi, usually from squatters living nearby. Maize and eleusine are planted together in the same plot, though potatoes are generally grown separately. Eleusine is reaped in the Nandi manner by cutting off the heads; maize is picked by hand. Granaries of Nandi type are sometimes made, but are seldom needed, as the yields are so small that the loft of a hut can generally hold all that is not eaten on the field (as is often the case with maize). Cereals are roughly ground on slabs of granite in the Nandi manner.

Food

Food in the old days consisted mainly of meat supplemented by honey, wild vegetables and grain bought by exchange from the Nandi. The food supply is now based on their own agricultural produce, supplemented by milk when they have any, and by certain other foods when they can be got. Meat is still obtained by trapping, though seldom by hunting; it includes the flesh of antelopes, monkeys, pigs, and rodents. Honey is got, as already described, from honey-barrels. Wild food, collected in the forest, includes fruit of the *momoniat* (*rubus rigidus*), *kemsiyuat* (*rhoicissus americana*), and *sasuriet* (*musa sasota*, wild banana), the sap of the *sesuriet*, and leaves of nettle, *sinet*.

Intoxicating drink is of two kinds: the Dorobo honey-wine, *kiptotiosik* or *kumik* as in, made from honey, and fermented with the long seed-pods of the "sausage

1:Huntingford E-4, 5 (1938-1939) 1953 FL6 Dorobo FL6

[962] [213] tree," *rotinust* (*higelia æthiopica*); and *maiyeh*, eleusine beer, made, though seldom, in the Nandi way. They also drink a mixture of honey and water called *lokomek*.

Trade and Exchange

439 The inability of the Dorobo to produce many of the things they need has led to the development of a system of exchange with the Nandi, who till recently were almost the only people with whom they had dealings. Relations between Dorobo and Nandi have been such that, though maintaining their complete independence, [648] [177] the Dorobo have not only obtained goods by trade, but have acquired and assimilated much Nandi culture, including language, clan-names, agriculture, and many material features like dress and ornaments. Their relations are in general friendly, for the Nandi like honey and furs which they get most easily from the Dorobo, and [582] there has been an increasing number of marriages of Dorobo men with Nandi women, as well as of Dorobo women with Nandi men. But neither side takes liberties with the other: the Dorobo fear the physical superiority of the Nandi, and the Nandi [181] [186] fear the close-to-nature life of the Dorobo, as well as a certain mystical force as rain-makers which they attribute to them.

From the Nandi the Dorobo get objects of iron, pottery, beads, tobacco, cattle (see below, p. 61), and the seed of cereals for planting. The Nandi get skins and honey from the Dorobo. There are no special places for trade, but the Dorobo go to [437] the nearest smith or potter or other person who can supply them, and make their bargains. This means a journey into the Nandi Land Unit, but other things can be got from the nearest friendly Nandi. The exchange values in 1930 were:

[935]
1 axe for 1 bagful of honey;
1 bundle of tobacco (about 1 lb.) for 1 bagful of honey;
1 arrowhead for 1 gourd full of honey;
1s. worth of trade beads for a gourd full of honey;
1 knife for a day's weeding in the smith's garden;
1 large earthenware pot for 1 large prepared buck skin (usually bush-buck)
1 small earthenware pot for 1 small prepared buck skin (usually duiker);
2 baskets of seed for planting for 1 new basket.

[915] The bag, *motoket*, is made of skin and measures about 8 ins. by 7 ins.; the gourd is about 10 ins. long; the large pot is about 20 ins. high, the small pot about 10 ins. high; and the basket is about 6 ins. deep and 6 ins. wide.

Cattle

231 The Dorobo interest in cattle is probably due to their long contact with the Nandi; but though they desire cattle, they have not the land for them. Yet they [177] have speculated about cattle inheritance, and by 1939 had worked out theoretical rules which they had scarcely had opportunities of testing. When they were evicted from the forest in 1937 they were officially credited with about 2,000 head of cattle; [648] but no census of either people or stock appears to have been made in preparation for this event, and most of these cattle did not belong to real Dorobo. In 1938–9 the numbers of stock which I counted during the compilation of my census were:

	Cattle	Goats	Dogs
Koret of Kipkorom ..	25	15	4
Koret of Sosoiyo ..	54	19	3
Koret of Kelpai	11	0	0
	90	34	7

[171] Methods of cattle-management are based on those of the Nandi.

3:Huntingford E-5 (1921-1928)1929 FL6 Dorobo FL6

prepare food and wait upon the men, themselves eating when the men have finished. At the present day the Dorôbo are taking to eating eleusine grain, which is crushed on grindstones (*listo*, N.) and made into a sort of porridge; and milk, which they obtain from Nandi, if there are any near them. Beer is made from honey, and is called *kipketînik* (N.). Tobacco (*tumatet*, N.; or *chepkochûtit*,[1] N.) is bought from the Nandi, and is taken by men, and occasionally by women. It is either chewed (*mit*, N.) or smoked in Kavirondo pipes (*terônik-ap-tumatet*, or *kweînik*, N.), which are also obtained from the Nandi. The men carry tobacco in cylindrical boxes called *kiprauwit* (N. *kipraut*) (Text-fig. 22), made from soseiyat (bamboo), with skin coverings for the ends, to which are attached thin leather thongs, by which the box is slung round the neck.[2]

Agriculture and Stock.

Formerly the Dorôbo possessed no stock, nor did they till the ground. During the last quarter of a century or so a few of those living on the edge of the forest have taken to cultivating small plantations (*imbaret*, N.), in which they grow eleusine grain (*olbaiek*†, or *paiek*; N. *pâk*) only. A few possess, at the present day, one or two cows; others have a few goats and sheep; no one has more than 5 to 10 head. The only animals they possess in numbers are dogs.

Dress and Ornaments.

(i) *Males.*—Boys wear skins of antelopes and monkeys (*akuriet*; N. *inguriet*). Warriors wear skin garments of duiker (*ngemuuyo*,[3] N.) called akuriet; they wear leg-bells attached to a leather band (*mpitibo*,[3] pl. *mpitikoîsiek*) on the ankles. Nowadays some wear pieces of cotton-cloth (*anget*, N.) dyed brown.[3] Old men wear bush-buck skins (*akuriet*) with the fur left on. Caps (*engeraiit*†) are worn, of blue duiker skin with the fur left on, by old men, and of cotton-cloth by warriors. Belts (*entorriit*†) of leather are worn by old men, and of beads by boys and warriors. Necklaces of chains (*sirimdo*, N.) or iron-wire (*asingait*, N.) are worn; also various kinds of iron ear-rings (*olaimeriat*† and *kimeitsiit* (Text-figs. 13–17); N. *kimeitsitiot*) are worn by warriors and elders.

(ii) *Females.*—The dress of the women and girls is very similar to that of Nandi women. They wear skirts (*chepkoiyuit*; N. *chepkowit*) and upper garments (*koliket*, N.), both of tanned leather, with the fur removed, in the same manner as the Nandi women. Their ornaments consist of iron-wire armlets and leglets (*makirorînik* and *karik*, N.), and wire necklaces (*asingait*, pl. *asingoîsiek*, N.). Married women wear

[1] *Chepkochutit* means "snuff" in Nandi.

[2] These are similar to the Nandi tobacco-boxes, from which indeed they are probably borrowed.

[3] As do the Nandi, from whom doubtless the custom spread to the Dorôbo.

5:Huntingford E-5 (1938-1939) 1954 FL6 Dorobo FL6

and speak at it. People meet at the house of a clansman who, upon notice being given to him, prepares as much honey-wine as he can for the entertainment of the gathering, and what he provides may be supplemented by wine brought by other members. The business of the council is done with the aid of a jar of honey-wine in an informal way as if it were a social gathering, which in a sense it is, for the clan council through its informality has become a social bond between clansmen. Business is done first, and the drinking soon follows. The subjects which may be discussed include:

1. Disputes between members of the clan.
2. Hunting disputes.
3. Disputes about boundaries of hunting areas.
4. The preliminary business when a clansman has killed a member of another clan.
5. Homicide within the clan.
6. Sexual intercourse between a man and a girl of the clan. Disputes under heads 1-3 are settled by discussion, the leader of the council swaying, by his opinion, the views of the members. The leader, *kiruokindet*, is not necessarily the oldest member of the clan, for such a man might be too senile to act properly; but someone fairly senior in age, with his faculties intact, who is liked and respected, becomes in course of time (as in the case of the leader of the *koret* council) looked upon as a responsible person who can be safely listened to and whose judgement is sound.

More serious matters, like those under heads 4-6, are dealt with like the rest by discussion, but there is as well a certain traditional procedure to follow. When a clansman has killed a member of another clan, the council of the dead man's clan meets to discuss the compensation payable, and to choose a messenger who will be sent to the council of the murderer's clan to start proceedings, which after a preliminary discussion, are heard before the *koret* council, since two different clans are involved, and the matter is not purely the affair of one clan. When a man kills a member of his own clan, the whole matter is settled within the clan. First, the murderer has to brew some honey-wine and kill a goat from which the fat is collected. Then old men of both the families concerned meet at the house of the murderer and drink the wine he has provided, after which two of the old men oil the murderer all over with the goat's fat. The animal from which this fat is obtained must be a goat, and if the murderer has none of his own, he must get one by purchase or theft. He is therefore put to some trouble and even danger, for if he has to steal a goat he risks being speared if caught, and this constitutes an act of faith which, together with the anointing of his body, frees him from the uncleanness caused by the shedding of human blood. There is no payment of compensation for the murder of a clansman, but the murderer must if he can give his victim's wife one cow to help towards her maintenance. This last is a Nandi custom and was probably introduced in recent times after the Dorobo had begun to acquire cattle in a small way.

Sexual intercourse between a man and a girl of his clan is not an offence provided the girl does not have a baby, though the lover is not allowed

6:Huntingford E-5 (1938-1939) 1953 FL6 Dorobo FL6

eastern part of the area and towards Londiani. Monkeys and pigs are found both in and outside the forest; leopards live on the edge, and lions are still occasionally met with in the open country near the forest. Antelopes are still found, but they are not so plentiful as they used to be.

Honey is produced in honey-barrels. This constitutes a special department of Dorobo life, and will be described in § 2 below.

Wild vegetable foods which grow in and round the forest are eaten both cooked and raw as relishes or additions to the staple diet of meat and cereals; the task of collecting vegetable food is usually performed by the women. Recorded wild foods eaten are:

Fruit of the *sitotik*, which are something like white currants, dried in the sun and eaten raw.
Fruit of the plant *momonyat*, rubus rigidus.
Fruit of the *lemeiyuet*, ximenia americana.
Fruit of the *sasuriet*, Musa ensete, the wild banana.
Leaves of the *sinot*, girardinia condensata, nettle.
Sap of the wild banana, eaten in place of what the Nandi call *kimiet* or 'porridge'.

Banana sap is collected by sticking a flat piece of wood into an incision made in the stem of the tree; a receptacle is hung on the end of the wood and left there for the sap to drip into it. The fruit of the wild banana (a very poor substitute for the cultivated kind) is placed on the drying tray (*saiuet*) over the fire till it is roasted by the heat, and is then broken up with two stones and chewed; it is very hard. Tobacco is bought from the Nandi.

Before trade salt was obtainable through the Nandi, the Dorobo made a substitute from the leaves of the *tepenguet* bush (aemilia integrifolia), or of the *serenguet* tree. Leaves were burned, and the ashes collected in a suitable receptacle, a little water was poured on them and mixed, and the resulting liquid was added to food as needed. Some of the Bantu Kavirondo used to make a similar substitute for salt.

Intoxicating drink is chiefly made of honey, though now a little ekuuine beer is made in the Nandi manner. The Dorobo method of making *kiptetinik* or *kumik ap lo*, "honey-wine", is as follows. As a fermenting agent, the seed-pods of the *rotinuet* tree (kigelia aethiopica or the sausage tree), which may be as much as a foot long and four inches thick, are boiled till quite soft when they are cut into strips and put into the honey to make it ferment. A Dorobo description of the process of making the drink is this:

Kenam rotik, kepele mat si kokwer;
They-are-taken the-seed-pods, they-are-boiled-on the-fire that they-may-be-split;
kiune ilosto si kipete tukuk ee somisee ku/
they-are-washed-in the-river that they-may-be-lost the-things which-are dirty till
kepambunit. Kema si keyomio. Kiinde teret
they-become-soft. They-are-put-in-the-sun that they-may-dry. They-are-put-into the-po
ole mii kumiat puc, si kowunit, kiinde ee eigeet
where there-is the-honey only, that it-may-become-bitter, there-is-put the-wate-

6:Huntingford E-5 (1938-1939) 1953 FL6 Dorobo FL6

hopotok. Kiinde tapat kut korurio. Peni-e ekosiek ee can si korurio 273
so-well. It-is-put-in the-loft till it-ripens. It-remains the-days many that it-may-
kut koiek maiyak. Kiie.
ripen till it-becomes the-drink. (Then) we-drink.

(Some seed-pods are boiled so that they can be split; they are washed in the river to remove any dirt sticking to them, and then when they have become quite soft, they are put in the sun to dry. The dried strips are next put into a pot containing honey and nothing else, to make it bitter, i. e. to ferment it, and some water is added. The mixture is put in the loft to ferment. It is left for several days till it is ready and can be drunk. Then we drink it.) Another drink called *lokomek*, or honey-and-water, is also a favourite of the Dorobo; it is not intoxicating and is much simpler to prepare than honey-wine, being simply honey and water mixed together, without the addition of seed-pods, and drunk the same day without any fermentation. 272

In the old days, the Dorobo say, they were seldom absolutely without food, for meat could generally be got with either bow or trap, and unless a man was ill or away, when someone would help his family with food, he could usually get enough to feed them. This is probably true, for in those days game was plentiful enough, and there were no Europeans to restrict their hunting activities. Nowadays, when hunting is curtailed, and reduced to little more than trapping, there is an uncertainty about the food supply which even the introduction of agriculture and the nearness of European farms does not altogether remove. A man may be just unlucky with his trapping: European influence, as "harmful magic", is blamed for this; and his crop may be a small one, or much damaged by vermin. And although one member of a family may even be a wage-earner on a neighbouring farm and get a daily ration of 2 lbs. of maize meal when he works, he has to feed not only himself but his own family and perhaps others. For instance, a man of my acquaintance named Arap Kete had to feed his wife, his child, his sister, and his mother, as well as himself. Arap Ruto, one of his neighbours, who also worked on a farm, had at times to feed his brother Arap Minin, his wife, his four children, and his mother. Two pounds of meal a day do not go far to eke out a small crop and the produce of the traps and honey-barrels when divided among eight people in a bad season. Shortages are remedied as far as possible by the principle of naring, and a man who has food left over after feeding his own family must, and does, help to feed certain others if need be. Arap Ruto, as we have just seen, has had to feed seven people besides himself at times; but in the past the normal rule of food distribution was that a man provided meat for his wife and children, for his parents, and sometimes his wife's parents, since the old people, as always, depend on what their sons and sons-in-law can give them. A successful hunter also shared his kill with those who went with him and were unlucky. The distribution of meat was thus as follows:

262 224 177 262 [464] [466] [693] 476 224 476 [888]

Hunter
1. Own family.
2. Own parents.
3. Wife's parents.
4. Fellow hunters.

6:Huntingford E-5 (1938-1939) 1953 FL6 Dorobo FL6

313 *Rerendet* (euphorbia candelabrum) : honey-barrels.
824 *Mocet:* honey-barrels.
Ollamiyoit or *Yemdit* (olive, olea chrysophylla) : fire-wood.
Enyasiek: fire-wood.
Cornet (ficus sp.) : fire-sticks.
Teet (cedar, juniperus procera) : fire-sticks.

824 (B) Plant material. The following trees and plants provide material for food, salt, medicines, and utensils[6] :

[372] *Sasiat* (dry grass) : tinder for making fire with fire-sticks.
[285] † *Tapanariet:* fibre for baskets.
Sosiot (phoenix reclinata palm) : fibre for baskets.
[276] † *Tiinet:* medicine.
† *Opeito:* medicine.
Rerendet: medicine.
Lepuyuwet: medicine.
Sitotuet: medicine.
Seketet: medicine.
Usuet (ardisia sp.) : medicine.
[263] *Tepenguet* (aemilia integrifolia) : salt.
Serenguet: salt.
● [273] *Rotinuet* or *Rotiot* (kigelia aethiopica) : making honey-wine.

825 (C) Skins and animal products. These include :

237 † Monkey : food ; clothing.
[291] † Antelope : food ; clothing ; bags ; quivers.
[411] Pig-gut : bow-strings.
Feathers : arrows.
† Honey : food ; wine ; ritual purposes.
Ram's fat : ritual purposes.
[583] Goats : bride-payment ; ritual purposes.
Cattle : bride-payment ; milk ; dung ; hides.
[412] Bush-buck : tails for brooms.

285 The basket most commonly made by the Dorobo is the small *herepet*, about 6 inches deep and 6 ½ inches wide at the top. This kind of basket is used a good deal by the Dorobo themselves, and is also a frequent article [439] of sale or exchange to the Nandi : *kinapci herepoinik Nandi*, "we make baskets [461] for the Nandi", as an old woman said. Dorobo women make baskets when they have nothing particular to do, just as European women knit. The materials used are fibre from the midrib of the *sosiot* palm, which is split into thin strips, and bast from a plant called *tapanariet* which is used for sewing the coils of fibre with the aid of a small needle (Fig. 1).[1] The basket maker starts by splitting the *sosiot* fibre, preparing a certain length and biting it off as she

[439] [6] Things marked with a dagger † are used in the preparation of objects given to the Nandi in exchange for their products.

[1 i.e. see category 116 & 617 - ANALYST.]

6:Huntingford E-5 (1938-1939) 1953 FL6 Dorobo FL6

father (if he lives nearby), to his brothers, and lastly, if there is any over, to his clansmen in the settlement; so that a man who gets a pound or so of Nandi tobacco does not keep much of it for himself.

Drink, mainly in the form of honey-wine, is prepared not so much for private consumption as for social gatherings. It is used in various magico-religious performances, and as part of the bride-payment. When a man is visited by a friend or two, he gives them honey-wine; when there is a clan council, honey-wine is drunk; and when men and women meet for a wedding or a naming they drink honey-wine. It is thus an indispensable part of Dorobo social life. When a man wants to relax, he lies down and goes to sleep; but his amusement is composed of social gatherings. Visiting, ceremonials, and clan councils in fact provide him with his entertainment, and conversation and gossip seem to take the place of games and dances. I saw no sign whatever of the game called *kecuiek* by the Nandi, which is played with seeds or pebbles in holes in the ground or in a board, and never heard it mentioned. I neither saw nor heard of a dance, and I never once heard a Dorobo of either sex singing.

The principal standard of wealth is really a man's skill as trapper, hunter, and bee-keeper. But the products of this skill are perishable, and formerly the only way in which tangible wealth could be accumulated was in the form of weapons, honey-barrels, and dogs. Now that the old hunting conditions have gone, it is becoming possible for a man to accumulate wealth to a very limited extent in cattle or goats, which he can get by purchase, gift-exchange, or through bride-payment. The use of money has just become familiar, and a certain number of Dorobo earn wages; but except for one or two who have joined the Police, wages are not high, and the average in 1939 was 7 to 10 shillings a month. So far the Dorobo have had little inducement to work for wages, except that by signing on as squatters for a small wage they can acquire a temporary right to live on what was their own land. Beyond the fact that money enables them to buy a little extra food, our idea of wealth means little or nothing to them, and they have not yet advanced far enough into the transitional stage for it to be anything more than a small supplement to their traditional way of living. It is all that they can do to maintain themselves, let alone accumulate reserves or surplus wealth.

The transitional stage which the Dorobo had reached by 1939 is that from hunting to agriculture, with at the same time a strong desire to acquire cattle. It is sometimes suggested that hunting peoples like the Dorobo are really agriculturalists or pastoralists who have had to give up their agricultural or pastoral way of life and take to hunting. This may be true of some, such as the 'false Dorobo' in parts of Kenya who are merely outlaws and fugitives from various tribes. But it is quite clearly not true of the real Dorobo [1], like those who form the subject of this paper, who are unmistakably non-pastoral and non-agricultural. Their basic hunting tendency is shown by their character and behaviour, by their hunting techniques and skill, by

[1] Cf. my remarks in JRAI 59. 1929. p. 278.

6:Huntingford E-5 (1938-1939) 1953 FL6 Dorobo FL6

is to get as much as possible of the crop out of the way so that ploughing can start at once without having to wait till the crop is ripe. But the Dorobo had, all the same, made a step forward, for a solid, compact stook is less likely to be devastated by animals than plants standing scattered over a field.

By 25 November, 1938 the Kipukua people had reaped their crops. The shamba here was about an acre in extent, and was divided into four approximately equal-sized plots. There was little maize, for some had been eaten on the field and some had been destroyed by vermin; what was left had been stooked, and anything like an accurate estimate was impossible, though there might have been two or perhaps three bags in the stooks. If we estimate that the equivalent of two bags might have been eaten, and two more destroyed by vermin, we have about 6 or 7 bags, a somewhat high estimate for a crop grown mixed with eleusine, but not impossible[39]. Of eleusine, one plot yielded 3 bags, and another 2 bags (that is 5 bags from half an acre), not a great deal, certainly, but a fair yield under such conditions, and most useful as food, for the Dorobo eat most of their eleusine, and turn very little of it into beer. Maize and eleusine are ground by crushing on slabs of granite (*liteito*), and the resulting meal is made into gruel (*musarek*) for the children, and stiff porridge (*himiet*) for the older people; it is generally eaten with a mess of vegetable food (*inguek*) prepared separately.

Storage of crops is not yet a very difficult problem. A few of the Dorobo, it is true, have built granaries of Nandi type, hidden just inside the forest to prevent thefts by the Nandi, for anyone can lift up the roof of such a granary in the night. But since so much of the maize is eaten on the field, what is left at harvest time can be stored in the loft; and the same applies to eleusine, for it does not yield a large amount of grain. I saw no millet growing, and the Dorobo said they bought it from the Nandi.

As we have already noted, agricultural labour is divided to a certain extent between the sexes, but the distinction is not very sharp, and it was found to work out in the following way:

Men:	Both:	Women:
Heavy preliminary work	Digging	
Planting	Weeding	Collecting and burning weeds
	Reaping	

The heavy work includes lopping off branches in the Nandi manner, clearing bushes, and breaking up the ground when hard. Women may also plant, but the tendency seems to be for men to do it, though there is no absolute rule against women planting. Children help with the weeding, and herd the goats when there are any; old men herd cattle, and women also sometimes herd goats.

The Dorobo had not by 1939 acquired the Nandi belief that each eleusine crop requires new land, which in the circumstances is just as well; but they do not hesitate to give up using land which is unproductive. Thus,

[39] The bag is the standard 2 ½ lb. gunny bag used in East Africa, holding 200 lbs. of maize.

7:Wayland N-5 (ca. 1926) 1931 FL6 Dorobo FL6

241 A form of
[273] beer called *mes* is brewed from *ripp*. Planting is done in a season called *Lembweng*, when there
[132] are, or should be, light rains. This is well recognised, as are two other seasons or months: *Lowere*, a time of rain; and *Loichatto*, a time of much rain.

805 *The Calendar.*—The Wanderobo are very hazy about the calendar, and disagree among themselves about it. The "year" appears to be divided into six months, of which the following lists were compiled from those who pretend to know about them. No two agree, it will be noticed, except 3 and 4, which are probably wrong, for my informants displayed much uncertainty.

1.	2.	3.	4.	5.
Lobongo.	*Lembweng.*	*Lobongo.*	*Lobongo.*	*Lembweng.*
Lemuka.	*Lobongo.*	*Lembweng.*	*Lembweng.*	*Lowere.*
Lobwe.	*Lemuuk.*	*Lemuuk.*	*Lemuuk.*	*Loichatto.*
Lowere.	*Loichatto.*	*Loichatto.*	*Loichatto.*	*Lembongo.*
,,	*Lowere.*	*Lowere.*	*Lowere.*	,,
,,	,,			

262 *Food.*—In addition to the above-mentioned grain the Wanderobo will eat almost anything they can get their teeth into, but I do not gather that they will eat human flesh. They will devour any kind of antelope or pig, elephant, rhinoceros, etc., also carnivores of all kinds, except the hyæna; nor do they eat chicken (the Doketho say that this is because they—the Wanderobo—do not possess any) or snakes. Honey is greatly prized, and bee-traps are set
[222] for and wide in the trees.

462 *Division of Labour.*—A man's work, except during the hunting season, is wood cutting and attendance on the crops, where his main function is that of a scarecrow. During the hunting season all the able-bodied men leave the village in search of game, which they spear and trap. On wet ground they will actually run down a buck. When the hunters are out, work in the fields and village is done by women, children, and old men. The boys help with the crops, and the girls are employed in the village grinding grain and fetching water with the women. The very old people sit about and take little active part in the life of the community.

517 *Recreations.*—The Wanderobo have no musical instruments. They rarely dance, and while the children doubtless play games I gathered no reliable information under this head.

439 *Manufactures.*—The Wanderobo are peculiarly wanting in this respect. They make neither
[289] baskets nor pottery. The former I did not see among them (the people were found to be using
[323] gourds as cooking pots). The latter is obtained from the Doketho in exchange for tobacco.
[419] Their shields (*kwan*) are similarly obtained, while their spears (*kiu*) come from the Dodinga
[411] country, just over the border in the Sudan. It is noticeable that they use the short stabbing
[352] spear. These, it may be noted, are the only barbed spears I saw in Karamoja. They use headrests (*ambidwap*) of Doketho origin; as with all other tribes in this part of the world,
[531] they carry their water in gourds, upon which they frequently carve crude designs.

261
[548]

or working for it; (3) by prostitution.

Eleusine is made into beer as well as eaten; 273
honey provides both food and intoxicant (*kipketi-nik*), and salt is made by burning the caves of 262
teperguet (*aerulia integrifolia*). 263

Fig. 1 shows a clan-settlement, and the division 361
of the *imbaret* among the four households which 614
form it.

The relationship between the various members of this settlement is shown in the table on page 195.

A^1, A^2 [see category 116, pp. 194 (c), 195 -- Analyst]

[P. 196, A]

Economic life to-day is centred more and more on the *inbaret* than on hunting. 241 423

The family group is interdependent: the men trap, make tools, protect the family; the women look after house and children, and prepare food; the children, while dependent on their parents for existence, help them with the *inbaret* and live-stock, and in various other small ways. 592

There is little specialization, since all men can make traps and honey-barrels, and all women can make baskets. Joint-production occurs in (1) house-building, when the whole family takes part; (2) cultivation; (3) in hunting and in digging coloured earth. Food produced by the family is shared by husband, wife, and children, and also by the husband's and the wife's parents. Meat caught by trapping is divided between the trapper's family and the other people living in the settlement. Vegetable foods are not shared thus, since they can be got by all. Hospitality is given to visiting relatives, classmen, age-mates (though they do not sleep with their host's wife), and even to stray travellers, once their good faith is established. Beer is drunk at social gatherings of men or women, at clan councils, and on ceremonial occasions. And just as meat is distributed in a particular way (p. 193), so with tobacco: a man who acquires some gives it first to his father, then to his wife's father, and lastly to his brothers and classmen, if it will go so far. [962] [342] [241] [224] 592 421 [224] [344] 574 273 276 [331]

The typical Dorobo hut, *kuskegut*, is extremely simple, being no more than a framework of sticks covered with leaves, and a hide on top. They are now building larger and better huts of Nandi type, sometimes with unplastered walls; and an intermediate form may be seen, with a nearly flat roof. 312 [771]

D. THE MAGICO-RELIGIOUS ASPECT OF ECONOMIC

That the Dorobo had hunting magic is certain: old men say that some had it, while others had none; my friend Arap Misiiy, for example, says he was one of those who had none. Since hunting is the one phase of Dorobo life that appears to be gone for ever as a result of government action (in spite of sporadic individual activities), this [224] [771] [845]

14 Huntingford E-S (1930-1939) 1942
FL6 Dorobo FL6

[P.196, B]

important aspect is, I fear, irrecoverable. I have been in the forest in both wet and dry seasons, and while trapping is still carried on, I could see no sign of hunting (i.e. shooting), and the description of a hunt is from narration.[1] Fear of a government which forbids hunting, and has of late itself hunted the Dorobo, has, I think, effectually sealed the lips of one or two who would normally have spoken on the subject. My informants, however, did say that sexual intercourse was forbidden before setting out on a hunt, though not before or during the process of trapping. In hunting there is an element of personal danger and of uncertainty as to success; magic helps to give confidence, and abstinence to avert ill-luck. In trapping the process is mechanical, largely a matter of technological skill, and with little danger to the trapper, who is sure to catch something sooner or later.

224
[124]
[648]
[834]

On the other hand, it is believed that both *Asis* (god) and the *chesumiki* (both the good ancestral and the bad elemental) can influence a man's hunting, and before starting out to set a trap, he will say:

[776]
[782]

Asis, ĝoĝyuk paspuk.
God, give-us-enough meat,

or,

Chesumiki, okkuch tiony su kipun.
The-spirits, give-us a-beast which we-may-kill.

Honey (*kumiat*) is an important article of Dorobo diet, and provides both food and investment: it is to them what milk is to a pastoral people. It is not stuff that can be picked up anywhere, but requires a certain technique, and, above all, the presence of bees in a suitable place. As, therefore, it has an actual social value, so it has acquired a ritual value, and certain observances are necessary if the supply of honey is not to fail. First, you must have your bees, and a man who has put up a new honey-barrel must take steps to ensure that it is inhabited. This he does by calling out, in an unnatural high-pitched voice, "Bees, bees, all you who are in this country, [illegible]"

262 If lean times then come, one tries, as well as one can, to appease
the stomach with wild roots or tubers, with berries or other small
[852] fruits, with honey and honey beer. Meat is seldom eaten raw,
usually boiled or roasted at the open fire. For storage it is cut into
251 long strips that are hung to dry in the sun. When the meat is well
239 dried, it is moved away in the above-mentioned ruse, close to the
251 camp; cattle and small livestock, which are bought from the Wawi
for ivory, are not kept, but slaughtered immediately. Insofar as the
262 Wandorobbo, in barter with neighboring tribes, are able to come into
[859] the possession of vegetables, they also live on them, but actually
only during times when, for some reason, only little game is to be
had. Otherwise the vegetable food acquired by trade constitutes
only a side dish, especially for women and children. Many of them
[872] devour milk and base this on the fact that their stomachs, accustomed
only to meat diet from early childhood, do not tolerate it. Some
go so far as to throw away the udder of a slaughtered cow, although
[171] they eat that of a slain piece of game. There indeed seems to be no
doubt but that the previously mentioned Wawi belief, according to
which milk and meat must not be brought together, rests on these
273 customs. Besides water, honey beer, which they make in the same
[870] way as the Wawi, also serves them as a beverage. The latter prize
[871] that made by them more than their own, which probably rests on the
fact that the Wandorobbo keep the good honey for themselves and sell
264 only the inferior kind. Men, women, and children eat together.
[852] Both the foods for the men, his wives, and children and, on the other
[815] hand, those for the youth and his favorite girl are cooked in one pot.
From this the food is poured into small wooden bowls (kinikeg), of
283 which each adult drinking in the meal has his own. From the last
191 laws of the Wawi, the custom that young uncircised men may not
drink honey beer is still found here as a survival. Tobacco is a
276 luxury of the married. Men smoke it, coarsely cut, in pipes carved
by themselves. Ground to powder and mixed with a little soapy
ash and /333/ fat, it serves both men and women for snuffing.
Women also like to chew the snuff.

/Bill cont./

with fat several times. It is heat over the fire. The ends is plaited together, coming out invisible, out of dust animal wastes and is extended by further interweaving up to the required length. The projecting starting-ends of the individual pieces of wastes are neatly cut off, whereupon one then robs the new finished bowstring with more fat.

The arrow shaft (Fig. 94) is carved out of a dry wooden stick, first rounded, then smoothed by scraping. The upper end is vested with feathers that have been coated with the remarkable juice of a not yet described species of plaintive known as dirdi, whereupon, as rep, one drills in the end- /Bill/ /Figs. 93 and 94 appear here/ cone-shaped hole for the ring of the arrow by a rotating motion with a thin wooden chisel. At the lower end the three-part feathering -- out of the feathers of the carrion vulture (Neophron percnopterus) -- is first fastened on by being wrapped with a very fine hair thread and then glued fast with the glutinous juice just mentioned. Another wrapping of animal wastes is found between the feathering and the cue notch for the bowstring, in order to prevent a splitting of the shaft.

The people buy the iron points only if a piece breaks off /Bill/ as they as a rule forge a new one for themselves. Clubs are carved from a piece of wood, as among the Ainus. They buy the spears, of which there are one or more in almost every camp, from the Kerintshis of the island. The spears serve as weapons only in the camp, where shooting with arrows is not permitted, on account of the danger connected with that, since they are always poisoned. The bag for the rear part boy wooden bowls and gourd bottles from veterinary rubber. On the other hand, in more places they plait shallow baskets, which they use for storing food.

The fact that the Wandschina ag ost play the board game so popular among the Ainus was explained to me by Bill with the words "During the game we would forget to hunt and then, with our families, would have to starve."

With the coming of darkness complete silence as a rule rules over the camps, quiet even during the day; the day's work is done and everyone goes to his hut. Only on special evenings do the old people often sit in the open for a few hours, talking, with a good bottle of honey beer, while the young men and girls have met on their talents sing ring out through the still night, from

/Ki' ewet./
which now and then, as though on an uneven, the cry of a predatory animal responds over to them. The dance differs from that of the Masai through the fact that the men do not lift their feet, but only raise their heels. The narrow, veiled place of the camp permits only dancing on the spot. Just as there, here too it is accompanied each time by song.

In a falsetto (3)

[36] 1. Recorded by Hans Waldmann /half physician/ Dr. Rhenish.

the tone, just barely reachable, roughly the A above middle C (seventeen strokes), is strongly accented and shrilly sung out. In an extremely irregular beat the succession of tones now descends to the six-four /[illegible]/ chord of A. At the A below middle C the chest tone sets in, but relatively softer than the falsetto, until, descending to the same degree of the scale, the second A below middle C is reached. The final tones are more certain, because they lie better for the singer; the falsetto usually hovers around the tone sought, is just uncertainly, is just playfully.

Arpeggiations, triplets are repeated all the more frequently the more certain the entire gradually feels in adhering to the melody -- ak rooto nakt /so to speak/. No other figure are observed. Finally the voice once more glides within the seventh chord up and down the last octaves; on the fundamental tone is pleased in contrapuntal fashion at the end. The entire song is an irregular variation of a six-four /[illegible]/ chord. It is limited almost entirely to two octaves. Through the greater probability of being hit properly the fundamental tones of the chord form the natural rest points for the voice and may sometimes be interpreted as wrong parts of the measure. In marching they coincide with the putting down of one foot. Nevertheless there is not any sort of time that can be observed. The delivery is often pathetic, and the tempo also corresponds to this style. The fact that the /Ki'/ text is arranged at thirteen /ar vili/ for each one heightens the tension, if not the musical enjoyment, of the listener.

IV.

000 Marital relations. -- Polygyny. -- Betrothal. -- State of being betrothed. -- Conversion of the young men to the state of the married. -- Bride price. -- Forcing the consent of the father of the bride. -- Exchange of wives. -- Obstacles to marriage. -- Entering into marriage. -- Dissolution of the marriage.

595 The marital relations also offer little that is new. Polygyny exists only to a limited extent; most of the people are too poor to acquire and support more than one wife; only a few have two wives, 584 and if a man has three of them it is a rarity. Betrothal in earliest 191 childhood seems to be more frequent here than among the Masai, but no more binding and without legal consequences. As a rule after circumcision the youth is betrothed to a girl eight to ten years old, after his father has proposed for him to her parents. As among the Masai, the /Kik/ betrothed persons live apart and may not even see each other. The bridegroom lives with a girl in the one camp, and [836] in the other, the bride with another youth. If the bride becomes [848] pregnant before the wedding, dissolution of the betrothal does not [684] always take place, as among the Masai, but rather the one who made her pregnant must reimburse the bridegroom by the payment of a head of cattle.

561 Here, just as among the Masai, the young men of an age class 582 together decide upon their entering the wedding of the married, and 574 their fellow companions confirm this intention by a feast corresponding to the ol gatad i ol ik, to which friends and neighbors participate. [273] They are served game and honey beer, the latter of which, however, [224] the marriage candidates may not yet drink. They like to set the feast for the day after a successful elephant hunt, so that the guests can feast heartily on meat.

583 Before marriage can be entered into, the bride price is to be [439] paid. The bridegroom usually gives the father of the bride, even before her circumcision, five pots of honey and five beehives, and, [illegible] the rank that belongs to its furthermore, two head of cattle, which

[illegible]

From time to time the people celebrate a supplication feast for [illegible], which they call keeping or keeping. For a keeping a feast, a feast to ask God for children, the married women station themselves in a circle around a small fire (see which), just as for every other supplication feast, they wave the censer of the honey bee, rendering clouds of wax particles, so that its fragrance will rise up to God. While an aged, respected man goes around the circle and sprinkles these persons with honey bee, they sing [illegible]. After this has gone on for a quarter of an hour, they rest to dance, continuing to sing the same words. The dance is followed by a meal at which meat and honey bee are consumed. At a keeping a egg they ask God for meat. Beside a small fire they place upright a straight branch with several forks at the top, the twigs of which are cut off short. The empty stick is supposed to show God that they do not have any meat. All the companions station themselves around the fire and sing [illegible] (meat = game). The men wearing the bearskin act out, and as soon as they bring home meat, a small piece is placed on each twig of the forks of the branch. Again all surround the newly kindled fire and now sing [illegible] which is to say: God, give us still more food. The men celebrate another supplication feast before a larger hunting expedition. In the middle of the camp a small fire is made, around which the men stand in a circle. Each one has the bow in the left hand, a twig of the elk deer (Alces palmatus) in the right one. Then, going around to the left, they walk around the fire four times, during which they sing [illegible]. They maintain that they have never yet prayed in this way in vain, for then after a keeping a egg they always returned from hunting with rich booty. The [illegible] do not have a feast corresponding to the of eggs | of guests. Rather, without special ceremonies, they cut off a strip out of the hide of an animal just shot and wear it as an amulet around the right middle finger. As soon as they meet something along the way that makes them afraid, be it a predatory animal or an enemy, they blow on the hide strip, which is the equivalent of a prayer for protection. Other amulets are very commonly used. The caftan are only one, which they called raven and which consisted of a small piece of [illegible]. It was worn on the neck ring and was supposed to pro-

[illegible] supplications Feast conducted by the Bears to preserve the health of human beings and [illegible]-dead part.]

The women
prepare food and rock upon the men, themselves eating when the men have finished.
At the present day the Dorothe are taking to eating chocolate grain, which is crushed
on grindstones (*Mahle*, *N.*) and made into a sort of porridge; coral nuts, which they
obtain from Ruanda, if there are any men there. Beer is made from honey, and
is called *Ngbalabali* (*N.*). Tobacco (*mwanza*, *N.*; or *ekpakolokolo*? *N.*) is bought
from the Ruanda, and is taken by men, and occasionally by women. It is either
chewed (*wiri*, *N.*) or smoked in Ruanda pipes (*mbuli ngo-mwanza*, or *kwabuli*, *N.*),
which are also obtained from the Ruanda. The men rarely tobacco in *ngbalabali*
horns called *Ngwanzi* (*N. Ngwanzi*) (Text-fig. 88), made from *mwanza* (*kwabuli*),
with skin coverings for the ends, to which are attached thin leather thongs, by
which the horn is slung round the neck.[1]

Agriculture and Stock.

Formerly the Dorothe possessed no stock, nor did they till the ground. During
the last quarter of a century or so a few of them living on the edge of the forest have
taken to cultivating small plantations (*Lukwa*, *N.*), in which they grow chocolate
grain (*Mbwanti*, or *pwati*; *N. pati*) only. A few possess, at the present day, one or
two cows; others have a few goats and sheep; no one has more than 8 to 10 head.
The only animals they possess in numbers are dogs.

Dress and Ornaments.

(i) *Males.*—Boys wear skins of antelopes and monkeys (*ekwisi*; *N. kpwisi*).
Warriors wear skin garments of clothes (*ngbisanga*? *N.*) called *ekwisi*; they wear
leg-bells attached to a leather band (*ngalibbo*? *pl. ngalibbolabali*) on the ankles.
Dorothe-boys wear pieces of cotton-cloth (*ngai*, *N.*) tied loosely? Old men
wear loin-cloth skins (*ekwisi*) with the fur left on. Caps (*ngwanzi*) are worn, of
blue duiker skin with the fur left on, by old men, and of cotton-cloth by warriors.
Belts (*mbwanzi*) of leather are worn by old men, and of beads by boys and warriors.
Necklaces of shells (*ngwalalla*, *N.*) or bone-wire (*ngbagali*, *N.*) are worn; also various
kinds of iron ear-rings (*ekkwanzi*) and bracelets (Text-figs. 15–17); *N. kwan-*
wisi) are worn by warriors and chiefs.

(ii) *Females.*—The dress of the women and girls is very similar to that of
Ruanda women. They wear skirts (*ekpakpigani*; *N. ekpakwi*) and upper garments
(*kabbo*, *N.*), both of waxed leather, with the fur removed, in the same manner as the
Ruanda women. Their ornaments consist of iron wire armlets and leglets (*ngbisanabali*
and *kwali*, *N.*), and wire necklaces (*ngbagali*, *pl. ngbagalibali*, *N.*). Married women wear

[1] *Ngbalabali* means "snuff" in Ruanda.

[2] There are leather in the Ruanda Congo Colony, from which indeed they are probably
borrowed.

[3] As in the Ruanda, from whom doubtless the custom spread to the Dorothe.

4:Huntingford E-1 (1938-1939) 1953 FLA Dorobo FLA

eastern part of the area and towards Londiani. Monkeys and pigs are found both in and outside the forest; leopards live on the edge, and lions are still occasionally met with in the open country near the forest. Antelopes are still found, but they are not so plentiful as they used to be.

Honey is produced in honey-hives. This constitutes a special department of Dorobo life, and will be described in § 3 below.

Wild vegetable foods which grow in and round the forest are eaten both cooked and raw as relishes or additions to the staple diet of meat and cereals; the task of collecting vegetable food is usually performed by the women. Recorded wild foods eaten are:

Fruit of the *sirinik*, which are something like white currants, dried in the sun and eaten raw.
Fruit of the plant *mmomyat*, *rubus rigidus*.
Fruit of the *kwariyaat*, *clausena anisata*.
Fruit of the *sasonisi*, *Musa ensete*, the wild banana.
Leaves of the *siwet*, *gnetum conchinatii*, *netik*.
Pulp of the wild banana, eaten in place of what the Nandi call *kimeiet* or 'porridge'.

Banana sap is collected by sticking a flat piece of wood into an incision made in the stem of the tree; a receptacle is hung on the end of the wood and left there for the sap to drip into it. The fruit of the wild banana (a very poor substitute for the cultivated kind) is placed on the drying tray (*saiset*) over the fire till it is roasted by the heat, and is then broken up with two stones and chewed; it is very hard. Tobacco is bought from the Nandi.

Before fruits and wax obtainable through the Nandi, the Dorobo made a substitute from the leaves of the sabagaat bush (*acanthus longifolius*), or of the serogiet tree. Leaves were burned, and the ashes collected in a receptacle resembling, a little water was poured on them and mixed, and the resulting liquid was added to food as needed. Some of the Nandi Kaviloandi used to make a similar substitute for salt.

Intoxicating drink is chiefly made of honey, though now a little simple beer is made in the Nandi manner. The Dorobo method of making *kipkeiwet* or *kwonyo apt* is, "honey-wine"; is as follows. As a fermenting agent, the wood-pods of the *mitemet* tree (*Angelia acrinagina* or the *mmagat* tree, which may be as much as a foot long and four inches thick, are boiled till quite soft when they are cut into strips and put into the honey to make it ferment. A Dorobo description of the process of making the drink is this:

[illegible]

[illegible]

285

unite it, i.e. as the loose end gets thin, a new end is shoved under the binding; the heat is kept handy in a bundle. The technique is a spiral coniction with a flat, then gradually ascending coil, of the simple over-sewn ype, and low-step variety, the stitches being spaced out and not close ogether. The base of the basket is formed of six fibre coils, sewn together vith heat. A hole is made with the needle, and the heat is pushed through it. t frequent intervals the fibre and the heat are moistened with the lips. After the first six coils, a slight rise is made; as each coil makes a complete ycle it is slightly raised in order to make the bend between the base and the ides. When a new piece of heat is needed it is shoved right through the hole, eaving about ½ to 1 inch on the other side, and is sewn through as before. he basket maker works with lengths of heat of 6 to 12 inches. The fibre coil s of about the thickness of a pencil, and this must be maintained. When the ength of fibre is reduced to about 2 ft. it begins to get thin, and some new ips must be added by chewing off a further length. The structure of the asket is thus, in effect, a continuous coil of compressed fibre, each line of oil tied to the next by stitches of heat. Sometimes the base is made of a maller piece of leather, to which the first coil is sewn, the rest of the rocedure being the same as for the all-fibre basket.

281

The dressing of skins, including those used for exchange, is a simple rocess, for no chemical agent is applied. The newly flayed skin is tightly egged out on the ground while it is still wet and left to dry in the sun. When ry, it becomes stiff, and in this state it is rubbed with an axe-blade held t an angle of about 20°, the blade being rubbed backwards and forwards till e skin is soft and supple. If it is to be used for a woman's garment or other ject in which fur is not needed, both sides are rubbed. Skins are dressed by [462]
omen. Apart from clothing, the chief objects made of skin are bags, quivers, [465]
d parts of tobacco-boxes. The material used for sewing is generally pig-gut. [285]
e needle of course has no eye, and the method of sewing is therefore to [462]
ake a hole with the needle and then push the gut through it. Bags, especially [465]
e used for many purposes, including the carrying of honey and coloured
ith. They are generally made of antelope skin (e.g. blue duiker), and unless [925]
oloured for luxury the fur is left on the outside. They are provided with a
p, a strap for fastening and a sling for carrying them from the shoulder.
ommon size is 7 ins. by 6 ½ ins., but I have seen them as big as 18 ins. [274] ●
9½ ins. Tobacco-boxes are made from internodes of bamboo, but they have
ther covers at each end, and a thin leather strap is sewn to the covers so
at the owner can sling the box round his neck.

434

The natives of Dorobo life demands exchange of products with the
Gall. The most important of the products they get by exchange is ironwork;
ner things are pottery, beads, tobacco, cereal seeds, and cattle, and a fairly
antity, though possibly fluctuating, scale of exchange values has come into
istence. In 1939 some of these values were: 436

† considered for a good bill of honey.
0 known for 1 day's weeding in the blacksmith's shamba.

6:Huntingford E-5 (1938-1939) 1953 FLA Dorobo FLA

436 1 bundle of tobacco (about 1 lb.) for 1 bagisi of honey.
1 large earthenware pot for 1 large prepared antelope skin.
1 small earthenware pot for 1 small prepared antelope skin.
2 baskets of cereal meal for 1 basket (*korpet*).
1/- worth of trade beads for 1 gourd full of honey.

[E4] The bag used as a measure for honey is the smaller size of *korpet*, measuring 7 or 8 ins. by 6 ½ or 7 ins. The gourd is about 10 ins. long. The large pot stands about 20 ins. high, the small, about 10 ins., and the large antelope skin is usually a bushbuck, the small one a duiker.

437 There are no special market places or places of exchange. The Dorobo
438 go to the nearest smith or potter and make a bargain, returning later with
[443] the exchange equivalent to collect the goods. There is no language difficulty
[197] in these transactions, for the Dorobo language is no more than an easily understood dialect of Nandi. Getting iron or pottery means going into the Reserve, but to get seeds, tobacco or beads they need only go to the nearest friendly Nandi who has what they want and is willing to make the exchange. Sometimes plant material of medicinal value (i. e. what they think is medicinal value) is substituted for some of the regular exchange articles, but the above list represents the ordinary practice. When Dorobo have money with which to buy what they want instead of exchanging goods, they have the choice of going to the shops at either Songhor in the south, or else at Aruwa in the Nandi Reserve, where there is a collection of Indian shops. The men do not
[E62] like their womenfolk to go to these places unescorted, but occasionally some of the bolder ones try to slip away undetected to Aruwa; they seldom go to Songhor, as it is in the European area.

476 No human group can exist without some form of co-operation, and even when a man lives alone, as he may have to among the Dorobo, he is not because of that cut off from or unable to share in the activities of his kind. Within the family people are interdependent, and in the settlement they help each other. The main activities in which people normally co-operate are four in number: 1. House-building; 2. Hunting; 3. Digging earth; 4. Cultivation.
[462] (1) Building huts is women's work, which a man will do if he has no wife, and
[234] for which he will get help from a relative or classificatory. (2) When people
[M7] hunted game they usually went out in parties, and the kill was shared among them. (3) Digging earth means a journey of anything up to 10 miles round the edge of the forest and into country where nowadays there are strangers, so people find it both safer and more convenient to go in parties, for though they are in no danger of being attacked, their unconquerable shyness demands numbers to give confidence. (4) In a family or clan group, though each individual has his own
[344]

Together with the spirit of co-operation in the rule of joint consumption.
[378] We have already seen how meat is shared according to definite rules; and among the Dorobo certain other things which are hard to come by must also be shared. The chief of these is tobacco, of which when a man has acquired even a small supply, he is supposed to give some to his father, to his wife's

6:Huntingford E-5 (1938-1939) 1953 FL6 Dorobo FL6

father (if he lives nearby), to his brothers, and lastly, if there is any over, to his classmates in the settlement; so that a man who gets a pound or so of Nandi tobacco does not keep much of it for himself.

Drink, mainly in the form of honey-wine, is prepared not so much for private consumption as for social gatherings. It is used in various magico-religious performances, and as part of the bride-payment. When a man is visited by a friend or two, he gives them honey-wine; when there is a clan council, honey-wine is drunk; and when men and women meet for a wedding or a naming they drink honey-wine. It is thus an indispensable part of Dorobo social life. When a man wants to relax, he lies down and goes to sleep; but his amusement is composed of social gatherings. Visiting, ceremonials, and clan councils in fact provide him with his entertainment, and conversation and gossip seem to take the place of games and dances. I saw no sign whatever of the game called *kewiok* by the Nandi, which is played with seeds or pebbles in holes in the ground or in a board, and never heard it mentioned. I neither saw nor heard of a dance, and I never once heard a Dorobo of either sex singing.

The principal standard of wealth is really a man's skill as trapper, hunter, and bee-keeper. But the products of this skill are perishable, and formerly the only way in which tangible wealth could be accumulated was in the form of weapons, honey-barrels, and dogs. Now that the old hunting conditions have gone, it is becoming possible for a man to accumulate wealth to a very limited extent in cattle or goats, which he can get by purchase, gift-exchange, or through bride-payment. The use of money has just become familiar, and a certain number of Dorobo earn wages; but except for one or two who have joined the Police, wages are not high, and the average in 1939 was 7 to 10 shillings a month. So far the Dorobo have had little inducement to work for wages, except that by signing on as squatters for a small wage they can acquire a temporary right to live on what was their own land. Beyond the fact that money enables them to buy a little extra food, our idea of wealth means little or nothing to them, and they have not yet advanced far enough into the transitional stage for it to be anything more than a small supplement to their traditional way of living. It is all that they can do to maintain themselves, let alone accumulate reserves or surplus wealth.

The transitional stage which the Dorobo had reached by 1939 is that from hunting to agriculture, with at the same time a strong desire to acquire cattle. It is sometimes suggested that hunting peoples like the Dorobo are really agriculturalists or pastoralists who have had to give up their agricultural or pastoral way of life and take to hunting. This may be true of some, such as the 'false Dorobo' in parts of Kenya who are merely outlaws and fugitives from various tribes. But it is quite clearly not true of the real Dorobo.* Like those who have the privilege of [illegible] non-pastoral and non-agricultural. Their basic hunting tendency is shown by their character and behaviour, by their hunting techniques and skill, by

* Cf. my remarks in [illegible] op. cit. p. 370.

[P.192, B]

and by personal ability, and therefore to some extent by their geographical setting. They have no iron ore, no metallurgic knowledge, and so all ironwork is imported from the Nandi. Tobacco, which they like, is not grown as yet, and this too must be obtained from the Nandi. There is a regular exchange of honey, skins, and baskets, for arrowheads, knives, tobacco, seeds, pottery, etc., and a scale of exchange values has come into existence:

1 arrow head is given for a gourd of honey.
1 bundle of tobacco is given for a bag of honey.
1 large pot is given for a large bushbuck skin.
1 small pot is given for a duiker skin.
2 basketfuls of seed for one basket.[1]

Sometimes personal services are given, e.g. a day's weeding in the smith's garden for two knives.

Cattle are obtained from the Nandi, to a limited extent, by a system of gift exchange for furs. The Nandi make friends with the Dorobo chiefly for the purpose of getting honey, and the Dorobo will give some to his Nandi friend without expectation of an immediate return. Presently the Nandi gives the Dorobo a goat, and this exchange of gifts paves the way for further and more important transactions: eventually the Dorobo offers his friend a fur cloak for an ox, as e.g. my friend Arap Mising acquired one from a Nandi called Kapkile at Ollessos; he also got another in exchange for 7 goats, which he bought out of his wages for working on a farm.

C. Techniques

1. Hunting

The dry weather, *ameimenik*, is the shooting season, and the wet weather, *dost*, is the time for trapping. The weapon is the bow and arrow (spears are not used by the Kapchepkendi Dorobo), and the hunters use dogs.

In wet weather buck are caught in traps. In

[1] A hunter's bag is about 12 ins. deep, and 9 ins. wide; it contains about twelve or maybe twenty as a general. A hunter's (baragoet) is about 9 ins. deep and 6½ ins. wide at the top.

[2] Namely, the wart-hog (*Phacochoerus aethiopicus*) and *Tyiret*, the grass hog or bush-pig (*Hylochoerus Meinertzhageni*).

[P. 196, A]

Economic life to-day is centred more and more on the *shamba* than on hunting.

The family group is interdependent: the men trap, make tools, protect the family; the women look after house and children, and prepare food; the children, while dependent on their parents for existence, help them with the *shamba* and livestock, and in various other small ways.

There is little specialization, since all men can make traps and honey-barrels, and all women can make baskets. Joint-production occurs in (1) house-building, when the whole family takes part; (2) cultivation; (3) in hunting and in digging coloured earth. Food produced by the family is shared by husband, wife, and children, and also by the husband's and the wife's parents. Meat caught by trapping is divided between the trapper's family and the other people living in the settlement. Vegetable foods are not shared thus, since they can be got by all. Hospitality is given to visiting relatives, clansmen, age-mates (though they do not sleep with their host's wife), and even to stray travellers, once their good faith is established. Beer is drunk at social gatherings of men or women, at clan councils, and on ceremonial occasions. And just as meat is distributed in a particular way (p. 195), so with tobacco: a man who acquires some gives it first to his father, then to his wife's father, and lastly to his brothers and clansmen, if it will go so far.

The typical Dorobo hut, *hodoggot*, is extremely simple, being no more than a framework of sticks covered with leaves, and a hide on top. They are now building longer and better huts of Nandi type, sometimes with unplastered walls; and an intermediate form may be seen, with a nearly flat roof.

D. THE MAGICO-RELIGIOUS ASPECT OF ECONOMIC

That the Dorobo had hunting magic is certain; [illegible] some; my friend Arap Mining, for example, says he was one of those who had none. Since hunting is the one phase of Dorobo life that appears to be gone for ever as a result of government action (in spite of sporadic individual activities), [illegible]

/232 cont./

262 If lean times thecome, one tries, as well as one can, to appease
the stomach with wild roots or tubers, with berries or other small
[252] fruits, with honeyand honey beer. Meat is seldom eaten raw,
usually boiled or roasted at the open fire. For storage it is cut into
251 long strips that arehung to dry in the sun. When the meat is well
239 dried, it is storeaway in the aforementioned tree, closet to the
231 camps: cattle and small livestock, which are bought from the Masai
for ivory, are notkept, but slaughtered immediately. Insofar as the
262 Wandorobo, in baer with sedentary tribes, are able to come into
[239] the possession of vgetables, they also live on these, but actually
only during times-when, for some reason, only little game is to be
had. Otherwise th vegetable food acquired by trade constitutes
only a side dish, specially for woman and children. Many of them
[272] detest milk and lue this on the fact that their stomachs, accustomed
only to meat diet from early childhood, do not tolerate it. Some
go so far as to thre away the udder of a slaughtered cow, although
[271] they eat that of slain piece of game. There indeed seems to be no
doubt but that thepreviously mentioned Masai belief, according to
which milk and eat must not be brought together, rests on these
273 customs. Besides water, honey beer, which they make in the same
[270] way as the Wamitaisu serves them as a beverage. The latter prize
[271] that made by theirmore than their own, which probably rests on the
fact that the Wandorobo keep the good honey for themselves and sell
264 only the inferior kd. Men, women, and children eat together.
[262] Both the foods for'e man, his wives, and children and, on the other
hand, those for thyouth and his favorite girl are cooked in one pot.
[265] From this the foods poured into small wooden bowls (kitchens), of
which each adult eating in the meal has his own. From the food
273 laws of the Wamaithe custom that young unmarried men may not
271 drink honey beer still found here as a survival. Tobacco is a
• 276 luxury of the rnared. Men smoke it, coarsely cut, in pipes carved
by themselves. Good to powder and mixed with a little snuff
[illegible]
Women also like to chew the snuff.

/251 cont./

224 they particularly value the entrails and also do not scorn the meat of
222 fallen or stricken animals: indeed, even the skin of elephant, rhinoc-
eros, and hippopotamus is eaten roasted. As huntable, i.e., here
[223] edible, the Wandorobo regard elephant, rhinoceros, hippopotamus,
[439] pigs, zebras, all cloven-footed animals from the giraffe to the tiny
dwarf antelope, hares, rock rabbits, and, of the birds, the ostrich,
which, however, they shoot only on account of its feathers, which the
Masai like to buy for the manufacture of the war head-ornaments.
They do not hunt monkeys and lower animals, because they do not
relish their meat.

224 On the day before the new moon, and in places also on the
seventeenth day, the ol onjogi, no one goes hunting because, according
to popular belief, one would not kill anything on the former day,
whereas on the latter the bow would break. The red-headed Anaplectes
[825] melanotis is regarded as unlucky for the hunter. If the hunter sees it
[777] along the way he returns to camp immediately and does not leave it
again until several hours later, in order to try his luck anew.

561 Like the warriors of the Masai, the dolenong of the Wandorobo also
224 hold their meat meals in the forest. Whereas among the former,
171 however, these are a result of the food rules, according to which the
[778] warrior may not eat meat in the kraal, among the latter it is only a
matter of observing an ancient custom for which there is no longer
any reason today, since the unmarried man usually eats his meat food
in the hut. On the other hand, there is greater justification for retain-
[262] ing the en dunik, where they strengthen themselves by a plentiful
[224] eating of meat for a larger hunting expedition for more distant and at
the same time dangerous game, such as elephants and buffalo. The
[263] many spices and stimulants that we became acquainted with among
[276] the Masai are also used by the Wandorobo, but to a far lesser extent.
They do not divide up into fellowships for the meals in the bush, but
561 only for the hunting expeditions. Each company, as a rule, consists
224 of four men and is called a siriq, in which one recognizes the pioneer
[379] equal parts. If an individual hunter or an e siriq spends the night in
a strange camp, the host is given a howling and a hind leg of the
hunting booty.

/254 cont./

X.

Diseases.

757 For diseases the Wandorobo use the same medicines as the Masai
1911 and also prepare them in corresponding fashion. These medicaments,
• 276 that the latter take mixed with milk or blood, the former mix only
1911 with water or game bouillon. The Wandorobo are also familiar with
the nerve-stimulating agents taken so much by the Masai warrior,
but they do not use them in such extensive measure and never in such
1911 quantities that fits of rage appear among them. Their designations
1912 for the principal diseases are the following: Headache = ngeng ngôna =
sick head; toothache = lîgî ngoma = sick teeth; cough, chest or pleural
chest pain, lîbe ngoma = sick chest; stomach-ache = vaia ngoma =
sick stomach; diarrhea, vaia kutîî, constipation, vaia gwhobogwogwe;
dysentery allegedly is not supposed to occur. Smallpox, ol maeburgo
or alîgi chickenpox, sinîmo. Gonorrhoea, dondîî lom, ne ekîtîn.
Elephantiasis, as well as f. scurv, is said not to occur. Fever,
kalongoma; bilious fever, ol odoa. Tension, pinîdîgi sarotik,
752 swelling. Injured blood vessels are ligated, bone fractures splinted.
On burns one puts the soft, pinkiline covering of the roots of the ol
(736) dungit bush. Excess fingers and toes are not amputated; they are not
(732) regarded as particularly unsightly.

755 If the well-known medicaments do not help, the patient turns to
the ol piratîni, from whose magic medicine he expects a cure. The
759 surgeon is called ark-ap among the Wandorobo, the midwife gweche
kare-kawa-kwiîn.

Lithuaingford E-4,5 (1938-1939) 1953 FLA Dorobo FLA

and lying about on the farms. The only weapon is the bow, basically similar to Dorobo types (measurements from the Kamasi bow [Dorobo op.] 5 ft. 6 in. long), and the bowstring, used, is made from gut of the giant pig, Hylochoerus. Arrow-shafts are made from the Acokanthera and sometimes from the Euphorbia candelabri; arrow-heads are bought from the Kamasi, and are of the Kamasi patterns. Arrows are carried in quivers made of hide. Arrow poison is made from the Acokanthera Schimperi.

Basketry

Making baskets, though, is a common occupation of Dorobo women. They are made from fibre of the plantain-resembling palm, *Hyphaene*, and sewn with bast made from a plant called *ngwenetet*. The technique is a spiral foundation with a flat plait gradually ascending coil, of the simple over-over type and two-step variety, the stitches being spaced out and not close together.

Miscellaneous

Salt used to be made from the ashes of the plant *Salsola Aucheriana*, but coarse white earth is found near Timboroa on the east of the Dorobo country, and men go in parties of four or five to dig it, carrying home the earth in large leather bags, mainly in order to sell it to the Kamasi who, in 1938, gave them 2s. a bag. Red earth, *mokwet*, is mixed with fat or ointment as fat rubbing on the body; white earth, *mwonet*, has magico-religious uses. For carrying a number of small objects a carrying-net called *kibwaiet* is used. It is made of a pair of oval rims 2 ft. 6 ins. long with pieces of bark stretched across them, somewhat resembling a pair of tennis-racket rackets. These are sometimes used by the Kamasi.

Beliefs and Customs

Religion

Asista, the sun, is recognized as a being that can supply or withhold the needs of people: *Asis, ipkore ipkoyoti*, "Asis, fill us with meat," is a common prayer. Some say that *Asista* the moon is his sister, others that she is his mother. Besides *Asis*, it is believed that there is a being called *Ilat*, the Dorobo, who produces rain, and "the rainbow is his arm which draws up water for him." The Dorobo also believe in spirits, good and bad, both of which are called *mwendwa*, a word which includes the ash (ancestral spirits) and *mwaamberenik* (evil spirits) of the Kamasi. The ancestral spirits have the same significance and functions as those of the Kamasi, and though they punish the living for doing evil, they are otherwise friendly and visit the living, travelling in the bodies of snakes, both in an Iten people and in one kind in the form of *kibukeiti* (honey and water); spirit-snakes should not be killed.

Divination

The Dorobo appear to have no diviners of their own, and when they have reasons to divine/ask as to cause of illness or witchcraft, they go to Kamasi diviners of the type called *oiboyanik* by whom they are charged a shilling fee. The people called *ollotyot-ap-arkaldi* among the Dorobo are no more than healers or physicians who prepare healing medicines from roots and plants. Although the Dorobo have a reputation among other tribes as powerful sun-makers, they themselves say that they have no sun-makers, which is probably true.

Death and Burial

The old, sick and weak are buried in narrow holes about 4 ft. deep in which the bodies are laid full length, varying from children who are put into a sitting position by children about a month of age, to old people who are laid down in a grave. Other people are laid out for the funeral, both sexes on the right side with

2:Maguire G-5 (ca. 1926) 1927-28
FLA ↔ robo FLA

covered with a strip of soft hide—often the of reedbuck or 411
leopard—worked to a state of pliability resembling that of chamois leather. The barb is never coated with poison under any circumstances.

A small supply of *bush poison* (*agwaro*) is sometimes carried [378] ●
in the keel of the quiver. This poison is a hot, sticky mass [439]
made by boiling the leaves of a certain tree and is manufactured exclusively by the Wakumbe. The Dorsi know nothing about it, hold it in considerable awe, and have never attempted to make poison of their own.[1]

In the quiver is also carried a fire-stick (*kiwindagwo*) and a 378
fire-block (*arumadi*). The Dorobo are expert at making fire and scorn to use matches. A small flat spoon (*kanzikiwandia*) 418
for smearing poison on the arrow-heads is carried—this spoon is made from the same wood as the bow; and a small knife for smoothing and rounding the arrow-shafts. This knife is called *awasu ziziki*.[2] A wooden tube about twelve to eighteen inches long and a quarter of an inch diameter, not unlike a pea-shooter, will always be found in Dorobo quiver. This tube, called *endulo*, is used for drinking out pools which are shallow or which have a dirty, scummy place. (It is a [391]
point of honour with every Dorobo and an injunction built law that a man should not stir up the mud in any water at which he drinks.) The *endulo* is also used to blow, by blowing 392
through it, a blaze or clouds of smoke from [coal grass put into a fire to drive the bees away from the honey.

A Dorobo quiver, as we have seen, contains a large number of 415
objects essential to the bush life that the Dorobo leads. It is scarcely to be wondered at, therefore, that it is next to impossible to purchase a furnished one. A Dorobo once told me (I am sure he meant it) that he would not exchange his quiver and its contents for five cows. The price usually paid to [383]
the parents of a girl taken in marriage is [illegible] cows, to five cows, over a subsequent six-year payment; but for a full quiver would be regarded as extortionate.

The Dorobo may be seen sometimes with a small axe which 412

[1] That is, arrow poison. The Dorobo are reputed to have a powerful poison they use over seed. When hunting, it is stated to have a local result. [391]

FLA Dorobo FLA

SOME *MINIRO* FOLK-TALES, FOLK-LORE AND SUPERSTITIONS

" Epito dimdo kitii " [1]

These answered a *Miniro* Dorobo whom I called on his silence and attitude of strained attention during a halt by the wayside when on safari in the remoter areas of the Tanganyika Mossi Reserve.

The bush and what can be wrested from it—wood for his bow and arrows, honey for his wife and children and for barter, the bark of the *Ol-mukutwa* [2] tree, fibre for plaiting into his hair, and last (but most important of all) the skins and the meat of game animals—these things bound the horizon of the Dorobo. It is therefore not to be wondered at that such folk-lore tales as exist among the Dorobo at the present time are chiefly concerned with animals and animal life. Similarly, the paramount interest in life of the Mossi is apparent from a study of the extant folk-tales of that tribe, which deal, to a great extent, with cattle and other domestic stock. The tales one hears told to-day are, in all probability, but a few of the more easily-remembered of a host of stories now forgotten for all time.

The following examples have been selected from a large number of stories told by the *Miniro* themselves and admitted by the Mossi to be Dorobo in origin.

The Ostrich and the Elephant.—The ostrich, when out walking in the bush one day, chanced to fall over a piece of elephant-dung in his path. This made him very angry and he said: " Thou art I recommended by the dung of the elephant! I am so small that I cannot hope to inconvenience him in like manner, but I will arrange for all the members of my tribe to come and make use of one place, and thus in time the heap may grow big enough to trip a passing elephant." This is the reason why piles of ostrich-dung, showing that many of these animals [illegible] path. (A story very like this is told by certain Coastal tribes.)

The Tortoise, the Hare and the Hyaena.—These three made an agreement to rob a rich snake. The latter had cattle and

[1] " I am listening to something in the bush." Cf. the Mossi *Ya-dim kitii*.

[2] *Albizzia antidysenterica*, according to the authority quoted in Dalziel. It is used as a remedy for stomach ache and to produce a huge appetite. It is highly prized by the Mossi and is scarce in the Dorobo localities.

Hunting

224 The chief occupation and, in fact, till the last few years, the only occupation of the Dwellas, is hunting (*ngan*: Kiny., *kiy-ngan-kan* = hunter). They say that at the present day they do not hunt as much as they used to. All kinds of animals were the objects of the chase; the buffalo (*kijanumb*; D. *wini*), rhinoceros (*kijibwai*), leopard (*wollibo*, D.), lion (*wombi*; *kjakinombi* D.), giant pig (*mombo*, D.) were among the bigger game hunted. Various kinds of monkeys and antelopes are also sought after, both for their skins and their meat. (See "Food" for a list of the animals eaten by the Dwellas.)

[xiii] The weapons used in the chase are the bow (*bogolighi*, D.) and arrow (*bisai*, D.; *mbwaiti*, etc.), and spears (*dikenombolo*?). Arrows and spears for hunting are poisoned with a concoction made from the bitter tree (*D.*)? Formerly, before the elephant disappeared from the Dwellas region it was hunted and killed with poisoned spears. Small game, besides being shot, are also caught in traps and snares, of which the Dwellas have two kinds; buffalo are also caught in the first kind.

[xiv] (1) The (*ngwai*), armed with thin sticks and horns, with spikes (*kijanangkinai*) on to the bottom. (2) Snares (*gumbai*; D. *nuwai*) (Text-fig. 26), which are constructed as follows: a springy stick, *b*, is stuck in the ground and bent over; to the upper end is fastened a piece of cow-rope, *R*, which is loosely attached to a hanged stick stuck in the ground, supported by three short upright sticks; a little below down the bent stick *b* is fastened a snare made from the silkworm tree, which is held in place by a thin stick stuck in the ground on each side; under the snare is made a little platform of sticks, which is covered with leaves. When this platform is touched, since it is in contact with the stick holding the rope *R*, it releases the rope, and the stick *b* flies up, thereby tightening the snare.

[xv] Dogs (*kjibbi*, pl. *kjibbi*) are used in hunting, and are the only animals kept by the Dwellas who live in the forest. When in the forest they wear leather collars, to which are attached, under the throat, a small bell. The dogs seem to be of a different breed to the ordinary kite-eared pye or common native mongrel, and they are kept in better condition. Their excrement round the huts takes the place of manure in the neighbourhood of a Fiwoli hut, and makes the air unpleasant.

A description of the weapons is given on p. 549 below.

Food

216 The staple foods of the Dwellas are honey (*bombo*, D.) and meat (*ganghi*, D.); 132 the meat they kill the following animals:—

Antelopes.

Kjikombo (D. *kwanngo*).—Blue duiker (*Cephalophus monticola*).
Mombo (D.).—Red duiker (*C. spec. incert.*).

[xiii] *Kwambura Kinjogoni.*

Kororoto (*myllocheilus mandibularis*) : honey-harvila.
Kiwuk : honey-harvila.
Kiwanyoni or *Tiwuki* (*afrex, alex chrysophylla*) : fire-wood.
Kiyuwuk : fire-wood.
Ceriat (bow sp.) : fire-sticks.
Dat (*pellis*, *platyrrae preuss*) : fire-sticks.

(b) *Plant materials*. The following trees and plants provide material for food, salt, medicines, and utensils[1]:

Kwiat (dry grass) : matter for making fire with fire-sticks.
† *Tuyawanyi* : fibre for baskets.
Kwiat (*phoenix reclinata palm*) : fibre for baskets.
† *Tiriat* : medicine.
† *Ngulo* : medicine.
Kororoto : medicine.
Lokyawuni : medicine.
Kiriwat : medicine.
Kiriwi : medicine.
Kiwat (*anthos sp.*) : medicine.
Tiyangiat (*aconitus integrifolius*) : salt.
Iwangiat : salt.
Kwiriwat or *Kwiria* (*bignia orthoptera*) : making honey-wine.

(c) *Horns and animal products*. These include :

† *Kwakuy* : food, clothing.
† *Iwangiat* : food, clothing, bags, quivers.
Tiyangiat : bow-strings.
Kwakuwa : arrows.
† *Kiwuy* : food, wax : ritual purposes.
Kwai's tor : ritual purposes.
Kwata : bride-payment : ritual purposes.
Lotia : bride-payment : cattle : dung : hides.
Kwak-kwak : cats for breeds.

The basket most commonly made by the Dorobo is the small bangle, about 4 inches deep and 4 ½ inches wide at the top. This kind of basket is used a good deal by the Nandi Akamotinu, and is also a frequent article of sale or exchange for the Kisumu Akamotinu Nandi. [illegible] for the Kisumu ... as are still women with Nandi women make baskets when they have nothing particular to do, just as European women knit. The materials used are fibre from the midrib of the wood palm, which is split into fine strips, and bark from a plant called *kipkwenet* which is used for sewing the ends of fibre with the aid of a small needle (Fig. 1). The basket maker starts by splitting the wood fibre, preparing a certain length and tying it all at the

[1] Those marked with a dagger (†) are used in the preparation of objects given to the Kisumu in exchange for their products.

[illegible]

the farm. Quivers are made of ox-hide, bow-guiver is made from the bark called *bäkt* (*svorvenfiberg bildningen*), the use of which the Finnish way was discovered by the Swedes.[1] It is made in this way: leaves and branches are broken off and boiled in a pot for several hours. The resulting liquid is strained and boiled again till it becomes thick and tar-like. When cool it is placed on a sheet of bark, covered with another piece of bark and put to a tree out of the reach of children, together with the pot in which it was boiled. After resting poison a man-eater partly towards by hanging to a cross. Kaka poisons quite very quickly, but does not make the whole of the animal killed by it unfit to eat. The Swedes consider the skin of every a not very well destroyed, and the rest is eaten with safety.

The Swedes used to have hunting dogs (*vallar, pl. vallir*) which at one time were the only animals they kept. They still have dogs, but the hunting breed which I met in the Bolgan-Kijkavomi area in 1937, seems to have died out for though I met a few dogs there in 1939, they were nothing more than the ordinary native type, the tide-reward not as common to Native Reserves and as fierce whenever Whites are heard. The original breed, as I saw it in 1937, had, it is true, a tightly curled tail, but was a much better looking animal, of a different shape, and much fiercer, resembling the so-called 'fierce' dog of the Belgian Congo.[2] more than anything else, especially in its prick ears, tail, and carriage, though it could bark. When in the forest, the Swedes put bastion collars on their dogs, with a small bell under the throat so that they could tell where the animals were when they got up game. It was noticeable both in 1937 and 1939 that the Swedes covered their dogs better than Whites usually do — they paid more attention to them, played with them, and loathed them.

The traps used by the Kijkavomi are of two kinds: the pit-trap, and the springe. The pit-trap, *njarok*, is simply an oblong pit about 4 to 5 ft. long, 1½ wide, and 4½ deep, dug with digging-sticks, and the earth removed in bags or baskets. Wooden spikes, *kijkavomiak*, were often put in the bottom, and the whole was covered with thin sticks concealed by a layer of grass and leaves. The trap was dug across a path known to be used by buffalo, the animal it was chiefly intended to catch. This type is no longer used. The springe is the only trap used today. It is called *jiemek*, and can be made in a very short time by almost any Swedes. It is used chiefly to catch smaller game like antelope. The materials required to make a springe are vines, bark, and grass, and the only tool used is an axe or *panga* (the long-bladed knife of native manufacture). [illegible] The trap shown to be described was made for me on the edge of the forest at Kijkavomi by Lisimbi-ang Kuruva on 1 July 1936. It took him about (illegible) minutes from start to finish, and did all that was claimed for it. It should be noted that he was somewhat out of practice, and probably took a little longer than a man who was constantly making traps.

000 /Semana I continued/ be a substantial therapeutic advance to be recorded here."
From "Über Anacardium Extingent als Mittel bei Hautkrankheiten/On Anacardium Gum Extingent as a Remedy for Skin Ailments." By L. Lewin and E. Guttmann. From a report delivered to the Berliner medizinischen Gesellschaft /Berlin Medical Society/. Berlin, 1910).

• 276 324 [434] Although the tree is not rare in the steppe around Kilimandscharo, its poisonous nature nevertheless generally seems to be known only to the Wandorobbo, since other tribes do not manufacture the poison themselves. Thus the former sell it, for example, to the Wakchaggo, the Wakamba, the Wakuafi of Aruscha (artist sent of Meyerberg /Mt. Meru/, the Wapare, etc. To have the poison two Wandorobbo always go a few thousand meters away from the camp into the bush. After they have collected branches and roots of Anacardium abyssinica, they split them into thumb-thick sticks and prepare for the cooking in separate places. The wood is boiled for several hours in an earthen pot that is half filled with river water. Then it is removed, and the liquid obtained is thickened by further cooking to a viscous porridge-like consistency. The finished poison is black and looks like pitch. 278 [434] During its preparation no woman may come either in the vicinity of the poison pot or in that of the man doing the cooking. The women who bring food and firewood therefore place these objects while calling distance. They believe that the effect of the poison is weakened or entirely destroyed through the contact or even merely the presence of a woman, whose person they, in their naïve beliefs, are unable to separate from the idea of sexual intercourse -- since the latter, according to their view, is an element acting against the poison. The same would be the case if the wife had intercourse with another man during the time the husband is busy preparing the poison, or if the husband cooked the poison while his wife was pregnant. The [415] finished poison is stored in a wooden pot (mwiki) or in a leather bag /bat/ (ngoko), and, to be sure, like the quiver with the poisoned arrows, not in the hut, but hung on a tree not far from the camp.

[illegible]

[illegible] G. W. S. Dunnagan.—Modern Eskimo: Some Account of

Bows.—These are made from the lesser (R.) tree, and average 3 ft. 1 in. in length. The string (sec. 9 c), which is made from the sinews of the great pig (seeals, 9 c), is tied to the bow (Text-fig. 4).

Arrows.—The bow heads (kigaktiqat) are bought from the South, and are usually of the fourth shape called kagdlaligaat (Text-fig. 5) and kigaluagat (Text-fig. 6) (R.S. Pigs. 91, 94). They are from 6½ ins. to 8 ins. long. They are always tanged, and are inserted to a slit made in the arrow-shaft (Text-fig. 8) and bound with fine or thin binding (seeals). The shafts are made of the saxifrage (saxifrage), ossetia, and loosestrife trees, and are of an average length of 2 ft. There are three feathers (tavvit), 9 c, which are split and trimmed, and fastened to the shaft by a spirally bound cord (Text-fig. 8). The shaft immediately above the feathers is bound with thin sinews, the notch (sarpa) is shortened, and bound over the shoulder with a thin sinew. The length of the feathers is 3 ins. to 3½ ins. Arrows are kept in a quiver (Text-fig. 10) (seeatsa 9 ; ekkigliat or kaitlen, and about 2 ft. 6½ ins. long with a leather cap and a sling for carrying it round the body. (For the position assumed by Dorothy for shooting with the bow, see D.S., (9, 11).)

Knives.—The iron blades are bought from the South. They vary in length from 4 ins. to 10 ins. and are about ½ ins. wide. The handles are about 6 ins. long of wood, with spiral inserts set in them, and covered with skin, which is pressed into the inserts as they dried through the skin. The knives are carried in leather sheaths (sikaksi, 9 c) which are attached to leather belts (sapainek, 9 c) (Text-fig. 9).

(B) Leather.

Skins are cleaned and smeared, and tanned, leather articles of clothing and bedding, quivers, sheaths and bags. The ordinary type of bag is called (seeksi). It is used for various purposes, including carrying bones ; the bones bags are for a crossing. Bags for carrying other things are made of envelope skin (e.g. kigaktiq, thin bladder) with the fur left on, and bags to store them, which are fastened by a thin cord and round the bag (Text-fig. 11). They are slung from the shoulders by a thin cord. Small bags are about 7 ins. by 6½ ins., others are larger.

(c) Bedskin Gauges (ß. kingaarik (9 c)).

These are made by the women. They resemble round bodkins of the same name. The upright sinews in the bodkins are called kigaarik ; the cross sinews, saalik (9 c ; Eskimo suitcase gates). The bodkins are flat and are made of skin, which is sewn to the sides. Some have a handle of skin. The average length of the bodkins is 4 ins., width at top 6½ ins (Text-fig. 12).

(d) Miscellaneous.

For carrying things in the house, a contraption called tuksuktiq (9 c) is used (Text-fig. 13). It consists of two oval objects connected by cross-pieces fastened

Kilbuiningland B-1 (1936-1938) 1951 PLA Dundee PLA

waste fl. i.e. on the bone and gets this, a sore and is shaved under the binding; the foot is kept lowly to a handle. The technique is a spiral basketlike with a flat, then gradually ascending coil, of the simple over-and-under type, and two-ply rushes, the stitches being spaced out and not close together. The base of the basket is formed of six fibre coils, sewn together with flax. A fold is made with the coils, and the flax is pushed through it. At frequent intervals the fibre and the flax are maintained with the lips when the first six coils, a slight rise is made: as each coil makes a complete circle it is slightly raised in order to make the bend between the base and the sides. When a new piece of flax is needed it is shaved right through the fold, leaving about ½ to 1 inch on the other side, and is sewn through as before. The basket maker works with lengths of flax of 6 to 10 inches. The fibre coil is of about the thickness of a pencil, and this must be maintained. When the length of fibre is reduced to about 3 ft. it begins to get thin, and some new strips must be added by shaving off a further length. The structure of the basket is thus, in effect, a continuous coil of compressed fibre, each line of coil tied to the next by stitches of flax. Sometimes the base is made of a circular piece of bamboo, to which the first coil is sewn, the rest of the procedure being the same as for the all-fibre basket.

The drawing of skins, including those used for exchange, is a simple process, for no stretched apart is applied. The newly flayed skin is lightly pegged out on the ground while it is still wet and left to dry in the sun. When dry, it becomes stiff, and in this state it is rubbed with an axe-blade held at an angle of about 30°, the blade being rubbed backwards and forwards on the skin to soft and supple. If it is to be used for a woman's garment or other object to which fur is not worthy, both sides are rubbed. Skins are dressed by women. Apart from clothing, the chief objects made of skin are bags, quivers and parts of tobacco-boxes. The material used for sewing is generally sinew. The needle of course has no eye, and the method of sewing is therefore to make a hole with the needle and then push the end through it. Bags are also used for many purposes, including the carrying of honey and tobacco-cakes. They are generally made of antelope skin or a fine leather, and sometimes for honey the fur is left on the inside. They are provided with a flap, a strap for fastening and a sling for carrying them from the shoulder. A common size is 7 ins. by 5 ½ ins., but I have seen them as big as 18 ins. by 15 ins. Tobacco-boxes are made from intermediate of bamboo, but they have leather covers at each end, and a thin leather strap is sewn to the covers so that the owner can sling the box round his neck.

The custom of Islands fill transacts exchange of products with the Swahili. The most important of the products they get by exchange is livestock; other things are pottery, beads, tobacco, wood, salt, cloth, and a fairly definite, though possibly fluctuating, scale of exchange values has come into existence. In 1936 some of these values were:

1 cow for 1 bag(s) of honey
1 woodcloth for a good bag of honey
5 metres for 1 day's wording to the Mushambi's dwelling.

[illegible] Service File

After breakfast the day's work begins. Pots have to repaired and resurfaced, for which branches and twigs for the bases, fuel for heating it, and long-armoured grass for covering the roof and lining the walls are procured. When the women are not busy with this, with cooking, with fetching water and gathering firewood, one usually see them sitting in the doors with some handwork. They are clothing, bags, basket covers for the coarser pots, cot straps, etc. Concerning the ornaments, the Wandaobe excite for themselves these things but the latest also excite for themselves they only buy the metal-forged work from latest blacksmiths. The working of the

Fig. 6. Pot

[illegible] earthen pots (Fig. 6) [illegible] to the women. From dark-grey clay (white) they shape the pot with their hands (without a wheel) and let it dry in the sun, after it has been decorated, usually with cord ornamentation. Before being fired, it is usually rubbed with dried grass pipe to bring per to a fine polish with dried cow hoof with which it is similarly covered and to which it sometimes add a wipe on a dark red color. The finished pot, to enter "to present a love-inviting living sac," is thoroughly heated on the hearth fire, and then boiling water, to which a bean has cooked, is poured in.

The dressing of the hides from the cow covers having been also taken a great deal of time. These consisted for sale are, of course, simply newly cleaned of all meat and fatty parts and then, pegged to the ground with sticks, dried in the sun. The others, however, which are to be used to make clothing, are worked and beaten in the way described for the latter. In them, the coarser

needle B, i.e. on the loose end goes this, a new end is doubled under the binding; the load is kept handy in a handle. The technique is a spiral [illegible] with a flat, then gradually expanding coil, of the straight even-wrap type, used two-deep routinely, the stitches being spaced out and not close together. The base of the basket is formed of six fibre rods, arrow together with heat. A hole is made with the needle, and the load is pushed through it. An [illegible] intervals the fibre and the load are maintained with the fish. After the first six rods, a slight rise is made - as each coil makes a complete circle it is slightly raised in order to make the bond between the base and the sides. When a new piece of load is needed it is shaved right through the hole, leaving about ½ to 1 inch on the other side, and is given through as before. The basket maker works with lengths of load of 6 to 12 inches. The fibre coil is at about the thickness of a pencil, and this must be maintained. When the length of fibre is reduced to about 2 ft. it begins to get thin, and some new strips must be added by shaving off a further length. The structure of the basket is thus, in effect, a continuous coil of compressed fibre, each line of coil tied to the next by stitches of load. Sometimes the base is made of a circular piece of leather, to which the first coil is sewn, the rest of the procedure being the same as for the all-fibre basket.

The dressing of skins, including those used for exchange, is a simple process, for no chemical agent is applied. The newly flayed skin is lightly pegged out on the ground while it is still wet and left to dry in the sun. When dry, it becomes stiff, and to this stage it is rubbed with an axe-blade held at an angle of about 20°, the blade being rubbed backwards and forwards on the skin in soft and supple. If it is to be used for a woman's garment or other object in which fur is not needed, both sides are rubbed. Skins are dressed by women. Apart from clothing, the chief objects made of skin are bags, quivers and parts of tobacco-boxes. The materials used for sewing is generally sinew. The needle of metal has an eye, and the method of sewing is therefore to make a hole with the needle and then push the gut through it. Bags, quivers, etc. used for many purposes, including the carrying of heavy and coherent earth. They are generally made of antelope skin in a [illegible] and [illegible] [illegible] for heavy life fur is left on the animal. They are provided with a [illegible] [illegible] one, a strap for hanging and a strap for carrying them from the shoulder. A common size is 1 ft. by 1 ft., but I have seen them as big as 3ft. by 3ft. Tobacco-boxes are made from [illegible] of leather, but they have [illegible] leather covers at each end, and a thin leather strap is sewn to the covers so that the owner can sling the box round his neck.

The system of [illegible] still [illegible] exchange of products with the Ovaldi. The most important of the products they get by exchange is livestock; other things are pottery, [illegible], wood-work, and cloth, and a fairly [illegible]. Interview #18
[illegible]

[illegible]

[illegible] is dolomite, i.e., huts of the ovambo[illegible] men, in contrast to the [illegible] is ombanja, the camp of the ovambo. Therefore here, too, we find, even in the camps, a separation into [illegible] of the ovambo and [illegible] of the ovambo, similar to the one mentioned for the ombanja.

The arrangement of the interior of the hut, like the form itself, resembles that of the ombanja to [illegible]knowledge, however, on even smaller. A heavy pot (ombili, ombilongo), a gourd bottle (ongati) for drinking water and [illegible] beer, a leather bag (ombanda, ombanda) for collecting honey, a larger one (ombanda, ombanda) for water, a few earthen pots, larger ones (ohia, ohia) and smaller ones (ongaka, ongaka) for cooking, a couple of wooden bowls (ongi), a rope net out of an animal skin (ombanda, ombanda) in to up the dish mash, a cord ordered out of the hair fibers of the tschani (ombanda ombanda) for the lowering up and letting down of the bedsteds long in case (ombanda), along with a few adjacent skins (ombi) that serve as beds, as well as an [illegible] (ombanda) and knife (ombanda), constitute the principal household equipment. In a few huts one also finds the [illegible] (work-holders) of the ombanda, here called ombanda (ombanda), as well as a hammer (ombanda) for forging and a chisel for designing the ornaments (ombanda, ombanda), and finally that instrument most piece of them are serving as water bowls (ombanda, ombanda). The entire family, namely, husband, wife or wives, and the [illegible] children, live in one [illegible] hut. Men and boys, however, are usually not. The day begins even before daybreak for the hunting men. They [illegible] up and with a small [illegible] of a little piece of boiled or roasted meat, so that the first light of day already finds them in the hunting grounds. The game are [illegible] bait, as they say. A day [illegible] more eagerly and cautiously than a few hours later, when the sun already becomes annoying to it. As daybreak women and children leave the huts [illegible] and [illegible] an [illegible] up in order to visit the most [illegible] from a [illegible] bedsted to a nearby one. The [illegible] a bed there and sat in the [illegible], so that it hangs in the air and thus [illegible] from [illegible]. After that the morning meal is eaten. Normally the [illegible] do not have [illegible] [illegible] as long as there is something edible they simply eat as long as they can.

[illegible]

[illegible]

[illegible]

The two openings are closed [illegible] by [illegible] [illegible] fitting [illegible] the opening, [illegible] each of which [illegible] [illegible] [illegible] [illegible] the [illegible] [illegible]. The hanging, [illegible] [illegible] [illegible] [illegible]

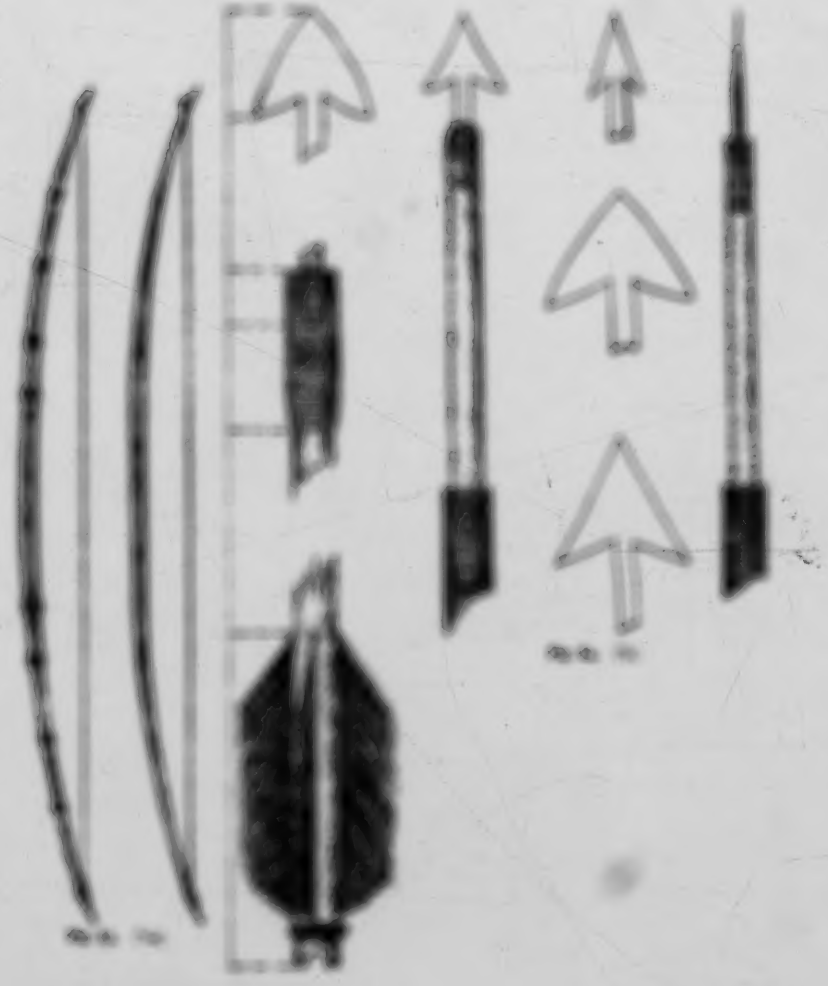
[illegible]

[illegible]

[illegible]

[illegible]

[illegible]



Self-living alone on the Downs. The only weapon is the bow, invariably called the Dwindle (also Dwindle) from the Dwindle tree (Dwindle sp.). It is about 5 ft. long, and the beginning, with a depth from part of the great ply wood. Dwindle-wood are made from the hornbeam and valuable trees, or Elm timbers, obtained under bonds are bought from the Dwindle, and are of the Dwindle gateway. Arrows are carried in quivers made of hide. Arrow points a made from the native bone (pronounced Arrowpoint).

Dwellers

Making Dwellers, Dwellers is a common occupation of Dwindle women. They are made from bone of the gathering Dwindle plants, shells and even milk bone made from the plant called Dwindle. The technique is a spiral incorporated with a flat base particularly resembling one of the straight over-and-in type and two-step variety, the interior being spiraled out and the sides together.

Miscellaneous

Salt used is by mostly from the ashes of the plant Dwindle Dwindleflora, that and white earth is found near Dwindleton on the east of the Dwindle country, and also up to quarter of four or five to day is carrying home the work in large leather bags, mostly to order or sell it in the Dwindle area, to Wolf, gave them 20, a bag. Both work, Dwindle to assort with for or spoken of for nothing on the back, white earth, counter bag dwelling-religious ware. For carrying a number of small objects a carrying net called Dwindle is used. It is made of a pair of cord rope 2 ft. 6 ins. long and plenty of bass stretched across them, concerning something a pair of Dwindleton small animals. These are sometimes used by the Dwindle.

Spirits and Demons

Religion

Dwindle the sun, is recognized as a being that can supply or withhold the needs of people. And, please goodness, they did so with need. It is sometimes pleased, Dwindle Dwindle, it is believed that there is a being called Dwindle, who produces rain, and the rainbow is the sign which shows up more for rain. The Dwindle also believe in spirits, good and bad, both of which are called Dwindle, a word which includes the still unnamed spirits and ancestors and spirits of the Dwindle. The ancestral spirits have the same significance and functions as those of the Dwindle, and though they protect the living for doing evil, they are otherwise friendly and only the living, according to the beliefs of elders, both to see their people and to get food in the form of Dwindle (living and insects) spirit-snakes should not be killed.

Divination

The Dwindle appear to have no divisions of their own, and when they have reasons to divination, as in cases of illness or witchcraft, they go to Dwindle Dwindlers of the type called witch-doctors by whom they are charged a small fee. The people called witch-doctors (or witch) among the Dwindle are no more than healers or physicians who prepare healing medicines from trees and plants. Although the Dwindle have a reputation among other tribes as powerful rain-makers, they themselves say that they have no rain-makers, which is probably true.

Death and Burial

Very old men and women are looked to survive bodies about 3 ft. deep in which the bodies are laid full length wearing their clothes over grave after an old man's death his children place a bunch of Dwindlewood (Dwindle sp.) on his grave and let it grow. Other people are laid out like the Dwindle, body resting on the right side with

Huntingford E-5 (921-928)529 FLA Dorobo FLA

411 *Bows.*—These are made from the lenkot (K.) tree, and average 5 ft. 1 in. in length. The string (net, K.), which is made from the entrails of the giant pig (ewoin, K.), is tied to the bow (Text-fig. 4).

[511] [512] *Arrows.*—The iron heads (kipsikijet) are bought from the Nandi, and are usually of the Nandi shapes called chepkilakjet (Text-fig. 5) and kipchepet (Text-fig. 6) (H.N. Figs. 69, 70). They are from 2½ ins. to 4 ins. long. They are always tanged, and are inserted in a slit made in the arrow-shaft (Text-fig. 5) and bound with fibre or skin binding (ewoiko). The shafts are made of the sosiyet (*Senecio*), tumbiis, and kemsupsiiet trees, and are of an average length of 2 ft. There are three feathers (kerorik, K.), which are split and trimmed, and fastened to the shaft by a spirally-bound cord (Text-fig. 6). The shaft immediately above the feathers is bound with skin strands; the notch (nesin) is shouldered, and bound over the shoulder with a skin strands. The length of the feathers is 2 ins. to 2½ ins. Arrows are kept in a quiver (Text-fig. 10) (*mosiot* K.; *sabukjet*) of leather, and about 2 ft. 3½ ins. long, with a leather cap and a sling for carrying it round the body. (For the position assumed by Dorobo for shooting with the bow, see H.N., Pl. VII.)

412 *Knives.*—The iron blades are bought from the Nandi. They vary in length from 9 ins. to 12 ins., and are about 1½ ins. wide. The handles are about 5 ins. long, of wood, with spiral marks cut in them, and covered with skin, which is pressed into the marks so that they show through the skin. The knives are carried in leather sheaths (*sheket*, K.) which are attached to leather belts (*ngoiwet*, K.) (Text-fig. 3).

(3) Leather.

201 Skins are dressed and trimmed, and furnish, besides articles of dress and bedding, quivers, sheaths and bags. The ordinary type of bag is called *mutsket*. It is used for various purposes, including carrying honey; for honey-bags, the fur is preserved. Bags for carrying other things are made of antelope skin (e.g. *kipunket*, blue duiker) with the fur left on, and flaps to shut them, which are fastened by a skin cord tied round the bag (Text-fig. 12). They are slung from the shoulders by a skin cord. Small bags are about 7 ins. by 6½ ins.; others are larger.

415

[210] (4) Baskets (*kempet*, pl. *kempunik* (K.)).

205 [206] These are made by the women. They resemble Nandi baskets of the same name. The upright straws in the baskets are called *tepserik*; the cross straws, *mulk* (K. = *Phoenix reclinata* palm). The bottoms are flat and are made of skin, which is sewn to the sides. Some have a handle of skin. The average depth of the baskets is 6 ins., width at top 6½ ins. (Text-fig. 11).

(5) Miscellaneous.

413 For carrying things in the forest, a contraption called *lebwalet* (K.) is used (Text-fig. 13). It consists of two oval objects somewhat like tennis-rackets fastened

823 *Kwondet* (*euphorbia candelabrum*) : honey-barrels.
824 *Mwet* : honey-barrels.
Okwenjwet or *Yondit* (*olive, olea chrysophylla*) : fire-wood.
Kaynetuk : fire-wood.
Cowet (*ficus sp.*) : fire-sticks.
Tet (*cedar, juniperus procera*) : fire-sticks.

824 (B) Plant material. The following trees and plants provide material for food, salt, medicines, and utensils*:

[372] *Sweet* (*dry grass*) : tinder for making fire with fire-sticks.
• [355] † *Tajwarwet* : fibre for baskets.
[370] *Sweet* (*phoenix reclinata palm*) : fibre for baskets.
† *Tirwet* : medicine.
† *Ojwin* : medicine.
Kwondet : medicine.
Lelwyon-et : medicine.
Sirotwet : medicine.
Sokwet : medicine.
Cowet (*aloinia sp.*) : medicine.
[363] *Tajwogwet* (*aeroilia integrifolia*) : salt.
Sworogwet : salt.
[372] *Kotiwet* or *Kotit* (*kigelia aethiopica*) : making honey-wine.

825 (C) Skins and animal products. These include :

237 † *Monkey* : food ; clothing.
[371] † *Antelope* : food ; clothing ; bags ; quivers.
[411] *Pig-gut* : bow-strings.
Feathers : arrows.
† *Honey* : food ; wine ; ritual purposes.
Rat's fat : ritual purposes.
[373] *Goats* : bride-payment ; ritual purposes.
[372] *Cattle* : bride-payment ; milk ; dung ; hides.
Bush-buck : hide for breeches.

225 The basket most commonly made by the Dorobo is the small *kenjet*, about 4 inches deep and 6 ½ inches wide at the top. This kind of basket is used a good deal by the Dorobo themselves, and is also a frequent article [439] of sale or exchange to the Nandi : *kenajet kenyasiek Nandi*, "we make baskets [361] for the Nandi", as an old woman said. Dorobo women make baskets when they have nothing particular to do, just as European women knit. The materials used are fibre from the midrib of the sweet palm, which is split into thin strips, and bast from a plant called *tajwarwet* which is used for sewing the ribs of fibre with the aid of a small needle (Fig. 1).[2] The basket maker starts by splitting the sweet fibre, preparing a certain length and fitting it all as she

[439] * Things marked with a dagger † are used in the preparation of objects given to the Nandi in exchange for their products.

[2 Lit. see autopsy 116 p 691 - Annoyot.]

made 6, i.e. as the bone and gets hide, a bone awl is shown under the binding; the tool is kept handy in a handle. The technique is a quick overhand stitch with a fine, thin gradually unwinding awl, of the simple one-piece type, and two-step variety, the stitches being spaced out and not close together. The base of the basket is formed of the fibre cords, sewn together with hide. A hole is made with the awl/s, and the hide is pushed through it. An ornament intervals the fibre and the hide are maintained with the hide when the two are cords, a slight rise is made: as each cord makes a complete circle it is slightly raised in order to make the level between the base and the sides. When a new piece of hide is needed it is shaved right through the hide, leaving about $\frac{1}{2}$ to 1 inch on the other side, and is sewn through as before. The basket makes works with lengths of hide of 6 to 12 inches. The fibre cord is of about the thickness of a pencil, and this must be maintained. When the length of fibre is reduced to about 1 ft. it begins to get thin, and some new strips must be added by shaving off a further length. The structure of the basket is thus, in effect, a continuous coil of compressed fibre, each line of coil tied to the next by stitches of hide. Sometimes the base is made of a circular piece of leather, to which the fibre coil is sewn, the rest of the procedure being the same as for the all-fibre basket.

The dressing of skins, including those used for exchange, is a simple process, for no chemical agent is applied. The newly flayed skin is lightly pegged out on the ground while it is still wet and left to dry in the sun. When dry, it becomes stiff, and in this state it is rubbed with an axe-blade held at an angle of about 30°, the blade being rubbed backwards and forwards till the skin is soft and supple. If it is to be used for a woman's garment or other object on which fat is not needed, both sides are rubbed. Skins are dressed by women. Apart from clothing, the chief objects made of skin are bags, quivers and parts of tobacco-boxes. The essential need for sewing is generally pig-gut. The needle of course has no eye, and the method of sewing is therefore to make a hole with the needle and then push the gut through it. Bags, sometimes used for many purposes, including the carrying of honey and coloured earth. They are generally made of antelope skin (e.g. blue duiker), and when intended for honey the fur is left on the outside. They are provided with a flap, a strap for fastening and a strap for carrying them from the shoulder. A common size is 7 ins. by 4 $\frac{1}{2}$ ins., but I have seen them as big as 10 ins. by 16 ins. Tobacco-boxes are made from intermodes of bamboo, but they have leather covers at each end, and a thin leather strap is sewn to the covers so that the owner can sling the box round his neck.

The system of Ovimbo life demands exchange of products with the Ovandi. The most important of the products they get by exchange to transmit; other things are pottery, beads, tobacco, cured meats, and cattle, and a fairly definite, though possibly fluctuating, scale of exchange values has come into existence. In 1919 some of these values were:

1 ox for 1 bagful of honey.
1 smoothaxe for a gourd full of honey.
2 knives for 1 day's wooding at the blacksmith's shambo.

Fig. 1. Dog-net (Kwoma type).

When a man gets up a new bunya-barrel, he calls out to the boys to come and settle in it.[1] The invocation to lure him is set forth, and is uttered in a rather undistinct, high-pitched tone:

[illegible]

Boys do not get ill, they say, but are liable to be killed by bunya-rats. If they are caught in a storm while getting bunya they have also a mention

[1] Two reasons take off from a bee colony when it becomes congested. Young queens are allowed to develop, and the old queen leads off a swarm to find a new home.

[2] This obscure expression is said to be equivalent to *Hayaw ye*, "come here".

[3] The Tumbi have borrowed this formula, and attempt it in their imitative manner as follows, "*Hoiyo ye, gwar woo lolo tha wawa bua*".

knowledge of roots, leaves, berries and tubers of all kinds, as many of which he is capable of supporting life.

Various kinds of honey are obtained in large quantities and [illegible] commercial [illegible] trade with among the Bhotiá, who are, for the most part, too indolent to look for honey themselves. The Bhotiá are greatly assisted by the honey-bird [1] in their search, and do not appear to suffer much inconvenience when stung. The honey is generally removed by hand, the inspector smoking gleefully to a chorus of angry, stinging bees. Occasionally a nest has to be felled, and in some cases the honey may be so inaccessible that fire has to be resorted to for the purpose of driving the bees away. Thick shoals of smoke are readily produced by the use of the Himálaya [2] which every Bhotiá carries in his quiver.

With regard to the dress of the men, the Bhotiá are seldom to be found wearing skins. I have seen Bhotiá wearing a single garment of rough hemp-cloth, knotted at the shoulder in the manner of the Bhotiá blanket, but as a general rule their dress consists of a rugged strip of 'kamlikoti' or blanket, reaching down to the extremes, tied over one shoulder and confined at the waist by the sword-belt. They say that they no longer wear skins because the bites made by moth exist in the hair, and leave their chances of approaching close to game. The women wear a skin garment [3] of the same kind as that worn by the Bhotiá women. They also wear anklets and armlets of wire, but the heavy iron necklaces and 'cowrie' earrings of the Bhotiá women are seldom, if ever, seen. To very

[1] *Cuculus indicator* – a small dark bird about the size of the thrush. It has a short, but very sharp, bill, a white underside and black-striped wings. Its distinctive call-note is often heard in the hills, particularly in the vicinity of bee-hives and other places where honey is to be expected to be found. It flies from tree to tree, keeping up its twittering all the time, and is obviously anxious to be followed. I have followed this bird several times, and although honey was not always found at the end of the quest, it invariably led us to places where bees were or had been some time before. The Bhotiá always marks the site of his bee, even when they have no opportunity of following it. There are many legends about the honey-bird, which, I think, is to be met with throughout East Africa. The Swahili call the bird *Indi*, the Masai call it *Enjokonu*, the Bhotiá name it *Cherkwallo*, the Hindi, *Chakhoda*.

0800 Clothing and adornment. — Cloth materials. — The individual articles of clothing and adornment, compared with those of the Ahaggar. — Head and body hair. — Stain. — Painting. — Tattooing.

4[illegible]
6[illegible]
1[illegible]

Cloth materials, such as are the modes of the caravan peoples in the Sahara trade, have been adopted only to an extremely slight extent among the Aoï. The principal reason for this is that they only rarely come into direct contact with the caravans either, unless pressure from the Ahaggar, [illegible] they are forced to deliver to them their yield in elephant tusks, hippopotamus teeth, and horns of Abissinian bisontes for a small compensation. There is no question of a legal barter under the Ahaggar tax [illegible] with Barca, as the coastal peoples so aptly designate the type of trade.

• 291
191

One therefore sees the Aoï almost solely in their original leather clothing (hide worked into leather, [illegible], [illegible], which, in cut and manner of wear, is identical with that of the Ahaggar, but lacks power and often ragged. This poverty is particularly noticeable in the boys' and many [illegible], called a [illegible] and an [illegible] by the Ahaggar, which the Wandalâba name the same, and which here are also worn by older men because in [illegible] the [illegible] is too inconvenient because of its length. The [illegible] otherwise do not generally wear the a [illegible], rather more often an [illegible] made of calf hides, which they buy from the Ahaggar; older men often have it made out of the hide of the female black-haired antelope. The costume of the women is here called [illegible] (pl. [illegible]), as in the upper part of it (at [illegible] of the shawl) by itself, while the lower one is named after the Ahaggar designation [illegible] (pl. [illegible]). The [illegible] of [illegible] of [illegible] is here called [illegible] and is considerably shorter than the former, only a little longer than the [illegible]. Sandals ([illegible]) serve them as footwear, which, however, in general are not used. In adornment the poverty of the Aoï is shown particularly among the [illegible], though one must also consider that their desire for favor in the eyes of the fair sex is, as a result of circumstances, very considerably less than

MODERN HUNTERS.

/233 cont./

512 After breakfast the day's work begins. Huts must be repaired [356] and renovated, for which branches and twigs for the frame, bast for binding it, and long-stemmed grass for covering the roof and [462] lining the walls are procured. When the women are not busy with this, with cooking, with fetching water and gathering firewood, one usually sees them sitting in the shade with some handwork. They [294] sew clothing, bags, leather covers for the wooden pots, cut straps, [281] etc. Concerning the ornaments, the Wandorobo make for themselves 306 those things that the Masai also make for themselves; they only buy 439 the metal-forged work from Masai blacksmiths. The making of the 323 462

Fig. 81 (1/10)

ball-shaped earthen pots (Fig. 81) falls to the women. From dark-gray clay (anjet) they shape the pot with their hands (without a wheel) and let it dry in the sun, after it has been decorated, usually with cord ornamentation. Before being fired, it is usually stuffed with dried grass prior to being put in a fire made with dried tree bark with which it is entirely covered and in which it remains until it takes on a dark red color. The finished pot, in order "to protect it from cracking during use," is thoroughly heated on the hearth fire, and then boiling water, in which a bone has cooked, is poured in.

281 The dressing of the hides from the most recent hunting booty also takes a great deal of time. Those intended for sale are, of course, simply nicely cleaned of all meat and fatty parts and then, pegged to the ground with sticks, dried in the sun. The others, [171] however, which are to be used to make clothing, are worked into 000 leather in the way described for the Masai. As there, the tanned

/233 cont./ As there, the tanned hides are sewed into articles of clothing with an awl (maramacog) and a thread twisted out of animal tendons (asug). If a number of hides for which, at the moment, one has no need for one's own use has piled up, a few old men with women and children, laden with skins and also steppe salt, set out for a neighboring area. Where the distance between this and the Wandorobo camp is such that it permits frequent trade, these caravans appear at the regularly held markets. If, however, they are able to come only rarely, they peddle their wares, inasmuch as, out of ignorance of time reckoning, they do not wait for the market days. They readily find customers, since both articles are very much in demand. The agriculturalist principally dependent on a vegetable diet always needs salt, but he can only rarely extract it himself, since as a rule the arable soil contains no salt or such not in sufficient quantities. The need for hides /234/ is also often greater than the local production, even today when fabrics have largely replaced the leather clothing. After protracted haggling, an agreement is finally reached, and the Wandorobo, satisfied, set out for home with the bartered vegetables. If the hunting was sometimes particularly lucrative or if an elephant or rhinoceros was killed, part of the meat would also be sold to the always meat-hungry agriculturalists. Many of the latter, for example, the Wataita and Wakambe, also buy the meat of predatory animals from the Wandorobo, others disdain it altogether, and therefore, in trading, they test each piece for smell and taste.

Old men, who only now and then in the evening lie in wait for game at a watering place, devote themselves outside the camp especially to the checking and supervision of the beehives (Fig. 82), a large number of which hang within an hour's range. These are wooden tubes 120 centimeters long and /Fig. 82 appears here/ 30 centimeters thick, with an interior breadth of about 25 centimeters. They are made by hollowing out a correspondingly long piece of tree trunk, a very arduous task because the tools are so primitive. After the trunk, through hewing with an ax, appears circular in cross-section and tapered at both ends, it is smoothed on the outside with a knife (pandyug). Two instruments are used for the hollowing out

cide, adultery, and assault. In the first category, incest is punished under the authority of the clan council: the man is beaten, his hut burnt, his honey-barrels destroyed; the woman also is beaten. Witches might be killed under authority of the *koret* council. In cases of persistent disobedience to the council, the elders could call upon two or three men to force the offender, by moral and physical persuasion, to mend his ways. Of offences in the second category, trespass has already been mentioned (p. 58). Theft, when not dealt with summarily, can be brought to the *koret* council, which can order payment of compensation. A man accused of stealing food may say, "If I am a thief, may this grass eat me," and place a blade of grass between his teeth. Adultery might be punished by the injured husband, who, if he killed the offender, had to pay blood-cattle. If a man incapacitates another by assaulting him, he must feed him till he recovers. Homicide of a Dorobo of another clan, though not involving primary sanctions, was a serious offence because it meant that the murderer had to get cattle in order to pay compensation. The usual number was nine head of cattle, though when the murderer was a very poor man living alone the number might be reduced. The kind of cattle (male or female) did not matter. The murderer had to provide as many as he could, from his own herd if he had one, or by exchange from the Nandi, or by any other means, including theft. The deficiency had to be made up by his fellow-clansmen.

Summary

The Dorobo horde consists of a loosely integrated group of districts held together partly by the feeling that they are all Dorobo, but much more by the clan ties which cut across the district boundaries. The clan is therefore one of the chief institutions in the life of the Dorobo.

MAIN CULTURAL FEATURES

Crafts

Housing

(*a*) Forest type: the *koconget*, in use as late as 1927, was a framework of sticks bent over to form an oblong, dome-shaped structure, covered on the outside with banana leaves and leaves of trees; height, 6 ft.; length, 11 ft.; width, 7 ft. (*b*) New types: the *keriet* has a circular wall about 5 ft. high plastered with mud, and an almost flat thatched roof supported by a centre post; the *kot* is a hut of ordinary Nandi type, the walls of which are occasionally left unplastered.

Settlements in the forest, consisting of three or four *koconget* huts, were situated in clearings just big enough to hold the huts, and were approached by concealed paths which branched in a bewildering manner that made it impossible to find them without a guide. Settlements outside the forest are arranged in small groups usually close to the cultivated land.

Dress and Ornaments

Clothing is made largely from the skins of wild animals, and the forms are mainly copied from those of the Nandi, as are most of the ornaments, which include, among other things, iron wire armlets and leglets, necklaces, and married women's ear-rings (*taok*). The ear-lobes are pierced and elongated (sometimes getting torn in the forest), and a small hole is bored in the top of the ear. Some but not all remove the two lower middle incisors. Hair is allowed to grow to a length of about 2 ins., when it is sometimes covered with a bladder cap, and sometimes dressed with red earth and fat. Occasionally a man has his hair done in pigtails like the Nandi.

Tools and Weapons

Axes and knives are obtained from Nandi smiths, the Dorobo making the wooden handles. Needles are made from old nails and bits of wire which the Dorobo

knowledge of roots, leaves, berries and tubers of all kinds, on many of which he is capable of supporting life.

Various kinds of honey are obtained in large quantities and they command a ready sale among the Masai, who are, for the most part, too indolent to look for honey themselves. The *Mósiro* are greatly assisted by the honey-bird [1] in their search and do not appear to suffer much inconvenience when stung. The honey is generally removed by hand, the despoiler working placidly in a cloud of angry, stinging bees. Occasionally a tree has to be felled, and in some cases the honey may be so inaccessible that fire has to be resorted to for the purpose of driving the bees away. Thick clouds of smoke are readily produced by the use of the *Endulee* [2] which every *Mósiroi* carries in his quiver.

With regard to the dress of the men, the *Mósiro* are seldom to be found wearing skins. I have seen *Mósiro* wearing a single garment of rough bark-cloth, knotted at the shoulder in the manner of the Masai blanket, but as a general rule their dress consists of a ragged strip of "Amerikani" or blanket, weather-worn in the extreme, tied over one shoulder and confined at the waist by the sword-belt. They say that they no longer wear skins because the latter make too much noise in the bush and lessen their chances of approaching close to game. The women wear a skin garment [3] of the same kind as that worn by the Masai women. They also wear anklets and armlets of wire, but the heavy iron necklaces and *'surutya* earrings of the Masai women are seldom, if ever, seen. It may

[1] *Cuculus Indicator*: a small drab bird about the size of the thrush. It has a short, but very sharp, bill, a white underside and black-striped wings. Its distinctive twittering is often heard in the bush, particularly in the vicinity of bush paths and other places it knows are likely to be frequented by humans. It flies from tree to tree, keeping up its twittering all the time, and is obviously anxious to be followed. I have followed this bird several times, and although honey was not always found at the end of the trail, it invariably led us to places where bees were or had been some time before. The *Mósiro* always answer the cries of this bird, even when they have no opportunity of following it. There are many legends about the honey-bird, which, I think, is to be met with throughout East Africa. The Swahili call this bird *Sego*; the Masai call it *En-jokóroi*; the *Mósiro* name it *Chekeandes*; the Nandi, *Chophecho*.

[3] *Ol-okesendi* (Masai).

2: Maguire G-5 (ca. 1926) 1927-28
FL6 Dorobo FL6

be that their absence is in many cases due to poverty. The *Mósiro* women follow the unusual custom of the Masai women in shaving their heads.

The younger generation of the men ape the Masai in wearing pigtails and dress like them when they can. They are addicted to the use of *Ol-kária* [1] and will, in time, be absorbed by the Masai. A few of them are now working as herds for various Masai, and, as I have said before, others have begun to follow a pastoral life with their own small herds.

All the *Mósiro* speak Masai, but many of them do so very imperfectly. No Masai that I have met can speak the *Mósiro* tongue, though Masai who have come in contact with the Nandi tell me that the language spoken by the *Mósiro* to-day seems vaguely reminiscent of the Nandi speech. Reference to the lists of numbers given elsewhere will show the marked similarity there is between the numerals (up to five) in the Nandi, Suk and *Mósiro* tongues.

The language of the *Mósiro* is dying, as any language except Masai tends to do in the Masai country. I have asked many *Mósiro* to give me the names of various common objects, and I have often been given a Masai name, my informant protesting that he knew no other. In the case of the numerals, it would seem to be a moot point as to whether the *Mósiro* tongue originally possessed numerals up to seven only and borrowed the remainder from Masai, when usage demanded, or whether the numerals from eight onwards have fallen into disuse and have been replaced gradually by the Masai words.

The physical make-up of the *Mósiro* is good. They are, as a rule, tall and lithe and are in many cases more muscular than the Masai. The pigmentation of their skins varies from a light, clear brown to a black almost Nubian. There would seem to be differences between them and the Masai in the formation of the jaw-bone and the zygomatic arch. I have had neither instruments nor training to enable me to undertake a series of anthropometrical measurements, but I think it is safe to say that many *Mósiro* have high cheek-bones and

[1] A mixture of red ochre and mutton fat, smeared all over the body and patterned on the legs, arms and face. It seems to be in use among nearly all Nilotic tribes.

prepare food and wait upon the men, themselves eating when the men have finished. At the present day the Dorôbo are taking to eating eleusine grain, which is crushed on grindstones (*listto*, N.) and made into a sort of porridge; and milk, which they obtain from Nandi, if there are any near them. Beer is made from honey, and is called *kipheñsik* (N.). Tobacco (*tumatet*, N.; or *chepkochôtit*,[1] N.) is bought from the Nandi, and is taken by men, and occasionally by women. It is either chewed (*mit*, N.) or smoked in Kavirondo pipes (*terênik-ap-tumatet*, or *kwesînik*, N.), which are also obtained from the Nandi. The men carry tobacco in cylindrical boxes called *kiprawit* (N. *kiprast*) (Text-fig. 22), made from sociyat (bamboo), with skin coverings for the ends, to which are attached thin leather thongs, by which the box is slung round the neck.[2]

Agriculture and Stock.

Formerly the Dorôbo possessed no stock, nor did they till the ground. During the last quarter of a century or so a few of those living on the edge of the forest have taken to cultivating small plantations (*imbaret*, N.), in which they grow eleusine grain (*olbaiek†*, or *paiek*; N. *pêk*) only. A few possess, at the present day, one or two cows; others have a few goats and sheep; no one has more than 5 to 10 head. The only animals they possess in numbers are dogs.

Dress and Ornaments.

(i) *Males.*—Boys wear skins of antelopes and monkeys (*akuriet*; N. *inguriet*). Warriors wear skin garments of duiker (*ngemowyo*,[3] N.) called akuriet; they wear leg-bells attached to a leather band (*mpitiko*,[3] pl. *mpitikoñsiek*) on the ankles. Nowadays some wear pieces of cotton-cloth (*anget*, N.) dyed brown.[3] Old men wear bush-buck skins (*akuriet*) with the fur left on. Caps (*engeruit†*) are worn, of blue duiker skin with the fur left on, by old men, and of cotton-cloth by warriors. Belts (*entoreit†*) of leather are worn by old men, and of beads by boys and warriors. Necklaces of chains (*sirimdo*, N.) or iron-wire (*asingait*, N.) are worn; also various kinds of iron ear-rings (*olaimeriat†* and *kimeitaiit* (Text-figs. 13–17); N. *kimeiteitiot*) are worn by warriors and elders.

(ii) *Females.*—The dress of the women and girls is very similar to that of Nandi women. They wear skirts (*chepkaiyuit*; N. *chepkowit*) and upper garments (*koliket*, N.), both of tanned leather, with the fur removed, in the same manner as the Nandi women. Their ornaments consist of iron-wire armlets and leglets (*makirarênik* and *kurik*, N.), and wire necklaces (*asingait*, pl. *asingañsiek*, N.). Married women wear

[1] *Chepkochotit* means "snuff" in Nandi.

[2] These are similar to the Nandi tobacco-boxes, from which indeed they are probably borrowed.

[3] As do the Nandi, from whom doubtless the custom spread to the Dorôbo.

3:Huntingford E-5 (1921-1928)1929 FL6 Dorobo FL6

291
30 large discs of brass wire (*tast*, pl. *tatik*), which are hung from the ears by leather straps (*muilto*; N. *muito*), to which are frequently fastened one or two cowries (*sekerick*; N. *sekerok*) (Text-fig. 18). These ear-rings are, as among the Nandi, the sign of marriage. Girls wear skins (*akuriot*) or cloth (*suget*). They have armlets (*lurik*, N.) and leglets (*ndapaluet*; N. *tapaluet*) of iron-wire, and necklaces of wire or beads (*ssingait*). The edges of skin garments, both of men and women, are generally trimmed and stitched.

Mutilations of the Body.

304 (a) *Ears.*—In both sexes a small hole (*ingoberit*; Kony *ingoberit*) is bored in the top of the ear. This among the Nandi is the tribal mark, and it seems to be so among the Dorōbo. Both sexes also pierce the lobes of the ears, and elongate them by inserting cylindrical blocks of wood (*ketik ap iitik*, N.), as among the Nandi.
[301] Ear-rings are hung from the lobes, which in the case of men are often broken by being caught by branches in the forest.

(b) *Teeth.*—Some Dorōbo remove the two middle incisors of the lower jaw, like the Nandi and other tribes; others do not. This is done, they say, "*si ko-kuroon-it piik*" (in order that people may become beautiful).

(c) *Sexual Organs.*—Circumcision and clitoridectomy are practised. (*See* V, "Circumcision.")

Hair.

302 Men wear their hair moderately long; they put oil and red clay (*ngurnet*, N.) on the hair, which sometimes becomes matted, as seen often on Nandi, particularly women. The head is shaved periodically. Boys put red clay and oil on to the shaved head. Both old men and senior warriors wear beards and moustaches, though to no greater extent than the Nandi. In some old men the beard is seen trimmed and pointed. Girls and women shave their heads periodically, and put oil on the shaved heads.

Paint.

Warriors paint their legs with red and white clay, as do the Nandi; they also put red clay on their heads.

Arts and Crafts.

325 The Dorōbo have few crafts of their own. They have no knowledge of metal-
[439] lurgy, and there are no smiths; all their ironwork is obtained from the Nandi.

(a) Weapons of Chase and War.

411 These consist of bows (*kuyuāgda*), arrows (*kōtiek*, *kiperēnik*, *kipchāponik*, N.; and *mbunatit*); spears (*olmorondoit*† or *morondoit*†); swords (*wesekto*; or *rotuet*, N.); shields (*loāget*, N.); and knives (*chamboluet*, N.). Spears, swords, and shields are obtained from the Nandi.

3:Huntingford E-5 (1921-1928)1929 FL/ Dorobo FL6

When a man is ill and dies, it is said that bad oiik (*oiik he yuek*, N.) have killed him; if he recovers, a good oiindet has saved him. No offerings are made to the bad oiik.

There is also a vague belief in a future life. A man's spirit is said to go at death to the *kuret ap oiik* (N.), or land of the spirits, which is under the earth, and is a bad place.

Magic.

There are magicians (*yondindet*, pl. *yonik*, N.) who are bad, and who prevent people from getting food by means of their spells. There are also diviners (*orkoiyot*, pl. *orkoiik*, N.).[1] There is no equivalent of the modern Nandi system of "orkoiyotet" or rule by a medicine-man.

Medicines and Charms.

(a) *Medicines.*—For snake-bite, the gum of the tinet tree is used, mixed with the honey of a species of bee, called "kosomyot" (N.), and ram's fat. This concoction is rubbed on the affected part, and a little is also eaten. For coughs, a plant called "opojo" is chewed; this is used for all chest complaints.

(b) *Charms.*—Children wear a charm to ward off the evil-eye (*sukut*, N.), which is similar to that worn by Nandi children. It consists of a necklace of seeds of the lepuyuwet tree (N. *lupuonik*) strung on a cord, the seeds being separated by short pieces of bamboo (Text-fig. 20). Old men wear a charm to keep away rheumatism (*kimakunyet*, or *kuroiito* (*kuroitu*), N.); it is made of two small pieces of the rĕrendet tree,[2] about 1 in. long, which are tied to the belt (Text-fig. 19).

V.—Social Institutions.

Social Divisions.

The male sex is divided into boys (*ilgetik*, N.), warriors (*murenik*, N.), and old men (*poiiniek*, or *apoiiniek*, N.); the female sex, into girls (*ilpik*, N) and women (*korusiek*, or *chepionik*, N.). At circumcision, a boy becomes a warrior and a girl a woman.

Married and unmarried people sleep separately. Maried people and small children may sleep in the same hut, while unmarried men sleep elsewhere, often in the sigiroinet (N.), or "warriors' hut," where they cohabit with the unmarried girls. Though free-love is practised, it is not carried to such an extent as among the Nandi, and although girls sleep with warriors, they like to preserve their virginity till circumcision. Warriors frequently marry their sweethearts (*nureriat*; N. *nureret*), whereas in Nandi they usually marry someone else.

The position of women is the same as it is among the Nandi, that is, they wait on the men, do all the menial work, and are their husband's property.

[1] This word is not used with the same sense in Nandi; originally it seems to have meant simply "medicine-man" (Swahili, *mganga*).

843 pendants, beads, chains, or even a head of small livestock.

During the last two months before her confinement the woman is given only a meager diet, so that the birth will be easier. Here, too, as among the Masai, the pregnant woman wears no ornaments. On the day of the confinement the husband may not leave the camp. His mother or mother-in-law acts as midwife. Besides the obstetric methods of the Masai, there also exists here the custom that the husband, to increase the labor-pain activity, perhaps moistens with his saliva the chest, abdomen, and back of the woman giving birth and then massages them gently with circular movements. While doing so, he several times calls out the words "Mighty God, let the child come out!" The umbilical cord (en entua) is severed with a razor-knife (hevera) and then, together with the placenta, buried in the hut. It is not the object of superstitious customs. It is regarded as unlucky if the child's upper incisors come through before the lower ones; it is believed that this will cause illness or death in the family. The young mother may not leave the hut until five days after her confinement, out of consideration for her health, not for superstitious reasons. The suckling period lasts one and a half to two years. Besides mother's milk, the little one is stuffed with a great deal of the fat of game, of which that of the large pachyderms is particularly valued as infant food.

Deformed newborn children are killed by strangulation by the midwife immediately after birth. The highest figure known to me /243/ of confinements of one woman was 11. From 71 aged Asa women questioned, 154 children were born, which gives an average of 5.7 per woman. Of these, 81, therefore 52.6 per cent, were girls, and 73, therefore 47.4 per cent, were boys. Before their circumcision 70 = 45.5 per cent had died, in which the stillbirths are included. Until their circumcision the children live in the hut of the mother.

/351 cont./

IX.

000 Clothing and adornment. -- Cloth materials. -- The individual articles of clothing and adornment, compared with those of the Masai. -- Head and body hair. -- Nails. -- Painting. -- Tattooing.

439 Cloth materials, such as are the tender of the caravan people in
648 the barter trade, have been adopted only to an extremely slight extent
199 among the Asá. The principal reason for this is that they only rarely come into direct contact with the caravans; rather, under pressure from the Masai, /352/ they are forced to deliver to them their yield in elephant tusks, hippopotamus teeth, and horns of Rhinoceros bicornis for a small compensation. There is no question of a legal barter trade: the Masai buy kwa nguvu = with force, as the coastal peoples so aptly designate this type of trade.

291 One therefore sees the Asá almost solely in their original leather
191 clothing (hide worked into leather, magadeg, magadaig), which, in cut and manner of wear, is identical with that of the Masai, but looks
[511] poorer and often ragged. This poverty is particularly noticeable for the boys' and mens' capes, called e meggi and en jorika by the Masai, which the Wandorobo name the same, and which here are also worn by older men because in hunting the oi gela is too inconvient because of its length. The dobonog otherwise do not generally wear the e
[561] meggi, rather more often an en jorika made of calf hides, which they
[237] buy from the Masai; older men often have it made out of the hide of
[439] the female black-headed antelope. The costume of the women is here called gak (pl. tak), as is the upper part of it (oi eghekobo of the Masai) by itself, while the lower one is named after the Masai designation of ngomana gumóna (pl. gomonót). The oi gela i oi moruak is here called gak o dalma and is considerably shorter than the former, only a little longer than the en jorika. Sandals (ikirika) serve them as footwear, which, however, in general are not used. In adornment
• 301 the poverty of the Asá is shown particularly among the dobonog, though
561 one must also consider that their desire for favor in the eyes of the
832 fair sex is, as a result of circumstances, very considerably less than

/252 cont./

301 [561] [832] that which fills the ol méran. Whereas the latter vie with one another for the favor of so many girls, the former, in their small camps, scarcely have to fear any competition. Lavish and conspicuous ornamentation, however, would also be burdensome and hindering for the hunter in hunting. Hence for the most part one finds among them, as well as [171] among the married men, only in the ear lobes the tube-shaped ol gisoi of the Masai, which designate the same, and around the neck a smaller number of simpler rings. On the other hand, the Wandorobo women, concerning the quantity and types of ornaments, are quite on a par with those of the Masai. To be sure, one never finds among the former such, decked-out fashionable beauties as among the latter; rather, the individual woman has only a few articles of adornment. Besides the ones mentioned, the author also found the following kinds of ornaments, which, for the sake of brevity, are to be listed only with the names of the Masai and Wandorobo. (From the first designation 301 192 then is to be seen, according to Section II, what it concerns): ol orowñ, here lilúod; ol eleschua, here called the same; ol gimeta, here likewise; e rab, here ehguan; ol kibaha, here likewise; en ñil, here called the same; ol benik, here likewise; olaiai, here na haiik; further, the heavy brass-wire ear pendants of the women (surudia), here tamaschik, tamagik, and the large ornament of iron wire es segenget e murt, here es segenget endet to inat; es segenget ol baraŋgasch, /253/ here es segenget to lubang; es segenget en dagwik, here es segenget to n dagwigt, and the es segenget ol oreschet, here es segenget to el.

301 Finger rings (here ol gimei ku seigetok) are worn only by women, and, to be sure, especially on the middle finger of the right hand. Men do not wear any, because allegedly the bowstring easily catches on it in shooting.

302 Men, women, and children shave their heads as a rule and let the hair grow at most two inches long between two shavings. One seldom meets a dobonog with the braid coiffure (eimug).

[171] Head and body hair are removed to the same extent and in the same

1, A [For a description of these ornaments, see Masai FL12, 18:Merker, category 301--Analyst]

/373 cont./

M 824 394. ol oje baaki = ol olje baaki.

395. ol ojedgaléni (Sesbania aegyptiaca Poir.). The decoction of a piece of bark approximately ten inches square in size is given the cow to hasten the expulsion of the afterbirth, if this is protracted for an abnormally long time.

396. ol okiténi. The decoction of an approximately fist-sized piece of bark is regarded as loosening for catarrh.

D [824] 397. ol omej. Masai sometimes, El dorobo often, stick a branch of this on either side of the hut door as protective magic against predatory animals.

D M [825] [784] 398. ol ómik. Valued by the El dorobo as a good honey plant.

399. ol olorua (Maesa lanceolata Forsk.). A nerve-stimulating agent of the warriors. They drink the decoction of approximately seven finger-sized pieces of the pungent-tasting root at the ol bul meals, as desired.

400. ol olorobi. The berries are edible.

401. ol ólól (Andropogon Schoenanthus). The livestock do not like the grass, because of its lemon smell. In places the grass is used to make a diaphoretic tea that is given for fever.

402. ol olubói = ol gitende (Haemanthus nov. spec.).

403. ol órók olele (Justicia matamensis). Good fodder for small livestock.

M [825] 404. ol ólóóló (Cissus Paraguensis Gilg). Warriors en route and especially during the forest meals like to put the vines into the bed padding, because they are said to keep away insects.

M 824 301 405. ol orowil kete (Justicia calcarata Hochst.). Fragrant neckbands are twisted out of the bark-bast, smelling like vanilla.

406. ol orowil kitok (Justicia Fischeri Lindm.). Use like that of the preceding.

407. ol orowil l ol aijok (Ageratum conyzoides L.). Use like that of the preceding.

D 824 301 408. ol orowil l ol dorobo (Neuracanthus sacani Kl.). The El dorobo make fragrant neckbands out of the scraped bark.

409. eig osida kitok. Good fodder for goats.

M 824 410. eig osida gutok (Barleria ventricosa Nees.). El dorobo make arrow shafts from the branches.

D 824

1: Huntingford E-4, 5 (1938-1939) 1953 FLÁ Dorobo FLÁ

A striking difference between the Dorobo and Nandi systems is that whereas Nandi may not marry any person in the *ilíet*, the Dorobo were insistent that a man might marry his father's sister's daughter's daughter, the girl whom he calls *macokor*, a person definitely in the *ilíet*. This type of marriage does not seem to occur now; but did in the past. Marriage with a wife's sister is considered objectionable.

Behaviour patterns may be summed up in a statement made by a Dorobo that "a man does not use bad language to his father, though his father may beat him as a child, nor does he use bad language to his father's brother; he does not speak of dirty things, nor of sexual matters, to his mother and his mother's sister, for it is bad to do so; but we are all on terms of friendliness and 'clean fun.'" Generally speaking, seniority is a matter of age, except with respect to the father's brother. Between a man and members of his own generation considerable latitude is allowed; but elders must always be shown respect. Where the claims of relatives are concerned, the amount of contact is important, for even a close relative who lives a long way off and is seldom seen cannot expect and will not receive so much respect as one who lives nearby and is well known. On a husband's part, there should be complete avoidance of his wife's mother, though this may be relaxed by degrees as he gets older; conversation with the wife's father should be limited to greetings.

Pre-marital Sex-life

Owing to the small number of Dorobo and the consequent shortage of women for wives, men have little in the way of pre-marital sex-life; and if a man does manage to acquire a lover, he often marries her.

Bridewealth

This varies according to circumstances, and Dorobo statements about it are conflicting. In 1927 it was said to consist of large quantities of honey-wine and of monkey-skin caps; but in 1930 the standard was one cow (with calf if still suckling), one ox, and four goats. The number of goats varied in the recorded cases from two to six, and in one case the cattle amounted to four oxen. A man also gives his father-in-law presents of honey-wine and a fur cap or two; thus marriage is more of a drain on a man's resources than formerly.

Betrothal

A man chooses his wife himself, and arranges the preliminaries with the girl's father during two visits at which he gives him presents of honey. After the second visit the father calls the clan council together and publicly gives his consent to the marriage.

Marriage

The marriage ceremonies are conducted by an elder known for the time as *patum*, who brings the bride to her future husband's home, where the guests are already assembled feasting. The girl enters the hut in which the ceremony is to take place, and in the presence of witnesses the *patum* gives her to the man, saying, *Koipuncia cicoto*, "you now belong to this man." He then binds some *sebutiet* grass on the man's right wrist, and an old woman binds some of the same on the girl's right wrist. They are now married. The *patum* then sets up an erection of *sebutiet* grass called *tumdo* which is smeared over with cow-dung; this the wife has to knock down and tread upon. After this, the pair are left alone, and the marriage is consummated. Next day the *tumdo* is trodden into the floor and plastered over with cow-dung, for it must not be seen. The pair are then shaved, he by the *patum*, she by the old woman, and the hair is buried in cow-dung under an erection of sticks called *hoveniot*, which is set up in great secrecy by the *patum*. It is essential

1: Huntingford E-4, 5 (1938-1939) 1953 FLÁ Dorobo FLÁ

cide, adultery, and assault. In the first category, incest is punished under the authority of the clan council: the man is beaten, his hut burnt, his honey-barrels destroyed; the woman also is beaten. Witches might be killed under authority of the *koret* council. In cases of persistent disobedience to the council, the elders could call upon two or three men to force the offender, by moral and physical persuasion, to mend his ways. Of offences in the second category, trespass has already been mentioned (p. 58). Theft, when not dealt with summarily, can be brought to the *koret* council, which can order payment of compensation. A man accused of stealing food may say, "If I am a thief, may this grass eat me," and place a blade of grass between his teeth. Adultery might be punished by the injured husband, who, if he killed the offender, had to pay blood-cattle. If a man incapacitates another by assaulting him, he must feed him till he recovers. Homicide of a Dorobo of another clan, though not involving primary sanctions, was a serious offence because it meant that the murderer had to get cattle in order to pay compensation. The usual number was nine head of cattle, though when the murderer was a very poor man living alone the number might be reduced. The kind of cattle (male or female) did not matter. The murderer had to provide as many as he could, from his own herd if he had one, or by exchange from the Nandi, or by any other means, including theft. The deficiency had to be made up by his fellow-clansmen.

Summary

The Dorobo horde consists of a loosely integrated group of districts held together partly by the feeling that they are all Dorobo, but much more by the clan ties which cut across the district boundaries. The clan is therefore one of the chief institutions in the life of the Dorobo.

MAIN CULTURAL FEATURES

Crafts

Housing

(*a*) Forest type: the *koconget*, in use as late as 1927, was a framework of sticks bent over to form an oblong, dome-shaped structure, covered on the outside with banana leaves and leaves of trees; height, 6 ft.; length, 11 ft.; width, 7 ft. (*b*) New types: the *keriet* has a circular wall about 5 ft. high plastered with mud, and an almost flat thatched roof supported by a centre post; the *kot* is a hut of ordinary Nandi type, the walls of which are occasionally left unplastered.

Settlements in the forest, consisting of three or four *koconget* huts, were situated in clearings just big enough to hold the huts, and were approached by concealed paths which branched in a bewildering manner that made it impossible to find them without a guide. Settlements outside the forest are arranged in small groups usually close to the cultivated land.

Dress and Ornaments

Clothing is made largely from the skins of wild animals, and the forms are mainly copied from those of the Nandi, as are most of the ornaments, which include, among other things, iron wire armlets and leglets, necklaces, and married women's ear-rings (*taok*). The ear-lobes are pierced and elongated (sometimes getting torn in the forest), and a small hole is bored in the top of the ear. Some but not all remove the two lower middle incisors. Hair is allowed to grow to a length of about 2 ins., when it is sometimes covered with a bladder cap, and sometimes dressed with red earth and fat. Occasionally a man has his hair done in pigtails like the Nandi.

Tools and Weapons

Axes and knives are obtained from Nandi smiths, the Dorobo making the wooden handles. Needles are made from old nails and bits of wire which the Dorobo

1:Huntingford E-4, 5 (1938-1939) 1953 FL6 Dorobo FL6

412 find lying about on the farms. The only weapon is the bow, *kuyagda*, which the
411 Dorobo make themselves from the *kuriot* tree (*lovlea* sp.); it is about 5 ft. long, and
[439] the bowstring, *inet*, is made from gut of the giant pig, *tumda*. Arrow-shafts are
278 made from the *koromandet* and *masaita* trees, or from bamboo, *sosoiyat*; arrow-
heads are bought from the Nandi, and are of the Nandi patterns. Arrows are carried
in quivers made of hide. Arrow poison is made from the *keliot* bush (*acocanthera Schimperi*).

Baskets

415 Making baskets, *kerepet*, is a common occupation of Dorobo women. They are
[462] made from fibre of the *phœnix reclinata* palm, *sosiot*, and sewn with bast made from
[824] a plant called *tapaririet*. The technique is a spiral foundation with a flat then
285 gradually ascending coil, of the simple over-sewn type and bee-skep variety, the
stitches being spaced out and not close together.

Miscellaneous

317 Salt used to be made from the ashes of the plant *tepenguet* (*æmilia integrifolia*).
[263] Red and white earth is found near Timboroa on the east of the Dorobo country, and
[439] men go in parties of four or five to dig it, carrying home the earth in large leather
[302] bags, mainly in order to sell it to the Nandi who, in 1939, gave them 2s. a bag.
415 Red earth, *erokoit*, is mixed with fat or simsim oil for rubbing on the hair; white
481 earth, *eworiot*, has magico-religious uses. For carrying a number of small objects a
carrying-net called *lekuelet* is used; it is made of a pair of oval rims 3 ft. 6 ins. long
with pieces of liana stretched across them, somewhat resembling a pair of handleless
tennis rackets. These are sometimes used by the Nandi.

Ritual and Beliefs

Religion

776 *Asista*, the sun, is recognized as a being that can supply or withhold the needs of people: *Asis, ipiiyec panyek*, "*Asis*, fill us with meat," is a common prayer. Some say that *Arana* the moon is his sister, others that she is his mother. Besides *Asis*, it is believed that there is a being called *Ilet*, the thunder, who produces rain, and "the rainbow is his arm which draws up water for him." The Dorobo also believe in spirits, good and bad, both of which are called *cesowiloi*, a word which includes the *oiik* (ancestral spirits) and *musambuanik* (evil spirits) of the Nandi. The
775 ancestral spirits have the same significance and functions as those of the Nandi, and though they punish the living for doing evil, they are otherwise friendly and visit the living, travelling in the bodies of snakes, both to see their people and to get food in the form of *lokomek* (honey and water); spirit-snakes should not be killed.

Divination

780 The Dorobo appear to have no diviners of their own, and when they have
648 recourse to divination, as in cases of illness or witchcraft, they go to Nandi diviners
759 of the type called *sakeynot*, by whom they are charged a small fee. The people
called *orkoiyot* (pl. *orkoiik*) among the Dorobo are no more than leeches or physicians
789 who prepare healing medicines from trees and plants. Although the Dorobo have a reputation among other tribes as powerful rain-makers, they themselves say that they have no rain-makers, which is probably true.

Death and Burial

764 Very old men and women are buried in narrow holes about 5 ft. deep in which the bodies are laid full length wearing their clothes; one year after an old man's death his children plant a branch of *mukupcot* (*dracæna* sp.) on his grave and let it grow. Other people are laid out for the hyenas, both sexes on the right side with

2: Maguire G-5 (ca. 1926) 1927-28
FL6 Dorobo FL6

be that their absence is in many cases due to poverty. The *Mósiro* women follow the unusual custom of the Masai women in shaving their heads.

The younger generation of the men ape the Masai in wearing pigtails and dress like them when they can. They are addicted to the use of *Ol-kária* [1] and will, in time, be absorbed by the Masai. A few of them are now working as herds for various Masai, and, as I have said before, others have begun to follow a pastoral life with their own small herds.

All the *Mósiro* speak Masai, but many of them do so very imperfectly. No Masai that I have met can speak the *Mósiro* tongue, though Masai who have come in contact with the Nandi tell me that the language spoken by the *Mósiro* to-day seems vaguely reminiscent of the Nandi speech. Reference to the lists of numbers given elsewhere will show the marked similarity there is between the numerals (up to five) in the Nandi, Suk and *Mósiro* tongues.

The language of the *Mósiro* is dying, as any language except Masai tends to do in the Masai country. I have asked many *Mósiro* to give me the names of various common objects, and I have often been given a Masai name, my informant protesting that he knew no other. In the case of the numerals, it would seem to be a moot point as to whether the *Mósiro* tongue originally possessed numerals up to seven only and borrowed the remainder from Masai, when usage demanded, or whether the numerals from eight onwards have fallen into disuse and have been replaced gradually by the Masai words.

The physical make-up of the *Mósiro* is good. They are, as a rule, tall and lithe and are in many cases more muscular than the Masai. The pigmentation of their skins varies from a light, clear brown to a black almost Nubian. There would seem to be differences between them and the Masai in the formation of the jaw-bone and the zygomatic arch. I have had neither instruments nor training to enable me to undertake a series of anthropometrical measurements, but I think it is safe to say that many *Mósiro* have high cheek-bones and

[1] A mixture of red ochre and mutton fat, smeared all over the body and patterned on the legs, arms and face. It seems to be in use among nearly all Nilotic tribes.

2: Maguire G-5 (ca. 1926) 1927-28
FL6 Dorobo FL6

enormously developed maxillary muscles. Individual physical peculiarities are not readily apparent when pigtails are almost universally grown and bodies are smeared with red ochre. The Nilotic peculiarity of standing on one leg has been observed in the *Mósiro*, but it is not seen so often as in the case of the Masai. I have been unable to discover any examples of pronounced steatopygia in the women, who are, usually, more prolific than the Masai women, and who are prized by the Masai for this reason. The *Mósiro* are a hardy race, and even at a comparatively advanced age the men retain great powers of activity and endurance.

The older generation (in common with the Masai elders) pays little attention to its personal appearance. *Mósiro* of a certain age would seem to be less under Masai influence than are the young men and are readily distinguishable from the Masai at first sight. (It might, perhaps, be as well to modify this by saying that an eye unaccustomed to looking on Masai will often fail to detect any difference between them and Dorobo of any type. Recently, I made the experiment of asking two Europeans from the coast to separate the Masai from the Dorobo in a mixed gathering. Each of them made a different selection and each of them was wrong in the majority of cases.)

In hunting, tracking, bush-lore and forest-craft the *Mósiroi* is, in my opinion, without equal when in familiar country. He seems to know instinctively what an animal will do under given circumstances, and inability to follow its track will seldom result in the pursuit being abandoned. If the ground is stony or if the passage of other animals has obliterated the trail, the *Mósiroi* will go quietly forward and will eventually, by a combination of luck, instinct and knowledge of the country and the habits of the quarry, pick up the spoor again. I have seen this happen many times. The *Mósiroi* knows when extreme caution must be observed and when noise does not matter; he is never at a loss for a vantage-point and, on the whole, is tenacious and plucky in the pursuit of dangerous game. He can summon lion to a kill by producing a weird, muffled, nasal cry (it is supposed to represent the bleating of a goat, though it has little resemblance to that noise, to my

3:Huntingford E-5 (1921-1928)1929 FL6 Dorobo FL6

291
301 large discs of brass wire (*tuet*, pl. *tudk*), which are hung from the ears by leather straps (*muilto*; N. *muito*), to which are frequently fastened one or two cowries (*sekeriek*; N. *sekerek*) (Text-fig. 18). These ear-rings are, as among the Nandi, the sign of marriage. Girls wear skins (*akuriet*) or cloth (*anget*). They have armlets (*kurik*, N.) and leglets (*ndapalweet*; N. *tapalweet*) of iron-wire, and necklaces of wire or beads (*asingait*). The edges of skin garments, both of men and women, are generally trimmed and stitched.

Mutilations of the Body.

304 (a) *Ears.*—In both sexes a small hole (*engeberit*; Kony *ingeberit*) is bored in the top of the ear. This among the Nandi is the tribal mark, and it seems to be so among the Dorōbo. Both sexes also pierce the lobes of the ears, and elongate them by inserting cylindrical blocks of wood (*ketik ap iitik*, N.), as among the Nandi.
[301] Ear-rings are hung from the lobes, which in the case of men are often broken by being caught by branches in the forest.

(b) *Teeth.*—Some Dorōbo remove the two middle incisors of the lower jaw, like the Nandi and other tribes; others do not. This is done, they say, "*si ko-kororon-it piik*" (in order that people may become beautiful).

(c) *Sexual Organs.*—Circumcision and clitoridectomy are practised. (*See* V, "Circumcision.")

Hair.

302 Men wear their hair moderately long; they put oil and red clay (*ngaret*, N.) on the hair, which sometimes becomes matted, as seen often on Nandi, particularly women. The head is shaved periodically. Boys put red clay and oil on to the shaved head. Both old men and senior warriors wear beards and moustaches, though to no greater extent than the Nandi. In some old men the beard is seen trimmed and pointed. Girls and women shave their heads periodically, and put oil on the shaved heads.

Paint.

Warriors paint their legs with red and white clay, as do the Nandi; they also put red clay on their heads.

Arts and Crafts.

325
[439] The Dorōbo have few crafts of their own. They have no knowledge of metallurgy, and there are no smiths; all their ironwork is obtained from the Nandi.

(*a*) Weapons of Chase and War.

411 These consist of bows (*kuyaāgda*), arrows (*kōtiek*, *kiperēnik*, *kipchāponik*, N.; and *mbunatit*); spears (*olmorondoit*† or *morondoit*†); swords (*weseito*; or *rotuet*, N.); shields (*loāget*, N.); and knives (*chambolust*, N.). Spears, swords, and shields are obtained from the Nandi.

4:Huntingford E-5 (1938-1939) 1951 FL6 Dorobo FL6

585 is dressed and oiled during the morning at her own home by the old women of her family and settlement. When she is ready the bridegroom's mother and the *Pa-tum* come for her, accompanied by a small boy or girl known as the *mistoat* or "herdsman", who acts as page or bridesmaid. It does not matter whether the *mistoat* is a boy or girl: the choice depends entirely upon who is available. The function of the *mistoat* is obscure; he or she merely walks with the bridal party, doing no specific duty. The bride is led to the bridegroom's place, where the guests are assembled drinking the beer and eating the food which has previously been prepared by the bridegroom's family. By now it is evening, and the bride on her arrival is called, together with the groom, by the *Pa-tum* to the hut where the ceremony is to take place. In this hut, in the presence of some old men, the *Pa-tum* says to the bride, *Keipuncin cicoto, meiwendi* ("you belong to this man, do not go from him"). The old men then leave, and when they are alone the *Pa-tum* binds a bracelet of *sekutiet* grass (Sporobolus) on the bridegroom's right wrist, while an old woman of the girl's clan binds a similar bracelet on the girl's right wrist. This act and the words '*keipuncin*', etc. constitute the essential part of the ceremony, for they bind the woman to her husband. After this, an erection of grass called *tumdo* is set up in the middle of the hut by the *Pa-tum*. It consists of a bundle of *sekutiet* grass tied together and set up in a hole in the floor, having been made in secrecy beforehand by the *Pa-tum* and the old woman who assists him. The *Pa-tum* makes a hole in the floor with a pointed stick and lines the hole with dung. The bundle of grass is then stood upright in it and the base is plastered over with a small mound of dung, and dung is also smeared all over it so that the grasses stick together; the dung must be cow-dung. When it is ready, the husband says to his wife, *Nyon tiec*, "come and tread on it". She does so, whereupon the *Pa-tum* sets it up again, and the action is then repeated three more times, after which it is left lying on the ground and remains there all night, while the newly married couple consummate the marriage beside it. The *tumdo* seems to be a fertility symbol, erectio phalli, and is perhaps left on the floor during the first marriage-act to ensure a fertile union. In the morning it is trodden well into floor and dung is plastered over so that it cannot be seen. It is particularly important that children should not see it. Next day the pair are shaved, he by the *Pa-tum*, she by the old woman, and the hair is buried under an erection called *korosiot*, which is made by the *Pa-tum* of five or six sticks about 5 feet long cut from *oltamiyoit* (olive), *ceptuiyet*, or *masaita* trees, and tied together at the bottom with liana and set upright in a hole in the ground somewhere in the forest or in thick bush. The hair is placed against the liana binding, and a small mound of cow-dung is made over it. The *korosiot* is then left untended till it falls down. No children or unmarried people may see it, and it is made with the utmost secrecy by the *Pa-tum*, none but he knowing where it has been set up, in order to prevent the hair from getting into the hands of a witch. The use of cow-dung is essential for both *tumdo* and *korosiot*, and if there are no cattle in the bridegroom's settlement, somebody must go beforehand and bring some in.

842

302

5:Huntingford E-5 (1938-1939) 1954 FL6 Dorobo FL6

682 few relatives it would be very much less. The murderer had to provide as
623 many of the number decided upon as he could, either from his own herd if
692 he had one, or by getting them from the Nandi in exchange for furs, which meant, of course, that the cattle would be either oxen or worn-out old cows, and that he would not be able to provide many himself. It therefore fell to his relatives and clansmen to make up the number, which needed a clan council to apportion the balance among them, and also resulted in a good deal of feeling against the murderer for a time. Until the amount had been
[614] agreed upon by both clan and *koret* councils, the murderer was liable (in theory at least) to be killed by his victim's relatives, so he had to lie low till the negotiations were completed, though again it is doubtful if they would actually have gone as far as killing him, for then they themselves would merely have had to return the cattle as compensation for their own act. In dividing cattle between the murdered man's relatives, the order of priority was brother, wife, father, mother, father's brother, father's brother's son, father's sister's son.

683 **Killing a witch.** Though in 1939 I could hear of no Dorobo who were
754 reputed to be witches (*ponik*), such people certainly existed in the past. Apart from killing people by spells, their principal activities seem to have been centred on hunting — putting spells on game traps and on men who were going to hunt. If a witch was shown by a diviner to be guilty of a person's death, he or she might be killed, and no compensation was payable (*mepase*).

609 **Killing an enemy.** This means killing any person who is not a Dorobo
682 and is believed or known to have performed any unfriendly act against the Dorobo. The Dorobo have no sort of war organization, and their enemies
[701] were generally shot at from the cover of under-growth. Though not a crime,
[721] killing an enemy none the less makes the killer ritually unclean and therefore
[783] dangerous to others because he has shed human blood. This action is thus brought into the same category as homicide of a Dorobo, and though there is naturally no compensation, purification is required. The face of a man
[802] who has killed an enemy is painted (*kemase tokei*) with stripes of white earth (*emoriot*) on the forehead, down each cheek, and down both sides of the nose. The paint is allowed to remain till it flakes off, and the man does not have to stay in his hut, but goes about as usual; though if he had killed a Nandi he would take care to go to some other part of the forest till he thought it safe to return. In actual fact, Nandi were seldom killed, but one who strayed into the forest might get shot by accident: the body would be taken to a lonely place for the hyaenas to eat, and at any sign of Nandi activity the Dorobo would vanish into the depth of the forest where the Nandi would have little chance of finding them even if they had the inclination to search.

685 **Theft.** Stealing honey is the worst kind of theft, and is almost comparable with intra-tribal cattle-theft among the Nandi. A man who steals honey from someone else's barrels is considered very low indeed, and if found

5:Huntingford E-5 (1938-1939) 1954 FL6 Dorobo FL6

a clear, windless sky. About 10 o'clock a curious whistling noise began to come from a certain part of the forest, and continued, on the same note, and without a break, for several hours. It was certainly no human or machine-made noise, and the Dorobo professed complete ignorance of it. A Nandi who had lived there before the Nandi War told me afterwards that it was an evil spirit whistling in the forest, "for we used to hear them whistling to each other like that in the forest when I was a child".

Between people and the things on which they depend for their existence both spiritual and material there is a connexion which is best expressed in terms of a ritual relationship. Things have a ritual value for people, and people themselves have a ritual status which is a relationship with their surroundings that can be altered for better or for worse according to the way in which they respect the ritual value of the things around them. Religion and magic form the procedure which protects these ritual values and status, while political organization is, in a sense, no more than an effort to maintain the ritual status of the horde in spite of the tendency of its members to injure their own ritual status and in consequence that of the horde also.

Certain things that a person does, whether voluntarily or involuntarily, cause deterioration of ritual status; but the original status may be recovered by the performance of certain ritual actions which may involve some personal effort or sacrifice. Examples of acts which cause loss of ritual status, and the means taken to restore it, are: (1) A girl who bears a child before marriage must have the undigested grass (*eiyat*) from the stomach of a goat rubbed over her face, neck, and breasts, and must then wash it off. (2) After a woman has given birth, she is in a condition of much reduced ritual status, and her husband must rub goat's fat and *eiyat* over her face, breasts, and belly. (3) A man who has killed a Dorobo must have goat's fat rubbed all over him. (4) One who has killed an enemy must have stripes of white earth painted on his face. In all these cases the people have done something which causes loss of ritual status, making them ritually unclean (*uuan* or *somis*) and so a source of danger to others till they have been purified. The potential danger is removed by means of something which has a ritual value. Moreover, an essential element in the cleansing process is sacrifice, that is, the use of the material must either involve giving up something which is valued, or it must require some effort or even risk to get hold of. The *eiyat* or fat must be from a domestic animal: if the person concerned has one, he must use it; if he has none, then he must get one, and without delay, which for a Dorobo usually meant that he had to steal it, and thus risk getting killed while doing so. Therefore there is an act of faith in these magico-religious performances, and people believe so firmly in the efficacy of what they do that they are prepared to risk danger in order to get the necessary materials. The use of white earth may entail no more than a journey to get it, but that still means a personal effort on somebody's part. Materials which are used for the restoration of ritual status, and in consequence have a special ritual value, include: the flesh of goats, which is eaten when twins are born, and in cases of incest; *eiyat*, the undigested grass from the stomach of a ruminant (a sheep

6:Huntingford E-5 (1938-1939) 1953 FL6 Dorobo FL6

241
[361]

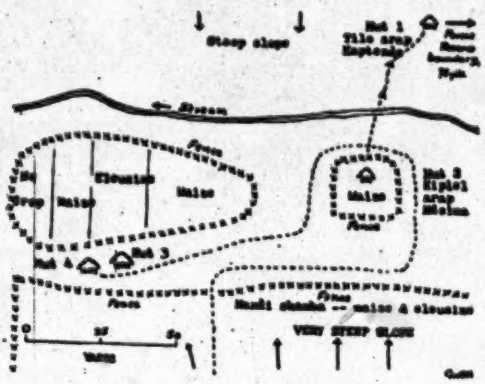

Fig. 6. Plan of a Dorobo Shamba at Kelpui alongside a Nandi Shamba.

at Kipukua in 1938 the crop was so much damaged by monkeys, pigs, and a sort of mole called *keseviat*, that the original shamba had to be given up, and the occupiers took up new and separate plots elsewhere. Sometimes a Dorobo has a shamba all to himself; more often, however, several people divide the area inside a fence, each contributing to the labour of making it; [648] and in some cases Dorobo share part of a fenced shamba with Nandi (Fig. 6).

317 Though not connected with cultivation, we may mention here the subject of earth digging, because it is concerned with the ground. Red and white earth is found near Timboroa (or *Tambarua*, as the Dorobo call it), and men go in parties of four or five to dig it. They use nothing but a digging [482] stick, *kamet*, made of a sharpened stake, and the earth is carried home in large leather bags. In former days, when other Dorobo lived in the earth- [423] producing area, a digging party would ask leave to dig from the man who hunted over that tract of land, and though no fee seems to have been paid, it is said that if a man should refuse his consent, the party would go home without digging. But as no Dorobo now live there, this could not be 439 verified. To-day the Dorobo sell coloured earth to the Nandi, who pay them 435 at the rate of 2 shillings for a large bag of earth. Red earth, *erokoit*, is used 302 mixed with fat (or sometimes *simsim* oil) for rubbing on the head; white 789 earth, *euoriot*, is used as a magical remedy in cases of homicide.

d) Cattle

231 If the Dorobo had not been in such close contact with a people whose 177 primary interest in life was cattle, it is possible that they would have contented 181 themselves with agriculture and no live stock. But their relations with the Nandi have inevitably led them to take an interest in cattle, and to think that the [556] possession of cattle is a desirable thing. Therefore they are slowly trying to acquire cattle, and are in process of making them their ultimate objective. But

000 Pregnancy. -- Behavior of the pregnant woman and her husband. -- Care and treatment of the pregnant woman, the woman in labor, and the woman in childbed. -- Killing newborn children. -- Fertility. -- Child mortality.

843 [842] [824] The opinion that the author heard expressed a number of times by Asá-Wandorobo, that pregnancy is more or less bound up with a definite time of year, and, to be sure, in such a way that either conception takes place at blossom time or birth takes place at the time of the fruitage of the poisonous tree Acocanthera abyssinica, appears surprising.

[224] /242/ During his wife's pregnancy the husband does not pursue a game animal shot at in hunting, because it is believed that the latter, at his approach, will resist the poison and escape. Therefore, after he has shot an animal, he returns to the camp and from there sends another man out to look for the animal. The pregnant woman [825] may not be beaten. Neither he nor the pregnant wife may step over a procession of migrating ants. She is forbidden to eat meat from a wild animal that died or was killed by a predatory animal, likewise soup, and furthermore honey in which dead bee larvae are found. She must avoid coming near a chameleon or a snake, or exposing herself to the heat of the sun for any length of time. All this, in the opinion of the Asá, would harm the fetus.

[302] [202] If the woman visits another camp, she smears her forehead with white clay beforehand in order to announce her condition to its occupants. On the way there she is accompanied by a little girl, [858] whom she leads by the hand. As the reason for this, the people [825] say that a miscarriage would take place if the woman went without a girl and on the way saw the previously mentioned weaver bird or heard its dil-dil-dil calls. A woman pregnant for the first time is 843 given gifts by all the people (men, women, boys, girls) of the camp 431 and her friends in the neighboring camps at about the middle of her pregnancy. She is presented with a leather apron, a pair of ear pendants, beads, chains, or even a head of small livestock.

/252 cont./

301 [56] [832] that which fills the el móran. Whereas the latter vie with one another for the favor of so many girls, the former, in their small camps, scarcely have to fear any competition. Lavish and conspicuous ornamentation, however, would also be burdensome and hindering for the hunter in hunting. Hence for the most part one finds among them, as well as among the married men, only in the ear lobes the tube-shaped ol gissoi of the Masai, which designate the same, and around the neck a smaller number of simpler rings. On the other hand, the Wandorobo women, concerning the quantity and types of ornaments, are quite on a par with those of the Masai. To be sure, one never finds among the former such, decked-out fashionable beauties as among the latter; rather, the individual woman has only a few articles of adornment Besides the ones mentioned, the author also found the following kinds of ornaments, which, for the sake of brevity, are to be listed only with the names of the Masai and Wandorobo. (From the first designation then is to be seen, according to Section II, what it concerns):

[171]

301 192 ol orowĭl, here lilŭod; ol eleschua, here called the same; eń gimeta, here likewise; e rab, here eńguan; ol kibaba, here likewise; en jili, here called the same; ol benĭĕt, here likewise; olaiai, here na haiiĕt; further, the heavy brass-wire ear pendants of the women (surudia), here tamaschiĕt, tamagĭg, and the large ornament of iron wire es segeńgeĭ e murt, here es segeńgeĭ endet to issat; es segeńgeĭ ol barańgasch. /253/ here es segeńgeĭ to lubaog; es segeńgeĭ en dagule, here es segeńgeĭ to n dagulet, and the es segeńgeĭ ol oreschet, here es segeńgeĭ to eĕ.

301 Finger rings (here ol gissoi ku seńgetok) are worn only by women, and, to be sure, especially on the middle finger of the right hand. Men do not wear any, because allegedly the bowstring easily catches on it in shooting.

• 302 Men, women, and children shave their heads as a rule and let the hair grow at most two inches long between two shavings. One seldom meets a dobonog with the braid coiffure (sémug).

[171] Head and body hair are removed to the same extent and in the same

1, [For a description of these ornaments, see Masai FL12, 18:Merker, category 301--Analyst]

/253 cont./

302 [171] [412] [304] [154] manner as among the Masai, but here the eyebrows are also shaved by both sexes. The nails are cut with an ordinary two-edged knife. The two middle lower incisors are not broken out for everyone. Hair and nail cuttings are thrown away or hidden at some distance from the kraal, so that they will not fall into the hands of an evil sorcerer, who would be able to make from them sorcery leading to a sickness for their former wearer.

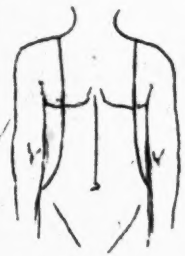

Fig 87.

302 531 [386] The young men and girls color their entire bodies with a paint made out of fat and red earth (ol garia), or the former also only legs and lower arms, and then wipe off the color again in serpentine lines (lama) that run parallel an inch apart. After killing an elephant [171] the happy hunter paints his chest with three lines, the two outer ones of which go from the collarbone over the nipples to the hips, the middle one from the chest to the navel (Fig. 87), or they paint

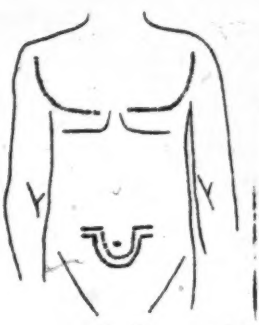

Fig. 88.

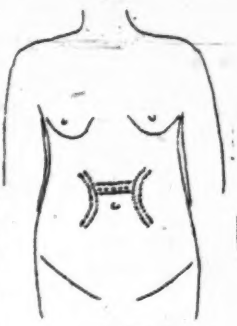

Fig. 89a.

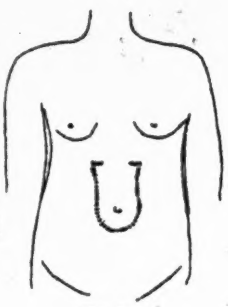

Fig. 89b.

their whole bodies, with the exception of the abdomen, with white and red stripes (like the Masai warriors). The former painting they [192] call katadiridi, the latter they designate with the Masai word en gituñguat. At feasts the men draw a line with the powder ol mogoñgora = root, from the upper lip upward over nose and forehead to the hairline. Boys (Fig. 88) and girls (Fig. 89) tattoo the lyre 304 figure /254/ of the Masai, the latter also another similar one on the 171 abdomen. Not infrequently one also finds on the face of the women [531] the etched-in ol kigerot design, which has been discussed for the Masai.

1:Huntingford E-4, 5 (1938-1939) 1953 FL6 Dorobo FL6

SOCIAL ORGANIZATION AND POLITICAL STRUCTURE

Social Organization

561 *Life Cycle*

Dorobo men pass through three stages: *getik*, uncircumcised boys; *murenik*, circumcised men; and *apaiisiek*, elders. Boys are circumcised between the ages of 15 and 18 years, and may marry at any time after circumcision when their circumstances allow. Some men in fact never marry at all, but live alone, getting occasional help from women in the settlement, and depending for sexual satisfaction on surreptitious affairs with wives of age-mates. Women are first *tipik*, girls; then *yoseik*, married women; and finally, when they begin to look old, *engitokisiek*, old women. Girls marry soon after they have been circumcised.

[304] [587] [887] [589]

Kinship and Behaviour

602 [171] The existing Dorobo relationship system, *tiliet*, is structurally similar to that of the Nandi, and uses a number of Nandi terms; but it is less regular and includes in the *tiliet* a larger number of persons than does the Nandi. Moreover, the collective term *macokor* (which I did not find in use as a true relationship term in Nandi) is used by the Dorobo as the proper term for a number of people terminologically differentiated by the Nandi.

601 Within the *tiliet* the chief terms are: In the third ascending generation, all males are *macokor* and all females *makikat;* in the second ascending generation, all males are *kuko* or *akui* and all females *koko*.

In the first ascending generation, the terms are: *papa* = father, father's brothers, and mother's sister's husband; *eiyo* = mother, mother's sisters, and father's brother's wife; *pukot* = father's sister; *konyit* = father's sister's husband; *mama* = mother's brother and his wife. Terms used by women are *sindet* = father's sister and father's brother's wife; *apulaiyo* = mother's brother; *eiyo* = mother's brother's wife; and *konyit* = mother's sister's husband.

In a man's own generation, his brothers, sisters, and mother's sister's son and daughter are *kesenda;* mother's brother's son and daughter, *mama;* and the son and daughter of his father's brother and father's sister are *macokor*. Women's terms which differ from these are: *apulaiyo* = mother's brother's son and daughter; *eiyo* = mother's sister's son and daughter.

In the first descending generation, *apaa* includes son, daughter, brother's son and daughter; *mama*, sister's son and daughter, and mother's brother's son and daughter; *macokor*, father's brother's children's children, and father's sister's children's children. In the second descending generation, both sexes are *akui*, except mother's brother's children's children's children, which are *mama;* and mother's sister's children's children's children, *kesenda*.

Among affines, wife's father is *pamoyo;* wife's mother, *poker;* wife's brother, *konyit* and his wife, *poker;* wife's sister *pukot* and her husband, *kipukotiet;* wife's brother's son and wife's sister's son, *apaa;* wife's brother's daughter and wife's sister's daughter, *pakuo*. Husband's father is *pakuo* and his mother, *poker;* husband's brother *konyit* and his wife, *sindet;* husband's sister, *kamati* and her husband, *poker;* husband's brother's children, *lakuet;* and husband's sister's children, *apulaiyo*.

602 604 In the *tiliet* it is the *father's brother* who stands out and occupies the special place in family life that the mother's brother does among the Nandi; not a few Dorobo did not know their mother's brother's name. Owing to the nature of Dorobo life, the father's brother is continually in contact with his brother's children, and his relations with his nephews are even closer than those of the Nandi *mama* with his nephews.

1: Huntingford E-4, 5 (1938-1939) 1953 FLA Dorobo FLA

patronymic from their father's porridge name. Younger sons generally take their patronymic from the father's nickname, or else from some circumstance in their own lives.

Circumcision

Boys are circumcised at the same intervals as the Nandi, and the Dorobo keep watch for the opening of the Nandi circumcision. Occasionally boys are circumcised in Nandi with other Nandi boys, but more often in the forest, as in the circumcision of 1928–30. Sometimes a Dorobo acts as operator for the Nandi. The whole procedure of circumcision (*tum*) is identical with that of the Nandi. Girls undergo the operation of clitoridectomy whenever there are enough ready to be done, and not at any stated intervals.

Age-sets

The Dorobo have borrowed the whole age-set system from the Nandi, and it works exactly as among the Nandi, with the same set-names and 15-year intervals synchronized with those of the Nandi. The reader may therefore be referred to the account of the Nandi system, p. 31. A slight difference in the sub-divisions called *mat* may be noted: the Dorobo have only three, called *Cogimich*, the senior; *Taparik*[1] or *Kipalkonyeh*, the middle; and *Ruwahanik* or *Kiptoimik*, the junior. A more significant difference is that the sets have no military or political force, for the Dorobo are not fighters, and the practical effect of the system is to introduce further behaviour patterns, as well as to modify the traditional rules of hospitality; for while no Dorobo would refuse to shelter one of his own horde, the degree of hospitality varies according to the age-set situation.

Political Structure

Land Divisions

The Dorobo live mainly in clan settlements divided between a number of districts or parishes (*korosuek*, sing. *koret*). Till about 1930 these settlements were in small clearings inside the forest; after 1937 they were spread round the outer edge of the forest.

The Clan

The clan, *oret*, is an exogamous patrilineal group with a name and a totem, *tiond ap oret*, the animal of the clan. The existence of eight clans is attested by genealogies and the census; three others are reputed to exist or to have existed, though none occurred in my records; they were, however, mentioned to me in 1927 as well as in 1938–9. Each of these clans has one totem, except Moi which has three, one of which it shares with another clan; it is not the totem which is important, but the group itself, the clan being a social group, not a group of people mystically related through their totem. The emphasis is therefore on the clan name and not on the animal, though marriage, nevertheless, is forbidden within the clan. An exception to this rule is found in the case of Moi, where intermarriage is allowed between people of different totems, an anomalous feature due possibly to the influence of the Nandi, among whom Moi marriages are common between people of different totems. (See p. 27.) There seem to be no restrictions either on marriage between clans (as among the Nandi), or on killing or eating the clan animal, which suggests that originally the Dorobo clans were non-totemic, and that their present totemism is a feature borrowed from the Nandi along with the clan names, which except for one of the reputed clans are all Nandi.

[1] The Nandi occasionally use *taparik* for this *mat*; it is a Nandi word meaning "the turves."

Is Huntingford E-4, 5 (1938-1939) 1951 FLA Dorobo FLA

side, adultery, and assault. In the first category, incest is punished under the authority of the clan council: the man is beaten, his hut burnt, his honey-barrels destroyed; the woman also is beaten. Witches might be killed under authority of the forest council. In cases of persistent disobedience to the council, the elders could call upon two or three men to leave the offender, by moral and physical persuasion, to mend his ways. Of offences in the second category, trespass has already been mentioned (p. 86). Theft, when not dealt with summarily, can be brought to the forest council, which can order payment of compensation. A man accused of stealing food may say, "If I am a thief, may this grass cut me," and place a blade of grass between his teeth. Adultery might be punished by the injured husband, who, if he killed the offender, had to pay blood-cattle. If a man incapacitates another by assaulting him, he must feed him till he recovers. Homicide of a Dorobo of another clan, though not involving primary sanctions, was a serious offence because it meant that the murderer had to get cattle in order to pay compensation. The usual number was nine head of cattle, though when the murderer was a very poor man living above the number might be reduced. The kind of cattle (male or female) did not matter. The murderer had to provide as many as he could, from his own herd if he had one, or by exchange from the Nandi, or by any other means, including theft. The deficiency had to be made up by his fellow-clansmen.

Summary

The Dorobo horde consists of a loosely integrated group of districts held together partly by the feeling that they are all Dorobo, but much more by the clan ties which cut across the district boundaries. The clan is therefore one of the chief institutions in the life of the Dorobo.

MAIN CULTURAL FEATURES

Camps

Housing

(a) **Forest type**: the *kocwogat*, in one or two as late as 1927, was a framework of sticks bent over to form an oblong, dome-shaped structure, covered on the outside with banana leaves and leaves of trees; height, 6 ft.; length, 11 ft.; width, 7 ft. (b) **New types**: the *kwiet* has a circular wall about 5 ft. high plastered with mud, and an almost flat thatched roof supported by a centre post; the *kut* is a hut of ordinary Nandi type, the walls of which are occasionally left unplastered.

Settlements in the forest, consisting of three or four *kocwogat* huts, were situated in clearings just big enough to hold the huts, and were approached by concealed paths which branched in a bewildering manner that made it impossible to find them without a guide. Settlements outside the forest are arranged in small groups usually close to the cultivated land.

Dress and Ornaments

Clothing is made largely from the skins of wild animals, and the forms are mainly copied from those of the Nandi, as are most of the ornaments, which include, among other things, iron wire armlets and leglets, necklaces, and married women's ear-rings (*tauk*). The ear-lobes are pierced and elongated (sometimes getting torn in the forest), and a small hole is bored in the top of the ear. Some but not all remove the two lower middle incisors. Hair is allowed to grow to a length of about 3 ins. when it is sometimes covered with a bladder cap, and sometimes dressed with red earth and fat. Occasionally a man has his hair done in pigtails like the Nandi.

Tools and Weapons

Axes and knives are obtained from Nandi smiths, the Dorobo making the wooden handles. Needles are made from old nails and bits of wire which the Dorobo

301 301 large discs of brass wire (*bat*, pl. *tuk*), which are hung from the ears by leather straps (*mwiito*; N. *mwiito*), to which are frequently fastened one or two cowries (*ndowiti*; N. *ndowiti*) (Text-fig. 18). These ear-rings are, as among the Nandi, the sign of marriage. Girls wear skins (*ekwiat*) or cloth (*angat*). They have armlets (*kwiti*, N.) and leglets (*ndapalwot*; N. *ngalwot*) of iron-wire, and necklaces of wire or beads (*mingati*). The edges of skin garments, both of men and women, are generally trimmed and stitched.

Mutilations of the Body.

304 (a) *Ears.*—In both sexes a small hole (*ngalwiti*; *Kony ngalwiti*) is bored in the top of the ear. This among the Nandi is the tribal mark, and it seems to be so among the Dorobo. Both sexes also pierce the lobes of the ears, and elongate them by inserting cylindrical blocks of wood (*kotik ap tiik*, N.), as among the Nandi. Ear-rings are hung from the lobes, which in the case of men are often broken by being caught by branches in the forest.

305 (b) *Teeth.*—Some Dorobo remove the two middle incisors of the lower jaw, like the Nandi and other tribes; others do not. This is done, they say, "*si ko-kuruna-it pich*" (in order that people may become beautiful).

(c) *Sexual Organs.*—Circumcision and clitoridectomy are practised. (See V, "Circumcision.")

Hair.

302 Men wear their hair moderately long; they put oil and red clay (*ngurut*, N.) on the hair, which sometimes becomes matted, as men often are Nandi, particularly women. The head is shaved periodically. Boys put red clay and oil on to the shaved head. Both old men and senior warriors wear beards and moustaches, though to no greater extent than the Nandi. In some old men the beard is even trimmed and pointed. Girls and women shave their heads periodically, and put oil on the shaved heads.

Paint.

Warriors paint their legs with red and white clay, as do the Nandi; they also put red clay on their heads.

Arts and Crafts.

305 [303] The Dorobo have few crafts of their own. They have no knowledge of metal-work, and there are no smiths; all their ironwork is obtained from the Nandi.

(a) Weapons of Chase and War.

411 These consist of bows (*kogeiyôn*), arrows (*kitiet*, *kiyoriotik*, *kiyokkyoniik*, N.; and *ndoroniik*); spears (*ekwarandoiot* or *warandoiot*); swords (*mondito*; or *ratuet*, N.); shields (*kokyet*, N.); and knives (*kondolwet*, N.). Spears, swords, and shields are obtained from the Nandi.

3:Huntingford E-5 (1921-1928)1929 FLA Dorobo FLA

Names.

Before a child is born, the spirit of an ancestor is called upon, and the child receives the name of that ancestor, which he retains throughout his life.[1] At circumcision, a man becomes Arap (arom), "Son of (he-and-so)," *e.g.* a boy named Kipoo, whose father's name is Kimirilig, becomes Kipoo arap (Ki)miriliq, and is known as Arap (Ki)miriliq. Both the masculine and feminine names are mostly Nandi.

55 [182] [281] [111]

Circumcision. (Tum.[a] X.)

The customs connected with circumcision seem to be very similar to those of the Nandi. Boys are circumcised at intervals of about ten years; the ceremony takes place after harvest, about October, when extra food is bought from the Nandi; the actual operation is performed in the early morning. In the case of girls, a circumcision is held when there are sufficient girls in a district of an age to be circumcised; only the clitoris is removed. Circumcision, as among the Nandi, and in ancient Egypt, is a form of initiation into manhood or womanhood, and is preparatory to marriage.

881 [304] [171] [582]

Marriage.

It is usual for Dorobo to have only one wife, as they are unable to support more. The price of a wife is paid chiefly in honey-wine. Before marriage the suitor gives to the girl's father as much honey-wine "as four women can carry." He also gives the parents honey-wine year by year after marriage, and he must give the father caps (*sendet*, pl. *sindwisiet*) made of the skin of the black monkey (*Colobus ellipsodon*). Nowadays, if a Dorobo has any cattle, he sometimes takes a second wife.

583 [585] [595]

Death.

When a Dorobo dies, his body is taken out into the forest, about 200 to 300 yards from his hut, and left for the hyænas (*kimurukat*) to devour.

764

Miscellaneous.

When a Dorobo thanks a person, he spits in the direction of the person, with or without saying "*Kongoi*," N. ("Thanks").

576

The Dorobo call each other in the forest by blowing horns of water-buck (*ibondit*, N.).

[203] [291]

Salutations:—

(a) Of greeting:—To men, "*Supai*"; answer, "*Chem-le*" (lonkin). To girls and women, "*Tilimonga*"; answer, "*Ipi.*"

(b) Of farewell:—"*Saiano*" (good-bye); answer, "*Saiano ak inge*" (good-bye to thee), or, "*Saiano ak ainok*" (good-bye to you).

Except "*Chem-le*" as the answer to "*Supai*," these are the same as in Nandi.

[1] The Nandi also give children "spirit names" (*koiset ap nik*), which, however, are seldom used.

3:Huntingford E-S (1921-1928)1929 FLÁ Dorobo FLÁ

142

one or two features which are worth mentioning; but these are far more likely to be due to environment than to be true racial distinctions.

The Dorobo are usually small in stature, averaging about 5 ft. 6 ins.; this, however, may be accounted for, because, like the Wambuti (Congo Pygmies), they are forest-dwellers.

[144] The Dorobo, like the Nandi and other Nilo-Hamitic peoples, are dolichocephalic, although not markedly so, and in some cases even inclined to mesocephaly. Their skulls tend to slope up from a rather flat frontal bone to the occipital, giving one rather the impression of very slight artificial cranial deformation. Unfortunately, we were unable to obtain any specimens of their crania; but, even if we had, I believe it would have been almost impossible to distinguish them from any Nandi specimens.

[131] For a black race their noses are narrow, being distinctly leptorhine, with a well-formed bridge; this may be accounted for by the fact that, although they live actually on the Equator, they live at an altitude of from 6,000 to 9,000 ft. in the dense forest, where it never really gets hot, and at night it is bitterly cold; hence they show very little tendency towards the true platyrrhine nose, so intimately associated with the tropics. On the whole, the lips of the Dorobo appeared somewhat thinner than those of the Nandi.

Colour of Skin.—The younger children, who presumably have never been out of the forest, were of a distinctly lighter colour than the average (*cf.* Congo Pygmies). Otherwise the Dorobo were of the same colour as the Nandi.

That the Dorobo are habitually hearded, and have hair on their bodies and legs, is an absolute fallacy. It is true, however, that several of the old men whom we met had beards, but no more so than their Nandi neighbours. We met none with hair on their bodies or legs.[1]

Hair.—In hair classification the Dorobo are typical Ulotrichi.

304 [191] *Artificial Deformation and Mutilation.*—The Dorobo, like most Nilo-Hamites, pierce and elongate the lobes of the ears, and it was interesting to note that, in a great many cases, among the old men, these lobes had been broken by being caught by branches in the forest.

The Dorobo usually extract the two middle incisor teeth of the lower jaw. They also practise circumcision and clitoridectomy.

[1] We emphasize this point, because there seems to be an idea that the Dorobo are a "hearded" people, *e.g.*, Mr. Hobley in *Man*, 1905, 39, p. 30. Whatever other sections of the Dorobo may be, the Kimelilo-Kipchephendi certainly are not more hearded than any other tribe. [114]

Physical Characteristics.—The Wanderobo, although on the whole shorter in stature than their neighbours, are by no means a dwarf race. They resemble, very closely, the Dodotho and other tribes of Karamoja (Pl. XXVII, Figs. 3 and 4). A few measurements are appended. 142

The Village.—The Wanderobo village (*chesw*) is characteristically situated on the edge of a very steep or precipitous slope (Pl. XXVIII), and has an inner and outer stockade, added to which every hut (*ko, yukui*) within the village is itself stockaded. Within the village the huts are grouped in twos or threes so as to communicate, by means of a small opening in the stockade through which one can only crawl, with a tiny compound in which there are two or three groups of cooking stones. Similar doorways, easily closed by means of a raft of sticks tied together, lead from one compound to another. The whole effect is very much that of a compact maze. The huts are very small, but some of them have two stories (Text-fig. 20), the lower for habitation and the upper, which opens at the side, for storing grain and property; 361 342

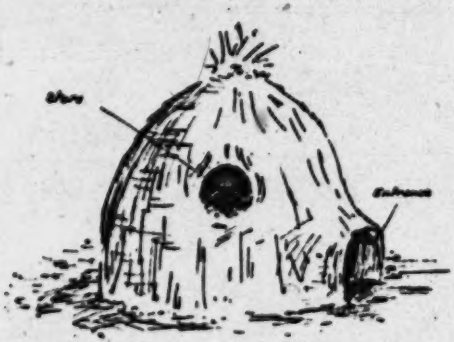

FIG. 20.—AN ANDEROBO HUT (*Yukui*).

they are built of grass, and in some cases the entrance has a little portico. The compounds and huts are kept very clean, and all dirt and rubbish is swept up and dumped outside the village, the limit of which, away from the scarp, is determined by a semi-circular drain that protects the village from run-off during rains. 356

Dress and Adornment.—This is essentially the same as that found among the Labwor, except that cicatrization, apart from the *segwa*, seems to be but little practised. 291 [304]

Livestock.—The Wanderobo are essentially a race of hunters, but they have obtained a few goats from the Dodotho, and they keep dogs. 231 177

Agriculture.—Cultivation is on a small scale, and is generally undertaken at a distance of some miles from the village, in a valley from which they procure their water. The Wanderobo are the tobacco growers of Karamoja, and as an example of the shortness of tribal memory it may be noted that the people say they have always grown tobacco (*lotob*). In addition to this they grow a little semsem (*sunem*), indian corn (*nyaburrigi*), and millet (*ripp*). A form of 241

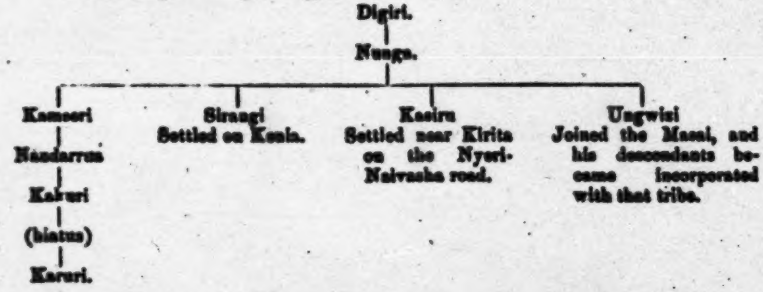
Notes on the Dorobo People and other Tribes; gathered from Chief Karuri and others. *By C. W. Hobley, C.M.G.*

101 The true Dorobo people are called Asi by the Kikuyu people and call themselves Aggiek (or Oggiek) or Ogiechue.

Mr. Hollis tells me that the Nandi call them Okiek (singular Okiot), the Masai Il-Torobo (singular Ol-Toroboni).

131 [648] 173 614 [769] They inhabited the whole of the East Africa highlands from Nandi to Kenia before the Masai invaded the country. The most important clan among the Aggiek is the Digiri (*see* MAN, 1905, 21), the name Digiri being that of their earliest known ancestor. Digiri, however, appears to have lived so long ago that all details about him are lost, and the first ancestor remembered by most is one Nunga, who was a very powerful person, and nearly all the Aggiek are said to trace their origin to this chief.

The following is their genealogy :—



614 [304] [191] Kameeri, Sirangi, and Kasiru are now the names of three clans of the Aggiek.

Before the Masai came none of the Aggiek circumcised and they all spoke one language. The totem of the Aggiek is the ant-bear, which is called Ungaro, they do not eat carnivorous animals or birds of prey, but eat all other animals and birds. [262]

[173] [648] The Digiri have a distinct legend of the invasion of the Masai: they describe how one day a Digiri hunter on the Eunso Narok saw a great company of people coming from the north; the hunter was afraid and hid among the rocks, but he was seen,

D 197 /15 cont./
the El asiti also have their own idiom, which will be briefly discussed at a later place.

M 197 802 184 D 197 802 D M 771 304 619 [197] D M 174 619 [844] [876] Corresponding to the uniformity in language, the number words are the same among the Masai and Wakuafi, whereas the Asá and El asiti have their own words for only a few numbers, but in general always make use of the ones used by the other two branches. One finds a complete correspondence for all three branches in their religious view, and the manner of circumcision customary among both sexes. The peculiar circumcision of the boys is practiced by no other people at all, with the exception of one lineage of the Tatoga, closely related to the Masai people. In birth and death, too, all three have the same customs, while in the rest of their customs one finds only unessential differences which are based solely on the difference in their external way of life. The most striking proof for the three branches' belonging together, however, lies in their descent.

The people as a whole are divided into three large tribes, the Il aiser, the El mulelyan, and the El mengana, each of which is made up of a number of lineages, and every Asá, as well as every Ol kuafi and Ol massani, is a representative of one of these lineages.

P M 614 613 If we now concern ourselves further with the ethnography of the Masai in particular, which is at the same time that of the Wakuafi, we are thereby including the ethnographic traits of the entire people; the stressing of individual differences that have developed among the Wandorobo in the course of time and under the influence of changed conditions will be reserved for the third part.

M 614 613 Every tribe (en gischomi) is divided, as has already been mentioned, into a number of lineages (ol gelata, el gelat). Among these, in turn, one distinguishes principal lineages (ol gelata kitok)

/253 cont./

302 [171] [412] [304] [754] manner as among the Masai, but here the eyebrows are also shaved by both sexes. The nails are cut with an ordinary two-edged knife. The two middle lower incisors are not broken out for everyone. Hair and nail cuttings are thrown away or hidden at some distance from the kraal, so that they will not fall into the hands of an evil sorcerer, who would be able to make from them sorcery leading to a sickness for their former wearer.

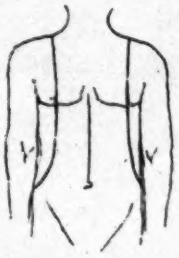

Fig. 87.

302 531 [386] The young men and girls color their entire bodies with a paint made out of fat and red earth (ol garia), or the former also only legs and lower arms, and then wipe off the color again in serpentine lines (lama) that run parallel an inch apart. After killing an elephant [171] the happy hunter paints his chest with three lines, the two outer ones of which go from the collarbone over the nipples to the hips, the middle one from the chest to the navel (Fig. 87), or they paint

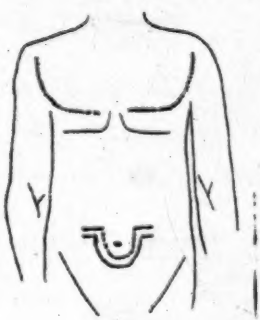

Fig. 88.

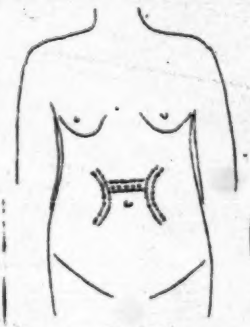

Fig. 89a.

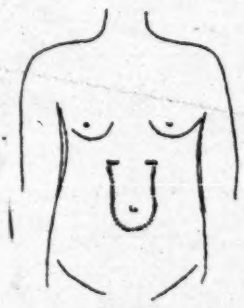

Fig. 89b.

their whole bodies, with the exception of the abdomen, with white and red stripes (like the Masai warriors). The former painting they [192] call katadiridi, the latter they designate with the Masai word en gituñguat. At feasts the men draw a line with the powder ol mogoñgora = root, from the upper lip upward over nose and forehead to the hairline. Boys (Fig. 88) and girls (Fig. 89) tattoo the lyre 304 figure /254/ of the Masai, the latter also another similar one on the 171 abdomen. Not infrequently one also finds on the face of the women [531] the etched-in ol kigerot design, which has been discussed for the Masai.

/431 cont./

142 (2). Palpebral fissure set somewhat obliquely and slit wide. Head hair shaved. Head, from the crown view, rounded, egg-shaped with narrow front end, somewhat flattened at the occiput. From the occipital view, crown and parietal protuberances project angularly. Crown is arched and lies toward the back. Sinciput high, occiput more strongly arched out. Face is broad-oval and in profile orthognathous. Hair edging of the forehead angular-crooked. Forehead high, steep, full-arched. Nose medium-sized, low, rather broad, root of nose flat toward the forehead, bridge of nose somewhat concave, tip blunt and directed straight out, nostrils roundish, alae flat. Lips thin. The two middle lower incisors have been pried out. The gap arising from that has had the effect that the grinding down of the corresponding upper incisors has not taken place parallel to the original chewing surfaces. Rather, the latter stand at an angle of 75° to the (vertical) inner edges of their teeth. The left outer incisor of the upper jaw is missing. It has been pried out, allegedly because it was painful. In general the teeth are small and broad. The ear lobes are considerably enlarged, upper edges of the auricles doubly pierced. The breasts are pendulous, conical, and rather large. The areola of the nipples is very large and a glimmer lighter than the nipple. The latter is very large, strikingly big and projecting. Foot medium-arched. First toe juts out. Hand slender, long-fingered. Nails small, as long as they are broad. Legs thin and straight. Woman has given birth to four children. [163] and is looking forward to her fifth confinement. A large tattooing [304] on the abdomen.

/432 cont./

142 Medium fat. Soft parts medium firm. Skin color: forehead and cheek dark gray-reddish-brown (between 28 and 29), chest and palm of hand somewhat darker (28), back of hand and nipple black-reddish-brown (27). [304] Larger tattooing on the abdomen. Color of the iris: dark-gray--yellow-brown (between 1 and 2). Palpebral fissure set somewhat obliquely and slit wide. Head hair shaved. Head, from the crown view, rounded, egg-shaped with narrow front end, moderately rounded at the occiput. Transverse profile of the occipital view symmetrically rounded. Crown is arched and lies toward the back. Sinciput high, occiput more strongly arched out. Face pointed-oval. Profile slight general prognathism. Chin somewhat projecting. Hair edging of the forehead angular-crooked. Forehead high, steep, full-arched, clearly visible frontal protuberances. Nose medium-sized, low, broad; saddle nose; root of nose very moderately deepened toward forehead; bridge concave; tip blunt and directed straight out; nostrils roundish, alae flat, their lower edge slightly curved upward. Lips moderately thick. The two lower medial incisors have been pried out. Between the two corresponding upper ones there is a natural gap of 5 mm.; through grinding the chewing surface of the left one stands at an angle of 60°, that of the right one at an angle of 75°, to the (vertical) inner edge of its tooth. Analagous to the grinding down of the middle incisors is that of the outer ones and of the canines on each side. The set of teeth is strikingly ugly because of the grinding down of the teeth. The teeth are medium-sized to small. The ear lobes are considerably stretched, the upper ear-edges doubly pierced. Breasts pendulous, conical, large, rather flat. Areola of the nipples large and of the color of the nipple. The latter is medium-sized and not very projecting. Foot medium-arched; first toe juts out. Hand medium slender. Nails small, as long as they are broad. Legs rather sturdy and, except for a rachitic curvature [163] at the shanks, straight. Woman has given birth to four children.

/233 cont./

512 After breakfast the day's work begins. Huts must be repaired
[356] and renovated, for which branches and twigs for the frame, bast
for binding it, and long-stemmed grass for covering the roof and
[462] lining the walls are procured. When the women are not busy with
this, with cooking, with fetching water and gathering firewood, one
usually sees them sitting in the shade with some handwork. They
[294] sew clothing, bags, leather covers for the wooden pots, cut straps,
[281] etc. Concerning the ornaments, the Wandorobo make for themselves
306 those things that the Masai also make for themselves; they only buy
439 the metal-forged work from Masai blacksmiths. The making of the
323
462

Fig. 81. (1/10)

ball-shaped earthen pots (Fig. 81) falls to the women. From dark-gray clay (anjet) they shape the pot with their hands (without a wheel) and let it dry in the sun, after it has been decorated, usually with co[illegible]ornamentation. Before being fired, it is usually stuffed with dried grass prior to being put in a fire made with dried tree bark with which it is entirely covered and in which it remains until it takes on a dark red color. The finished pot, in order "to protect it from cracking during use," is thoroughly heated on the hearth fire, and then boiling water, in which a bone has cooked, is poured in.

281 The dressing of the hides from the most recent hunting booty also takes a great deal of time. Those intended for sale are, of course, simply nicely cleaned of all meat and fatty parts and then, pegged to the ground with sticks, dried in the sun. The others,
[171] however, which are to be used to make clothing, are worked into
000 leather in the way described for the Masai. As there, the tanned

6:Huntingford E-5 (1938-1939) 1953 FL6 Dorobo FL6

The Dorobo divide the year into two parts, *Muainonik*, the dry season, when they used to go hunting the bigger game with bow and arrow; and *Iuot*, the wet season, when they set traps. Each season covers roughly half the year, the rain beginning to tail off in September and getting less and less till January, and then starting to work up again in March, reaching its peak about May; so that *Muainonik* comprises our months of October to March, and *Iuot*, April to September. The Dorobo have twelve months, all but two having the same names as the Nandi months, but they do not synchronize [4]:

Dorobo names:	Nandi names:		
Kipiriruo	*Kipsundet*	October	
Kipsundet	*Kipsundet oiew*	November	
Kipsundet ake	*Mulkul*	December	Muainonik
Mulkul	*Ngotiotet* *	January	
Ngotiotet *	*Kiptamo*	February	
Kiptamo	*Iwat kut*	March	
Iwat kut	*Waket*	April	
Waket	*Ngei* *	May	
Mamut	*Rop tui*	June	Iuot
Rop tui	*Puret*	July	
Puretо	*Epeso*	August	
Yepeset	*Mulkul oiew*	September	

The average rainfall at Kapchorua Farm, about two miles below the edge of the forest for the years 1929 to 1937 was 54.09 inches, the maximum being 66.17, the minimum 28.61. Details are given in the Appendix. In the forest itself I think the rainfall is undoubtedly a little higher, perhaps amounting to another 2-3 ins. in the course of an average year.

The Dorobo seem to have a better weather sense than the Nandi, and I found that they were generally accurate when making a forecast, whereas the Nandi are usually wrong when they try to foretell the weather. This weather sense is perhaps one of the reasons for their reputation among other tribes as rainmakers; for these Dorobo not only say that they have no rainmakers, but I could find no trace whatever of rainmaking activities, nor any hint that they ever had any. Climatic conditions are such, however, that in a hunting economy rainmaking is not a necessity.

The environment of the Dorobo provides them with food, skins, wood, and other vegetable materials. Iron they had not, and they still have no knowledge of ironworking, though they use iron implements. Their activities comprised hunting, trapping, food-gathering, hut-building, the production of honey, and the making of objects of wood, leather, and grass, such as traps, arrow-shafts, bows, honey-barrels, clothing, caps, baskets, and handles for tools. Objects of iron they have got for as far back as they can remember from the Nandi by exchange for such things as they can make or produce themselves.

[4] Throughout this paper I have written the velar nasal by the sign n, representing the "long-tailed s". In words marked * the first consonant is the velar nasal.

12:Dundas G-5 (ca. 1900) 1908 FL6 Dorobo FL6
Kikuyu FL10
Masai FL12

Supi is said to have instructed the Dorobo to bring him a pair of sandals made of leather having hair on both sides, the Masai to bring him a bull, the dung of which was pure white, and the Kikuyu an animal called Huko (a burrowing rat or mole).

The Dorobo cut off the ears of a donkey, and produced these as the required sandals before Supi; the Masai brought a bull fed on milk only; and the Kikuyu the animal called Huko.

Supi then told each tribe to take its respective charm and to attack the enemy separately and at different points.

The Masai, marching into Kikuyu from Naivasha, fell upon the strangers first, and taking all their stock drove them on to the Kikuyu, who in their turn drove them on to the Dorobo, by whom they were finally routed.

The Somali or Galla were thus disposed of, and only by the name Iregi, which was given to the generation that fought with and expelled them, and by a few women of their tribe, taken prisoners by the Dorobo, are we reminded of their settlements in Kikuyu. Amongst these prisoners may be mentioned an old woman called Barabio, who is still alive and resides in one of Burgo's villages. She was formerly Chief Karuri's nurse.

Needless to say the Masai kept all the cattle which they captured, and this caused a rupture between them and the Dorobo and Kikuyu, who joined forces and waged war on them. After a truce had been made the Dorobo and Kikuyu fought amongst themselves.

If the Kikuyu were to live and increase they had to cultivate the ground, and to do so they were obliged to destroy the forests. The very existence, however, of the Dorobo depended on the preservation of the forests, and hence arose a struggle for survival, which allowed of no compromise and could have but one end.*

In an incredibly short time the great primæval forests, the home of the Dorobo, were destroyed, and with them this interesting people ceased to exist as a tribe. Deprived of the means of living, many died, some took to cultivation, whilst the majority migrated to other regions, where they formed small colonies, such as are to be found at Baringo, Naivasha, Ravine, Kijabe, on Laikipia and Mau, at Taveta, in German East Africa, and even, it is said, in places as remote as Kismayu—(the clan that went to this last place was the Agumba). This scattering of the tribe accounts for the peculiar fact that Dorobo living in widely different localities speak the same language.† The Baringo, Naivasha, Kijabe, and Ravine Dorobo, and those of similar colonies will, if questioned as to where they come from, usually mention Kururuma and Kariraui‡ as the birthplace of their fathers.

As regards the origin of this interesting tribe, we know little or nothing. There appear to have been two branches, the Agumba and the Okiek: the former hunted the game on the plains, the latter in the forests. They lived in pits dug in the ground and covered over with leaves of the wild banana; these pits may to this day be seen anywhere in the Kikuyu country, though of course they become more numerous the nearer one approaches the forest. They are also said to have buried their

* The first Kikuyu to come into the country appear to have been almost without exception pastoral, and they accordingly did not interfere at all with the Dorobo. The later arrivals, who seem to have possessed less stock, purchased from individual Dorobo the right to certain pieces of land or forest. For some reason or other just about the time the Somali or Galla were driven out, a sudden very pressing demand for grain appears to have arisen amongst the Kikuyu; this may have been due to one of two causes—the Kikuyu may have lost through sickness a large amount of stock, or there may have been just at this time a sudden influx of agricultural natives.

† Nandi. (In colonies not in touch with Nandi-speaking tribes, the younger generation is rapidly forgetting this language.)

‡ The country lying between the Rivers Boyo and Mathyoya in Kikuyu

[P.191, B]

200-300 ft. in most places. Once the forest is reached, the slope is gradual, ranging from 8,200 ft. to 8,400 ft., though the main river, the Kipkurere, flows through a valley 1,000 ft. deep. The rainfall, taken at Kapchorua farm about two miles from the W. boundary of the forest, averages 56.54 inches over 9 years from 1929 to 1937: the maximum was 70.33 inches in 1937, the minimum 28.61 inches in 1933; in the forest itself the rainfall is undoubtedly higher. The forest is always damp: mists are frequent, and even in the dry weather it is not always quite dry, a condition which is responsible in part for the rather high infant mortality among the Dorobo. On the edge of the forest are glades with a fringe of thorn trees (acacia robusta), and between the forest and the farms is a strip of land, included in the Forest Reserve, which is suitable for cultivation and stock-keeping. The year is divided into two seasons, *Mwainonik*, the dry season from October to March, and *Iwot*, the wet season, from April to September. These determine both the now obsolescent hunting activities, and the increasing agricultural activities.

B. Economic Activities.

The economic life of the Dorobo may be divided into two phases: (1) the old hunting existence, which began to disappear about 1925 when the Government started seriously to restrict their forest life, and (2) the present trapping-agricultural life in which cultivation is becoming of increased importance.

The economic group is either the elementary family or the domestic family (or, the extended family). Sexual division of work overlaps to some extent, but most of the work outside the settlement is done by men (hunting, trapping, woodcutting, and intercourse with the outside world), while the women do the work inside the settlement, except that they collect all the vegetable food from the forest. Agricultural work is performed by both sexes. Things peculiar to women are: the making of clothes, leather work, and baskets; to men: making weapons and other utensils, digging coloured earth, and putting meat on the fire to cook (though the women look after it once it is on the fire).

Jiye FK8
Acholi FK4

part of Acholiland to the neighbouring area of Labwor in Karamoja. No details will be given of this journey, which proved a difficult one on account of the heavy rains. It may be noted, however, that the administrative boundary between Lango and Acholi was found unconformable with the tribal boundary. The line of march after leaving Labwor is indicated on the accompanying map. From the beginning of the journey to Kakamari, in Dodotho, I was accompanied by Captain P. Renny, then O.C. Northern Garrison, to whom I am deeply indebted. Indeed, had it not been for his ever-willing help, many of the enquiries to which this report refers could not have been undertaken. My best thanks are due to the Percy Sladen trustees for generous assistance.[1] Further, I wish gratefully to acknowledge much good advice from Professor C. G. Seligman, Dr. A. C. Haddon, and Sir James Frazer.

2.—KARAMOJA.

For administrative purposes the boundaries of Karamoja, enclosing an area of 7,112 square miles, are defined in the Handbook of Uganda (Second Edition) as follows:—

"Commencing at a point on the boundary between the Uganda and East Africa Protectorates, being the centre of the crater of Mount Elgon, the boundary runs in a straight line to the source of the River Kisimchanga (also known as the Kilim or Greek River) which river it follows to its junction with the Kiboko River, which river it follows to its junction with Lake Gedge; thence in a north-easterly direction to a point on 2° N. Latitude due south of the highest point on Kamalinga mountain. From this point it follows the eastern boundary of Lobor District until it meets the southern boundary of Rudolf Province; thence along the southern boundary until it meets the Turkwel District boundary of Rudolf Province; thence in a southerly direction along the Turkwel District boundary until it meets the River Turkwel or Suam; thence along the Turkwel or Suam to the source of the Suam in Mount Elgon; thence a straight line to the point of commencement."

Until about the middle of 1920 Karamoja was unadministered, except that part of it generally known as Labwor, which was treated as part of the Acholi District. Karamojo is a vast alluvial plain rising very gently in the vicinity of the mountains which tend to be mainly grouped on the eastern and northern sides. The eastward rise, towards the Rift escarpment, is moderately conspicuous. Most of the plain consists of "cotton soil" in and on which are gravels carrying stone tools of a very primitive culture.[2] (Pl. XVIII, Fig. 1.)

The hills and mountains are all composed of ancient crystalline rocks of various sorts except in the south-east where Tertiary lavas and volcanic tuffs are conspicuous. Generally speaking the crystalline rocks are of the Inselberg type.[3] True caves exist, but they are not very common. They are due to weathering along joint planes, except in the Tororo hills where limestone caverns occur.

The area is decidedly a dry one, and if tradition is to be trusted is becoming steadily drier. There are no permanent rivers and, during the dry season, water is obtained from holes—

[1] The Royal Anthropological Institute is also indebted to the Percy Sladen trustees for a grant towards the expenses of publication.

[2] The Stone-Age remains of this area will be dealt with in another publication.

[3] See *Ann. Rept. Geol. Surv. Uganda*, 1925.

Jiye FK8
Acholi FK4

either natural basins, of the nature of solution pits in the gneiss, or artificial excavations. Among the latter, those of Kameon and Loyoro are famous. In both of these places the water-holes are dug in dry stream beds, and those at Loyoro must be 100 feet in depth.

Since the inhabitants of Karamojo are "cattle-people" possessing vast herds, it will be understood that their movements are largely determined by dry-weather water supplies and grazing grounds.

The vegetation is essentially xerophytic, acacia being the most conspicuous form of tree. In the extreme north-east, however, the hills and valleys, particularly the latter, are somewhat densely wooded, and in the gulleys that cut into the escarpment that separates Karamoja from the Turkana country very large fig-trees are not uncommon. Among other interesting trees, the wild olive may be noted.

The term Karamoja District derives from the name Karamojo, the proper name for the southern part of the district inhabited by the Karamojong; the central part of the country is known as Jie and is inhabited by a people of that name; while the northern portion is divided into two: in the N.E. there is Dodotho and on the N.W. Nangiya. Both of these areas are inhabited by people calling themselves Dodothi (Dodotho).

The following subdivisions of the tribal sections are taken (with very slight adaptation) from a "Report on the Karamoja District," by Capt. A. R. Chidlaw Roberts, M.C., Government Press, Entebbe, 1920:—

(1) Karomojo.	Area.
Ngi'muno	Magusi (to Moroto).
Ngi'maziniko	Moroto
Ngi'tepes	„
Ngi'pian	Mani-Mani and Kilim
Ngi'kadama	Debasien Mt.
Ngi'tome	Bakora
Ngi'mosingo	„
Ngi'ngoleriet	„
Ngi'merimong	„
Ngi'kopo	„
Ngi'pei	„

(2) Jie.	Area.
Ngi'rengen	Jie central.
Ngi'kotianga	„ „

Ngi'kotido	„ „
Ngi'panyangara	„ „
Ngi'owtakow	„ „
Ngi'silanga	„ „

6:Huntingford E-5 (1938-1939) 1953 FLA Dorobo FLA

it himself; but this was regarded as unusual in the case of a married man with a comparatively young wife (his wife Cepkemoren was at that time about 25).

While the sexes within the horde are interdependent, the horde as a whole is dependent on the outside world as represented by the Nandi. Not only do some Dorobo now actually live with Nandi, but they depend on them entirely for all their articles of iron, without which they cannot hunt. Socially, however, symbiosis is increasing. Sometimes unattached old men like Arap Cepenko, who was about 70 at the time of my visit, live in huts occupied by Nandi: Arap Cepenko himself was then living with an old woman at Kipkoroon, sharing her hut, and growing a little eleusine at one end of her shamba, but merely as a lodger, having no sexual relations with her, for which both were too old. As he was a poor old man, she fed him and looked after him for nothing. This is true symbiosis, as the late Dr. SELIGMAN called it, and the principle is greatly extended by the Dorobo. For, whatever may be the collective attitude of Nandi to Dorobo, and of Dorobo to Nandi, the Dorobo depend on the Nandi for certain essentials, and the Nandi look to the Dorobo for certain things which they can get most easily from them. To the Dorobo, the Nandi, in the shape of the Nandi blacksmith, is indispensable, and the good will of the Nandi people is equally essential if they are to make use of his services.

The Dorobo do not specialise. Every man learns to make all the things he needs for bee-keeping and hunting (except those made of iron); every woman learns to make baskets and prepare skins. The raw materials exist close at hand, and may be grouped under 5 heads:

(A) Wood: used for huts, implements, honey-barrels, traps, fuel.
(B) Plant material: used for food, medicine, salt, baskets, and timber.
(C) Skins and other animal products: used for clothing, bags, rools, etc.; dung, used to a limited extent for plastering walls.
(D) Earth and stone: coloured earth for painting; granite for grindstones; earth for plastering walls.

(A) Wood. The following trees are used for making weapons, utensils, etc.:
Kwiet (*Ficalhoa* sp.): bows; house-building; honey-barrels.
Masaita: arrow-shafts; firewood.
Kenyanendit: arrow-shafts.
Sosoiyot (bamboo): arrow-shafts; internodes used as water jars.
Kotwywot: traps.
Kimulwot (*vangueria edulis*): traps.
Kelit (*acocanthera* Schimperi): arrow-poison.
Lepekwot (*dracaena* sp.): house-building; honey-barrels.
Kipenpwot (*tilia* sp.): house-building; honey-barrels.
Maruita: house-building; honey-barrels; fire-wood.
Sasawiet (wild banana, *musa ensete*): house-building; honey-barrels.
Tenetwot: honey-barrels; fire-wood.
Pawot (liana): traps; honey-barrels; house-building; any purpose for which rope is required.

Schmidt-Koppers E-5 (1938-1939) 1953 FLA Dorobo FLA

§23 *Kowodet* (euphorbia candelabrum) : honey-barrels.
Mosot : honey-barrels.
Okowiyuit or *Yowdit* (olive, olea chrysophylla) : fire-wood.
Kayanik : fire-wood.
Cowat (lycus sp.) : fire-sticks.
Tost (amber, juniperus procera) : fire-sticks.

§24 (B) Plant material. The following trees and plants provide material for food, salt, medicines, and utensils[*]:

[372] *Sosiot* (dry grass) : tinder for making fire with fire-sticks.
[346] † *Tajawarist* : fibre for baskets.
[370] *Sosiot* (phoenix reclinata palm) : fibre for baskets.
† *Tiiwet* : medicine.
† *Opeito* : medicine.
Kowodet : medicine.
Lepeyanet : medicine.
Sisiwit : medicine.
Sokolot : medicine.
Cowat (urtica sp.) : medicine.
[263] *Tajangwat* (aerulia integrifolia) : salt.
Sowangwat : salt.
[278] *Rotiowet* or *Rotiot* (hagenia aethiopica) : making honey-wine.

§25 (C) Skins and animal products. These include :

237 † *Monkey* : food ; clothing.
[241] † *Antelope* : food ; clothing ; bags ; quivers.
[241] *Pig-gut* : bow-strings.
Feathers : arrows.
† *Honey* : food ; wine ; ritual purposes.
Rumi's fat : ritual purposes.
[283] *Goats* : bride-payment ; ritual purposes.
[282] *Cattle* : bride-payment ; milk ; dung ; hides.
Bush-buck : tails for brooms.

285 The basket most commonly made by the Dorobo is the small *kowpet*, about 6 inches deep and 6 ½ inches wide at the top. This kind of basket is used a good deal by the Dorobo themselves, and is also a frequent article of sale or exchange to the Nandi : *Ainapei kowpenik Nandi*, "we make baskets for the Nandi", as an old woman said. Dorobo women make baskets when they have nothing particular to do, just as European women knit. The materials used are fibre from the midrib of the *sosiot* palm, which is split into thin strips, and bast from a plant called *tajawarist* which is used for sewing the coils of fibre with the aid of a small needle (Fig. 1). The basket maker starts by splitting the *sosiot* fibre, preparing a certain length and biting it off as she

[194] [194] [194] [

1:Huntingford E-4, 5 (1938-1939) 1953 FLÁ Dorobo FLÁ

and lying about on the farms. The only weapon is the bow, *kayapko*, which the Dorobo make themselves from the *kwisel* bow (*Dombeya* sp.); it is about 5 ft. long, and the bowstring, *ewet*, is made from gut of the giant pig, *bondo*. Arrow-shafts are made from the *kwenendet* and *mamata* trees, or from bamboo, *mwinyet*; arrowheads are bought from the Nandi, and are of the Nandi patterns. Arrows are carried in quivers made of hide. Arrow-poison is made from the *kakut* bush (*Acocanthera Schimperi*).

Baskets

Making baskets, *kwopet*, is a common occupation of Dorobo women. They are made from fibre of the *pheenix reclinata* palm, *mwiet*, and sewn with heat made from a plant called *kaparwiet*. The technique is a spiral foundation with a flat then gradually corrugating coil, of the simple over-over type and bee-sting variety, the stitches being spaced out and not close together.

Miscellaneous

Salt used to be made from the ashes of the plant *kaparwiet* (*acacia Seiegriiida*). Red and white earth is found near Timboroa on the east of the Dorobo country, and men go in parties of four or five to dig it, carrying home the earth in large leather bags, mainly in order to sell it to the Nandi who, in 1930, gave them 2s. a bag. Red earth, *ewokwet*, is mixed with fat or ghee-oil for rubbing on the hair; white earthy matter (*chuiit* whence or *Gisii*) is in lumps of a pair of oval discs 3 ft. 6 ins. long with pieces of them stretched across them, somewhat resembling a pair of lumberjack's snow-rackets. These are sometimes used by the Nandi.

Ritual and Religion

Religion

Asista, the sun, is recognized as a being that can supply or withhold the needs of people: *Asis, tgkyon pamyerk*, "*Asis*, fill us with meat," is a common prayer. Some say that *Asista* the moon is his sister, others that she is his mother. Besides *Asis*, it is believed that there is a being called *Tiet*, the thunder, who produces rain, and "the rainbow is his arm which draws up water for him." The Dorobo also believe in spirits, good and bad, both of which are called *ormomdet*, a word which includes the *mik* (ancestral spirits) and *mamumbamik* (evil spirits) of the Nandi. The ancestral spirits have the same significance and functions as those of the Nandi, and though they punish the living for doing evil, they are otherwise friendly and visit the living, travelling in the bodies of snakes, both to see their people and to get food in the form of *kibukwet* (honey and water); spirit-snakes should not be killed.

Divination

The Dorobo appear to have no diviners of their own, and when they have recourse to divination, as in cases of illness or witchcraft, they go to Nandi diviners of the type called *ostoiyoot*, by whom they are charged a small fee. The people called *orkoiyot* (pl. *orkoik*) among the Dorobo are no more than healers or physicians who prepare healing medicines from trees and plants. Although the Dorobo have a reputation among other tribes as powerful rain-makers, they themselves say that they have no rain-makers, which is probably true.

Death and Burial

Very old men and women are buried in narrow holes about 5 ft. deep in which the bodies are laid full length wearing their clothes; one year after an old man's death his children plant a branch of *mukuyuut* (*Ficus* sp.) on his grave and let it grow. Other people are laid out for the hyenas, both sexes on the right side with

6:Huntingford E-5 (1938-1939) 1953 FL6 Dorobo FL6

435 1 bundle of tobacco (about 1 lb.) for 1 bagful of honey.
1 large earthenware pot for 1 large prepared antelope skin.
1 small earthenware pot for 1 small prepared antelope skin.
2 baskets of cereal seed for 1 basket (*kevpet*).
1/- worth of trade beads for 1 gourd full of honey.

[404] The bag used as a measure for honey is the smaller size of *kevpet*, measuring 7 or 8 ins. by 6 ½ or 7 ins. The gourd is about 10 ins. long. The large pot stands about 20 ins. high, the small, about 10 ins., and the large antelope skin is usually a bushbuck, the small one a duiker.

437 There are no special market places or places of exchange. The Dorobo
438 go to the nearest smith or potter and make a bargain, returning later with
[443] the exchange equivalent to collect the goods. There is no language difficulty
[197] in these transactions, for the Dorobo language is no more than an easily understood dialect of Nandi. Getting iron or pottery means going into the Reserve, but to get seeds, tobacco or beads they need only go to the nearest friendly Nandi who has what they want and is willing to make the exchange. Sometimes plant material of medicinal value (i. e. what they think is medicinal value) is substituted for some of the regular exchange articles, but the above list represents the ordinary practice. When Dorobo have money with which to buy what they want instead of exchanging goods, they have the choice of going to the shops at either Songhor in the south, or else at Aruwa in the Nandi Reserve, where there is a collection of Indian shops. The men do not
[562] like their womenfolk to go to these places unescorted, but occasionally some of the bolder ones try to slip away unobserved to Aruwa; they seldom go to Songhor, as it is in the European area.

476 No human group can exist without some form of co-operation, and even when a man lives alone, as he may have to among the Dorobo, he is not because of that cut off from or unable to share in the activities of his horde. Within the family people are interdependent, and in the settlement they help each other. The main activities in which people normally co-operate are four in number: 1. House-building; 2. Hunting; 3. Digging earth; 4. Cultivation.
[462] (1) Building huts is women's work, which a man will do if he has no wife, and
[234] for which he will get help from a relative or chance-fellow. (2) When people hunted game they usually went out in parties, and the kill was shared among
[309] them. (3) Digging earth means a journey of anything up to 10 miles round the edge of the forest and into country where nowadays there are strangers, so people find it both safer and more convenient to go in parties, for though they are in no danger of being attacked, their unconquerable shyness demands numbers to give confidence. (4) In a family or clan group, though each individual has his own
[241] shamba, he will expect both to help and to be helped by the other members.

[376] Together with the spirit of co-operation is the rule of joint consumption. We have already seen how meat is shared according to definite rules; and among the Dorobo certain other things which are hard to come by must also be shared. The chief of these is tobacco, of which when a man has acquired even a small supply, he is supposed to give some to his father, to his wife's

6:Huntingford E-5 (1938-1939) 1953 FL6 Dorobo FL6

241
[361]

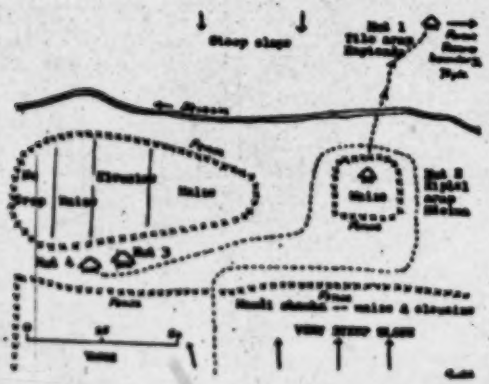

Fig. 6. Plan of a Dorobo Shamba at Kelpui alongside a Nandi Shamba.

at Kipukua in 1938 the crop was so much damaged by monkeys, pigs, and a sort of mole called *keseviat*, that the original shamba had to be given up, and the occupiers took up new and separate plots elsewhere. Sometimes a [illegible] divide the area inside a fence, each contributing to the labour of making it; [648] and in some cases Dorobo share part of a fenced shamba with Nandi (Fig. 6).

● 317 Though not connected with cultivation, we may mention here the subject of earth digging, because it is concerned with the ground. Red and white earth is found near Timboroa (or *Tambarua*, as the Dorobo call it), and men go in parties of four or five to dig it. They use nothing but a digging [482] stick, *kamet*, made of a sharpened stake, and the earth is carried home in [423] large leather bags. In former days, when other Dorobo lived in the earth-producing area, a digging party would ask leave to dig from the man who hunted over that tract of land, and though no fee seems to have been paid, it is said that if a man should refuse his consent, the party would go home without digging. But as no Dorobo now live there, this could not be verified. To-day the Dorobo sell coloured earth to the Nandi, who pay them 439 485 at the rate of 2 shillings for a large bag of earth. Red earth, *crokoit*, is used 302 mixed with fat (or sometimes *simsim* oil) for rubbing on the head; white 789 earth, *cuoriat*, is used as a magical remedy in cases of homicide.

d) Cattle

231 If the Dorobo had not been in such close contact with a people whose 177 primary interest in life was cattle, it is possible that they would have contented 181 themselves with agriculture and no live stock. But their relations with the Nandi have inevitably led them to take an interest in cattle, and to think that the [552] possession of cattle is a desirable thing. Therefore they are slowly trying to acquire cattle, and are in process of making them their ultimate objective. But

3:Huntingford E-5 (1921-1928)1929 FL6 Dorobo FL6

together. The rim is made of a single stick bent in an oval and the ends bound together; across it are fastened pieces of tree-rope.[1] Grindstones (*litito*, N.) have already been mentioned.

The Dorôbo have no knowledge of metallurgy, and they have no musical instruments, pottery, or, apparently, objects of ivory. Metal-work and pottery they buy from the Nandi.[2]

Trade and Commerce.

Trade is by barter. The Dorôbo give the Nandi baskets, dressed skins, and bows in exchange for ironwork, tobacco, pottery, beads, and other necessaries which they cannot produce themselves. There are no special market-places, but goods are taken to any place where there are Nandi, and there exchanged.

Land.

(i) *Tenure.*—The forest is divided by the elders into sections, and each family has its own section of forest. The boundaries between family holdings may be paths or rivers.

(ii) *Geographical Divisions.*—The Dorôbo divide their country into divisions called *koret*, pl. *koroseek* (N.). The chief divisions appear to be called Kipkorom, Sirua, Kimurienge, Sosoiyo (bamboo, N. *tekat*), and Mokopich. The majority of the present place-names are Nandi.

The points of the compass are called as follows:—North and South: Murot (N.). East: Ye-torur (N. *ulin-durur* = up). West: Ye-'rek-to (= where(-the-sun)-descends-thither).

III.—Government.

The Kâmelilo-Kâpchepkendi Dorôbo have now no chief. The last to hold office was Parîngetuny[3] arap Ñgamîngam, who was chief at the time of the Nandi Punitive Expedition, 1905. He is still alive, though he no longer holds office. The chief was elected, and the office was not hereditary. The chief (*kiruogindet* (N.)=councillor) was chosen for "ñgelyepta kitio" ("tongue only" = sense, ability and position). The only form of Government that exists now is a council of elders (*kiruoget ap poiisiek*, N.), who meet and decide on matters which are brought to them. They seem to have little power of enforcing obedience to their decisions, though they claim

[1] This is described and illustrated, although it is a Nandi use, since H.N. does not mention it.

[2] On the use of horns, *see* V, "Miscellaneous." These can hardly be considered as instruments of music.

[3] N. = lion-killer.

6:Huntingford E-5 (1938-1939) 1953 FL6 Dorobo FL6

described as *cemenemsuwet*, i. e. narrow-waisted; she is bigger than the others, with a large head and body and no sting. The workers, called simply *sekemik*, "bees", are considered to be males [8], and the Dorobo say that all the male bees in a swarm fertilize the queen. The queen lives inside the swarm surrounded by the bees, and never goes outside it, being fed by the workers with the honey they make, and she lays her eggs in the fresh combs before any honey has been deposited in them. The workers make honey, according to the Dorobo, by eating the 'water' (*pek*) of the flowers, which they vomit into the empty combs when they return to the swarm [9]. A comb is made (or built, *tec mpokiet* = build the comb) by the mouths of the bees with the help of another substance which they get also from flowers; and from the same source they get wax (*temeniet*) which they bring in on their feet, and use to close up openings in the hive [10]. This is what the Dorobo say. The drone, on the other hand is considered to be a female which does no work and has no sting. The drones just fly about "playing", and as far as the Dorobo can see perform no useful work. They just eat up the honey and after a time the workers kill them, *kotil kitit*, "they cut their necks", so that they shall not eat the whole supply of honey [11]. Terms used to describe bees are:

Kamet = queen (lit. mother).
Sekemik = workers (sing. *sekemiat*).
Kapurenik = drones (sing. *kapuriot*).
Uarek = young bees, grubs (sing. *uaruet*).
Olaloiyet = swarm.
Mpokiet, *Wanasiet* = Empty comb, either new and unused, or old.
Kipiriritiet = comb full of honey.

The Dorobo seem to have no idea of the length of a bee's life, which in Europe may amount to some seven months in the case of bees born in the autumn.

231 [422] [428] Honey-barrels or hives, *pasanet*, are made of slats or of hollowed-out logs and placed in trees for the bees to swarm in. Once a swarm has entered it is considered to belong to the owner to the barrel. If it stays for a long time (the Dorobo say) it may be inherited by the owner's son; but if it should go from one man's barrel into another's, nothing is done, for though the Dorobo say that their bees get to know them, they do not claim to be able to control their movements. And if a swarm deserts a barrel, the owner just [322] waits till another swarm comes to it. The commoner type of honey-barrel is

[8] The workers are really females whose ovaries have become modified so that they do not normally produce eggs.

[9] This is not very far short of the truth, for bees take into their crops a substance called nectar from the flowers and deposit it in the comb. By the action of their saliva, which produces a chemical change, the nectar becomes honey, and is regurgitated into the cells for storage or for feeding the grubs. (Cf. article Bee in the Encyclopaedia Britannica, ed. 11, by Prof. G. H. CARPENTER.)

[10] Wax is really secreted by special cells in the abdomen of the worker bees.

[11] Drones are in reality the males which mate with the queen. When the mating season is over and food is getting scarce, they are killed and thrown out by the workers.

6:Huntingford E-5 (1938-1939) 1953 FL6 Dorobo FL6

that made of hollowed-out logs. A suitable log is cut of such a length as to allow for a length of about 3 ft. 6 ins. in the finished article. Trees specially favoured for making honey-barrels are the *mocet* and *rerendet*, on account of the ease with which they can be worked; others used are the *tenetuet*, *silipcet*, *lepekuet*, *kipsepuet*, and *marorto*. The entire work of shaping and cutting is done with the axe. The log is first split into two equal halves longitudinally, which are then hollowed out, leaving sides about an inch thick. In the bottom of one half an oblong hole is cut, through which the bees can enter and the owner put his hand to take honey. Four holes are bored in the sides of each half with a red-hot boring-needle (Fig. 1), and when the two halves are put together, liana is threaded through the holes to hold them in place.

The slat barrel, not so common as the dug-out because of the difficulty of making the end-pieces, is made of strips or slats of strong bark, the *mocet* and *rerendet* trees being favourites for this purpose. The ends are formed of two solid circles of wood which have to be cut laboriously from a log and trimmed to shape. The bark slats are then put in position round the endpieces and bound together with liana, a tricky piece of work, as anyone who has had to do a similar job will realize; and to get the barrel into place in the tree also requires great care, since it easily collapses if roughly handled. A hand-hole is made in the under side, as in the dug-out type (Fig. 1, 2).

a) and c) Needles; d) for boring, e) for basket work.

Fig. 1. Dug-out Honey-barrel.

When a man puts up a new honey-barrel, he calls out to the bees to come and settle in it [13]. The invocation to bees has a set form, and is uttered in a rather unnatural, high-pitched tone:

Sekem, sekem, ce mii en emotinueen tukul, wa pusi [13] *anyun, ocololion,*
bees, bees, who are in countries-these all, come here now, pour-in-(honey),
ocololion [14].
pour-in-(honey).

Bees do not get ill, they say, but are liable to be killed by heavy rain if they are caught in a storm while getting honey. They have also a number

[13] New swarms take off from a bee colony when it becomes congested. Young queens are allowed to develop, and the old queen leads off a swarm to find a new home.

[13] This obscure expression is said to be equivalent to *Onyon yu*, "come here".

[14] The Nandi have borrowed this formula, and altered it to *Opua ocololion temenai* [illegible] *se lalan*, "come ye, pour wax into the warm hut".

6:Huntingford E-5 (1938-1939) 1953 FL6 Dorobo FL6

224 [816] [220] The year was divided, from the hunting point of view, into the dry season and the wet season. In the wet season people did not generally go out hunting, but stayed at home and set traps to catch antelopes and the like. In the dry season they hunted all sorts of game with bow and arrow in the forest and far afield. Thus, Arap Minio told of how soon after he had been circumcised he was one of a hunting party that went into North Nandi, as far as the hills Kaptepe and Tapsakoi [15] near the modern Turbo, some forty miles from the forest, in the days when there were no Europeans there; and another Dorobo spoke of hunting monkeys as far from home as Kapiyet in North Nandi. Leopard, monkey, and pig are still plentiful. Buffalo still exist to the east, in the direction of Timboroa and Londiani, but they have not been hunted by the Dorobo in recent years, in fact, they say, not since about 1900 when the Kaplelac age were warriors. Elephant are no more, but they were found in this area, according to some old men, when the Sawe and Kipkoimet were warriors about 60 to 70 years ago. There are no lion in the forest, but the Dorobo occasionally shot them in the plains. Leopard used to be hunted by organized parties, but this practice has been discontinued for some years, though they are still attacked and killed by individuals if they get aggressive, as in February 1939, when Arap Singira got his lip torn in a leopard hunt at Sosoiyo. Sometimes traps are made for them, of wire which is picked up on the farms. But trapping leopard is not common, and the trap made by Arap Menati which caught a leopard in July 1938 was said to be exceptional. [231] Generally they prefer to hunt a leopard with dogs, as in the old days, when if one was put up by a dog and climbed a tree, the hunter came and shot it.

[185] There is really no close season, as we understand the expression. The trapping season, which did in fact give the game a respite, was not intended for that purpose, but was for the convenience of the hunters themselves, because when it is wet, the forest is difficult to go through, the undergrowth thick, and the ground muddy and slippery; though some have been known to hunt pig there in wet weather.

[411] Dorobo hunting equipment consisted of a bow, poisoned arrows, quiver, knife, and dogs. Spears have never been used by the Kipkurerek, and the spear trap reported to be found among some Dorobo does not appear ever to have been one of their methods of killing big game. For trapping, a man needs only something to cut the materials with, and, of course, his skill; if he is to make a pit-trap, he needs something to dig with.

411 [322] [239] Bows are made mainly from the *kuriot* tree (teclea sp.) and are about 5 ft. in length. A suitable piece of wood is cut and scraped with a knife-blade till it is smooth and of the right thickness. The bow-string, *inet*, is made of gut from the giant pig, *tumta;* the gut is stretched, greased and twisted till it becomes sufficiently strong and pliable for use. It is knotted to the ends of the bow an inch or so from each end: no notch is cut in the wood to receive it. Arrow-shafts are made from the *koromandet* and *masaita* trees, as well as from split bamboo; they are smoothed with a knife-blade in the same way as

[103]

[15] Better known to Europeans as Kibolosa and Kapsagol.

294 412 283 /233 cont./ As there,[1] the tanned hides are sewed into articles of clothing with an awl (maramaog) and a thread twisted out of animal tendons (asug). If a number of hides for which, at the moment, one has no need for one 's own 439 use has piled up, a few old men with women and children, laden 437 with skins and also steppe salt, set out for a neighboring area. Where the distance between this and the Wandorobo camp is such that it permits frequent trade, these caravans appear at the regularly held markets. If, however, they are able to come only rarely, they [805] peddle their wares, inasmuch as, out of ignorance of time reckoning, they do not wait for the market days. They readily find customers, since both articles are very much in demand. The agriculturalist principally dependent on a vegetable diet always needs salt, but he can only rarely extract it himself, since as a rule the arable soil contains no salt or such not in sufficient quantities. The need for hides /234/ is also often greater than the local production, even today when fabrics have largely replaced the leather clothing. After protracted haggling, an agreement is finally reached, and the Wandorobo, satisfied, set out for home with the bartered vegetables. If the hunting was sometimes particularly lucrative or if an elephant or rhinoceros was killed, part of the meat would also be sold to the always meat-hungry agriculturalists. Many of the latter, for example, the Wataita and Wakamba, also buy the meat of predatory animals from the Wandorobo, others disdain it altogether, and therefore, in trading, they test each piece for smell and taste.

231 [889] Old men, who only now and then in the evening lie in wait for game at a watering place, devote themselves outside the camp especially to the checking and supervision of the beehives (Fig. 82), a large number of which hang within an hour's range. These are wooden tubes 120 centimeters long and /Fig. 82 appears here/ 30 centimeters thick, with an interior breadth of about 25 centimeters. 231 322 412 They are made by hollowing out a correspondingly long piece of tree trunk, a very arduous task because the tools are so primitive. After the trunk, through hewing with an ax, appears circular in cross-section and tapered at both ends, it is smoothed on the outside with a knife (pandyug). Two instruments are used for the hollowing out

1, [i.e., among the Masai--Analyst]

/234 cont./

231 322 [412] the first consists of the ax blade stuck into a wooden handle like a knife and is used as a paring chisel; the other is a hollow chisel (nja) with which one smooths the tubes on the inside. The two openings are closed corklike by flat wooden covers fitting into the opening, into each of which two holes permit entry for the wild bees. For hanging, one puts around the middle part two loops twisted out of lianas, which are connected, handlelike, by a plaiting of lianas, like the straps of a holdall. The beehive is picked up by this handle with a hooked branch, at the upper end of which is lashed a second one with a hook on top. With the latter the whole thing is hung in the branches of taller trees. On the side hanging downward the beehive bears an ownership mark. As a rule it is the same as the one that is burned on the long tang or on the extension tang of the arrow point. On the beehive one finds it either whole or only its lower part. Before the honey is removed /235/ the bees are driven out by a very smoky fire kindled under the tree (1).

231 [283]

[422]

Fig. 82. (1/10)

[171] 1. I never observed among the El dorobo a stupefying of the bees by means of Bovista (Lycoperdon), such as I saw on Kilimandscharo among the Wadschagga.

/235 cont./

231 Then a man climbs up to the beehive, fastens it to a rope, unhooks it, and very slowly lowers it to the ground, so that through the continuing effect of the smoke the bees will also be driven out of the combs or stupefied in them. It is obvious that through this the honey must become very dirty, and, in fact, it tastes strongly of smoke and contains a large number of dead bees and larvae. No other method of driving the bees out is possible, however, and since they are extremely vicious and the people, only scantily clad, expose such large areas for their stings, the honey gatherers have to be enveloped in a thick cloud of smoke for their own protection. I was able to observe the viciousness of the native bees several times. It is by no means rare that a swarm will attack a caravan and sting some of the porters and donkeys into unconsciousness, the latter even to death. Tobacco smoke in particular incites them to attack, but they also seem to dislike loud singing and shouting.

In extracting the honey, one leaves about a quarter of it in each [251] comb so that the bees will not abandon the hive. The extracted honey [415] is packed into leather bags or wooden pots and thus stored. The capture of wild bees is unknown. Where such are found in a hollow [136] tree, one hangs in the vicinity an empty beehive that has previously been smeared on the inside with the extraordinarily aromatic honey of a Melipona species (subspecies Trigona) (2)

2. Identified by Herr Dr. Enderlein from samples sent to the Museum für Naturkunde /Museum of Natural Science/, Berlin.

222 known as el maîn. In order to be able to extract the honey of wild bees from hollow trees, one drives them out by holding aloft a burning branch with which one climbs to the hole.

411 In the camp one sees the men wither squatting about dully or
• 322 busy with carving, such as the beehives just mentioned, or with
[461] making bows, arrows, and clubs. The stick intended for the making
[462] of a bow (Fig. 83) (from the ol borogoi tree) is rounded, cut tapering at both ends, and then scraped smooth. After it has been rubbed

/235 cont./

411 322 283 237 with fat several times, it is bent over the fire. The string is plaited together, turning and braidlike, out of short animal tendons and is extended by further interweaving up to the required length. The projecting starting-ends of the individual pieces of tendon are neatly cut off, whereupon one then rubs the now finished bowstring with some fat.

237 824 412 The arrow shaft (Fig. 84) is carved out of a dry wooden stick, first rounded, then smoothed by scraping. The upper end is wound with tendons that have been coated with the varnishlike juice of a not yet described species of gladiolus known as diriṭṭ, whereupon, on top, one drills in the one- /236/ /Figs. 83 and 84 appear here/ 411 237 136 283 824 centimeter-long hole for the tang of the arrow by a twirling motion with a thin wooden chisel. At the lower end the three-part feathering -- out of the feathers of the carrion vulture (Neophron percnopterus) -- is first fastened on by being wrapped with a very fine bast thread and then glued fast with the gladiolus juice just mentioned. Another wrapping of animal tendons is found between the feathering and the rear notch for the bowstring, in order to prevent a splitting of the shaft.

325 322 171 439 The people buy the iron points; only if a point breaks off /237/ do they as a rule forge a new one for themselves. Clubs are carved from a piece of wood, as among the Masai. They buy the spears, of which there are one or more in almost every camp, from the blacksmiths of the Masai. The spears serve as weapons only in the camp, where shooting with arrows is not permitted, on account of the danger connected with that, since they are always poisoned.

415 439 285 The Asá for the most part buy wooden bowls and gourd bottles from sedentary tribes. On the other hand, in some places they plait shallow baskets, which they use for storing food.

524 829 171 The fact that the Wandorobo do not play the board game so popular among the Masai was explained to me by them with the words: "During the game we would forget to hunt and then, with our families, would have to starve."

512 517 With the coming of darkness complete stillness as a rule comes over the camps, quiet even during the day; the day's work is done and everyone goes to his hut. Only on moonlit evenings do the old 273 535 533 people often still sit in the open for a few hours, talking, with a gourd bottle of honey beer, while the young men and girls dance and let their falsetto song ring out through the still night, from

[TEXT CONTINUED ON PAGE 313]

3:Huntingford E-5 (1921-1928)1929 FL6 Dorobo FL6

together. The rim is made of a single stick bent in an oval and the ends bound together; across it are fastened pieces of tree-rope.[1] Grindstones (*liitto*, N.) have already been mentioned.

The Dorôbo have no knowledge of metallurgy, and they have no musical instruments, pottery, or, apparently, objects of ivory. Metal-work and pottery they buy from the Nandi.[2]

Trade and Commerce.

Trade is by barter. The Dorôbo give the Nandi baskets, dressed skins, and bows in exchange for ironwork, tobacco, pottery, beads, and other necessaries which they cannot produce themselves. There are no special market-places, but goods are taken to any place where there are Nandi, and there exchanged.

Land.

(i) *Tenure.*—The forest is divided by the elders into sections, and each family has its own section of forest. The boundaries between family holdings may be paths or rivers.

(ii) *Geographical Divisions.*—The Dorôbo divide their country into divisions called *kwat*, pl. *kwosuek* (N.). The chief divisions appear to be called Kipkorom, Sirua, Kimurienge, Sosoiyo (bamboo, N. *tekat*), and Mokopich. The majority of the present place-names are Nandi.

The points of the compass are called as follows:—North and South: Murot (N.). East: Ye-torur (N. *ulin-durur* = up). West: Ye-'rek-to (= where(-the-sun)-descends-thither).

III.—Government.

The Kâmelilo-Kâpchepkendi Dorôbo have now no chief. The last to hold office was Parñgetuny[3] arap Ñgamñgam, who was chief at the time of the Nandi Punitive Expedition, 1905. He is still alive, though he no longer holds office. The chief was elected, and the office was not hereditary. The chief (*kiruogindet* (N.)=councillor) was chosen for "ñgelyepta kitio" ("tongue only" = sense, ability and position). The only form of Government that exists now is a council of elders (*kiruoget ap poiisiek*, N.), who meet and decide on matters which are brought to them. They seem to have little power of enforcing obedience to their decisions, though they claim

[1] This is described and illustrated, although it is a Nandi use, since H.N. does not mention it.

[2] On the use of horns, see V, "Miscellaneous." These can hardly be considered as instruments of music.

[3] N. = lion-killer.

7: Wayland N-5 (ca. 1926) 1931 FL6 Dorobo FL6

A form of

beer called *mes* is brewed from *ripp*. Planting is done in a season called *Loukwung*, when there are, or should be, light rains. This is well recognized, as are two other seasons or months: *Lowaru*, a time of rain; and *Loichetto*, a time of much rain.

The Calendar.—The Wanderobo are very hazy about the calendar, and disagree among themselves about it. The "year" appears to be divided into six months, of which the following lists were compiled from those who pretend to know about them. No two agree, it will be noticed, except 3 and 4, which are probably wrong, for my informants displayed much uncertainty.

1.	2.	3.	4.	5.
Ladunga.	*Loukwung.*	*Ladunga.*	*Ladunga.*	*Loukwung.*
Lomuku.	*Ladunga.*	*Loukwung.*	*Loukwung.*	*Lowaru.*
Lokwe.	*Lomuk.*	*Lomuk.*	*Lomuk.*	*Loichetto.*
Lowaru.	*Loichetto.*	*Loichetto.*	*Loichetto.*	*Loudunga.*
?	*Lowaru.*	*Lowaru.*	*Lowaru.*	?
?	?			

Food.—In addition to the above-mentioned grain the Wanderobo will eat almost anything they can get their teeth into, but I do not gather that they will eat human flesh. They will devour any kind of antelope or pig, elephant, rhinoceros, etc., also carnivores of all kinds, except the hyæna; nor do they eat chicken (the Dodotho say that this is because they—the Wanderobo—do not possess any) or snakes. Honey is greatly prized, and bee-traps are set far and wide in the trees.

Division of Labour.—A man's work, except during the hunting season, is wood cutting and attendance on the crops, where his main function is that of a scarecrow. During the hunting season all the able-bodied men leave the village in search of game, which they spear and trap. On wet ground they will actually run down a buck. When the hunters are out, work in the fields and village is done by women, children, and old men. The boys help with the crops, and the girls are employed in the village grinding grain and fetching water with the women. The very old people sit about and take little active part in the life of the community.

Recreations.—The Wanderobo have no musical instruments. They rarely dance, and while the children doubtless play games I gathered no reliable information under this head.

Manufactures.—The Wanderobo are peculiarly wanting in this respect. They make neither baskets nor pottery. The former I did not see among them (the people were found to be using gourds as cooking pots). The latter is obtained from the Dodotho in exchange for tobacco. Their shields (*kraen*) are similarly obtained, while their spears (*biss*) come from the Dodinga country, just over the border in the Sudan. It is noticeable that they use the short stabbing spear. These, it may be noted, are the only tanged spears I saw in Karamoja. They use headrests (*urkichalung*) of Dodotho origin; as with all other tribes in this part of the world, they carry their water in gourds, upon which they frequently carve crude designs.

/233 cont./

512 After breakfast the day's work begins. Huts must be repaired
[356] and renovated, for which branches and twigs for the frame, bast
for binding it, and long-stemmed grass for covering the roof and
[462] lining the walls are procured. When the women are not busy with
this, with cooking, with fetching water and gathering firewood, one
usually sees them sitting in the shade with some handwork. They
[294] sew clothing, bags, leather covers for the wooden pots, cut straps,
[281] etc. Concerning the ornaments, the Wandorobo make for themselves
306 those things that the Masai also make for themselves; they only buy
439 the metal-forged work from Masai blacksmiths. The making of the
• 323
462

Fig. 81. (1/10)

ball-shaped earthen pots (Fig. 81) falls to the women. From dark-gray clay (anjet) they shape the pot with their hands (without a wheel) and let it dry in the sun, after it has been decorated, usually with cord ornamentation. Before being fired, it is usually stuffed with dried grass prior to being put in a fire made with dried tree bark with which it is entirely covered and in which it remains until it takes on a dark red color. The finished pot, in order "to protect it from cracking during use," is thoroughly heated on the hearth fire, and then boiling water, in which a bone has cooked, is poured in.

281 The dressing of the hides from the most recent hunting booty also takes a great deal of time. Those intended for sale are, of course, simply nicely cleaned of all meat and fatty parts and then, pegged to the ground with sticks, dried in the sun. The others,
[171] however, which are to be used to make clothing, are worked into
000 leather in the way described for the Masai. As there, the tanned

3:Huntingford E-5 (1921-1928)1929 FL6 Dorobo FL6

291
301

large discs of brass wire (*tast*, pl. *tatit*), which are hung from the ears by leather straps (*muikto*; N. *monito*), to which are frequently fastened one or two cowries (*sekeriek*; N. *sekerek*) (Text-fig. 18). These ear-rings are, as among the Nandi, the sign of marriage. Girls wear skins (*sluriet*) or cloth (*sugut*). They have armlets (*kurik*, N.) and leglets (*sdapalwet*; N. *tapalwet*) of iron-wire, and necklaces of wire or beads (*sningoit*). The edges of skin garments, both of men and women, are generally trimmed and stitched.

Mutilations of the Body.

304 (a) *Ears.*—In both sexes a small hole (*ongdoriè*; *Kony ingdoriè*) is bored in the top of the ear. This among the Nandi is the tribal mark, and it seems to be so among the Dorobo. Both sexes also pierce the lobes of the ears, and elongate them by inserting cylindrical blocks of wood (*kutik ap tiñik*, N.), as among the Nandi.

[301] Ear-rings are hung from the lobes, which in the case of men are often broken by being caught by branches in the forest.

(b) *Teeth.*—Some Dorobo remove the two middle incisors of the lower jaw, like the Nandi and other tribes; others do not. This is done, they say, "*si ko kwanen-it pirik*" (in order that people may become beautiful).

(c) *Sexual Organs.*—Circumcision and clitoridectomy are practised. (See V, "Circumcision.")

Hair.

302 Men wear their hair moderately long; they put oil and red clay (*ngorut*, N.) on the hair, which sometimes becomes matted, as seen often on Nandi, particularly women. The head is shaved periodically. Boys put red clay and oil on to the shaved head. Both old men and senior warriors wear beards and moustaches, though to no greater extent than the Nandi. In some old men the beard is seen trimmed and pointed. Girls and women shave their heads periodically, and put oil on the shaved heads.

Paint.

Warriors paint their legs with red and white clay, as do the Nandi; they also put red clay on their heads.

Arts and Crafts.

325 [439] The Dorobo have few crafts of their own. They have no knowledge of metallurgy, and there are no smiths; all their ironwork is obtained from the Nandi.

(a) Weapons of Chase and War.

411 These consist of bows (*kogelyôn*), arrows (*kitiot*, *kipartuit*, *kipaldjamit*, N.; and *ndoratit*); spears (*ndamandait?* or *mamandait?*); swords (*mandito*; or *ratuet*, N.); shields (*kokyet*, N.); and knives (*ndambulwet*, N.). Spears, swords, and shields are obtained from the Nandi.

3:Huntingford E-5 (1921-1928)1929 FLA Dorobo FLA

together. The ribs is made of a single stick bent in an oval and the ends bound together; across it are fastened pieces of tree-rope.[1] Ornithimmus (Gothe, K.) have already been mentioned.

The Dorobo have no knowledge of metallurgy, and they have no musical instruments, pottery, or, apparently, objects of ivory. Metal-work and pottery they buy from the Nandi.[2]

Trade and Commerce.

Trade is by barter. The Dorobo give the Nandi hydrate, dressed skins, and honey in exchange for ironwork, tobacco, pottery, beads, and other commodities which they cannot produce themselves. There are no special market-places, but goods are taken to any place where there are Nandi, and there exchanged.

Land.

(i) *Tenure.*—The forest is divided by the elders into sections, and each family has its own section of forest. The boundaries between family holdings may be paths or rivers.

(ii) *Geographical Divisions.*—The Dorobo divide their country into divisions called *kwet*, pl. *kwenuik* (K.). The chief divisions appear to be called Kiptorosa, Sirua, Kimoriongo, Sumiyo (location, K. *sisut*), and Mokogitik. The majority of the present place-names are Nandi.

The points of the compass are called as follows:—North and South: Muren (K.); East: Tu-tuwet (K. *ulu-duwet* = up). West: Tu'tuk-tu (= where the sun) *kumenda-tiktiet*).

III.—Government.

The Kimalilo Kikyakpkondi Dorobo have now no chief. The last to hold office was Parkyiroy[3] arap Ngondigen, who was chief at the time of the Nandi Punitive Expedition, 1905. He is still alive, though he no longer holds office. The chief was elected, and the office was not hereditary. The chief (*kiruogindoi* (K.)=councillor) was chosen for "*kipkyopta bibin*" ("tongue only" = sense, ability and position). The only form of Government that exists now is a council of elders (*kiruogen ap petinik*, K.), who meet and decide on matters which are brought to them. They seem to have little power of enforcing obedience to their decisions, though they claim

[1] This is described and illustrated, although it is a Nandi one, above (K.K. does not mention it).

[2] On the use of bows, see G., "Miscellaneous." These are hardly to considered as instruments of music.

[3] K. = Son-killer.

Schuttingsland B-1 (1934-1935) 1953 FLA Dorobo FLA

The Dorobo divide the year into two parts, *Mwaisowik*, the dry season, when they used to go hunting the bigger game with, bow and arrow; and *Iwet*, the wet season, when they set traps. Each season covers roughly half the year, the rain beginning to fall in September and getting low and low till January, and then starting to work up again in March, reaching its peak about May; so that *Mwaisowik* comprises our months of October to March, and *Iwet*, April to September. The Dorobo have twelve months, all but two having the same names as the Nandi months, but they do not synchronize[1]:

Dorobo names:	Nandi names:		
Kipsiroo	*Kipsunde*	October	
Kipsunde	*Kipsunde aiyo*	November	
Kipsunde ale	*Waliel*	December	*Mwaisowik*
Waliel	*Ngetiet* *	January	
Ngetiet *	*Kipsiwo*	February	
Kipsiwo	*Iyot Iwo*	March	
Iyot Iwo	*Waliel*	April	
Waliel	*Ngo* *	May	
Kiwosi	*Kip no*	June	*Iwet*
Kip no	*Pund*	July	
Pundo	*Kipsa*	August	
Ngosik	*Waliel aiyo*	September	

The average rainfall at Kapsiwowa Farm, about two miles below the edge of the forest for the years 1929 to 1937 was 54.69 inches, the maximum being 91.17, the minimum 29.41. Details are given in the Appendix. In the forest itself I think the rainfall is undoubtedly a little higher, perhaps amounting to another 5.0 ins. in the course of an average year.

The Dorobo seem to have a better weather sense than the Nandi, and I found that they were generally accurate when making a forecast, whereas the Nandi are usually wrong when they try to forecast the weather. This weather sense is perhaps one of the reasons for their reputation among other tribes as rainmakers; for these Dorobo not only say that they have no rain-makers, but I could find no trace whatever of rainmaking activities, nor any hint that they ever had any. Climatic conditions are such, however, that in a hunting economy rainmaking is not a necessity.

The environment of the Dorobo provides them with food, skins, wood, and other vegetable materials. Iron they had not, and they still have no knowledge of ironworking, though they use iron implements. Their activities comprised hunting, trapping, food-gathering, hut-building, the production of honey, and the making of objects of wood, leather, and grass, such as traps, arrow-shafts, bows, honey-barrels, clothing, rope, baskets, and bundles for loads. Objects of iron they have got for as far back as they can remember from the Nandi by exchange for such things as they can make or produce themselves.

[1] Throughout this paper I have written the roots used by the age a, representing the 'long-rolled o', by words marked * the first consonant in the roots used.

/58 cont'd/
intravenously by wholesale rape rather than transfused by peaceful penetration, raised a type of humankind (some of the tribes we have with us today) inferior to themselves. There is very little to general principle common to these two views except that the Dorobo, if it interests them, can claim some small degree of aboriginality in both.

64. Dr. L.S.B. Leakey told the Land Commission:-

"... there are Dorobo and Dorobo. There are Dorobo who are the nucleus of the Dorobo and are a tribe quite distinct from anything I know in this country. They speak a language which I have completely failed to connect up with any of the languages spoken by the other tribes here. There are two or three families living on the Mau today. Round that area you have deserters from Masai, Kikuyu, Nandi, Lumbwa, and all sorts of other people. You thus come across a mixed Dorobo people who have left their tribes and become Dorobo in the wide sense. Up behind Kijabe there are innumerable families, half true Dorobo and half Kikuyu .... They call themselves Kikuyu, but live like Dorobo ..."

65. Modern Kikuyu opinion among the older men is that the Dorobo, though legends suggest a remote relationship with the Kikuyu as well as others, were a separate tribe, speaking a language of their own, who subsequently became mixed up with other people who adopted their way of life. Some identify them with the Il-Kunono of the Masai, but the Dorobo of Kaimia repudiate this and point out that there were no smiths among them and that they bought their spears and iron implements from the Masai and, later on, the Kikuyu. Mr. Jomo Kenyatta, however, regards the Dorobo as a Kikuyu-Gumba blend. In Facing Mount Kenya he writes:

"... soon after the Gumba had disappeared as a race, there came into being another race of hunters known as Ndorobo or Aathi, who seemed to have grown like mushrooms in the forests.

[P.199, B]

and by personal ability, and therefore to some extent by their geographical setting. They have no iron ore, no metallurgic knowledge, and so all ironwork is imported from the Dondi. Tobacco, which they like, is not grown on yet, and this too must be obtained from the Dondi. There is a regular exchange of honey, skins, and baskets, for arrowheads, knives, tobacco, seeds, pottery, etc., and a scale of exchange values has come into existence:

1 arrow head is given for a gourd of honey.
1 bundle of tobacco is given for a bag of honey.
1 large pot is given for a large bushbuck skin.
1 small pot is given for a duiker skin.
1 basketful of meal for one basket.

Sometimes personal services are given, e.g. a day's weeding in the sweet potatoes for one knife.

Cattle are obtained from the Dondi, to a limited extent, by a system of gift exchange for love. The Nandi make friends with the Dondo chiefly for the purpose of getting honey, and the Dondo will give some to his Nandi friend without expectation of an immediate return. Presently the Nandi gives the Dondo a goat, and this exchange of gifts paves the way for further and more important transactions: eventually the Dondo offers his friend a fat cloak for an ox, as e.g. my friend Arap Mitoiy acquired one from a Nandi called Kapkilo ar Ollomo; he also got another in exchange for 7 goats, which he bought out of his wages for working on a farm.

C. Techniques

1. Hunting

The dry weather, *ameinondi*, is the shooting season, and the wet weather, *ainet*, is the time for trapping. The weapon is the bow and arrow (spears are not used by the Kapchepkendi Dondo), and the hunters use dogs.

In wet weather buck are caught in traps. In the dry season, while pig of various kinds[1] were

[1] Bushbuck is about 32 ins. long and 2 ins. wide; 2 varieties (their sizes as much bigger as a goat). A bushbuck (*Tragelaphus*) is about 2 ins. long and 4½ ins. wide at the hip.
[2] Duiker, the most big (*Pseudotragus melampus*) and Tiriet, the small big or bush-pig (*Hylochoerus Meinertzhageni*).

/301 cont./

with fat several times. It is heat over the fire. The string is plaited together, running out beautiful, out of short animal tendons and is extended by further interweaving up to the required length. The projecting starting-ends of the individual pieces of tendon are neatly cut off, whereupon one then rubs the now finished bowstring with some fat.

The arrow shaft (Fig. 54) is carved out of a dry wooden stick, first rounded, then smoothed by scraping. The upper end is wound with tendons that have been coated with the varnishlike juice of a not yet described species of plantlike leaves as *dirr*, whereupon, on top, one drills in the one- /302/ /Figs. 53 and 54 appear here/ centimeter-long hole for the tang of the arrow by a twirling motion with a thin wooden chisel. At the lower end the three-part feathering -- any of the feathers of the carrion vulture (*Neophron percnopterus*) -- is fine fastened on by being wrapped with a very fine bast thread and then glued fast with the plantlike juice just mentioned. Another wrapping of animal tendons is found between the feathering and the rear notch for the bowstring, in order to prevent a splitting of the shaft.

The people buy the iron points only if a point breaks off /303/ do they as a rule forge a new one for themselves. Clubs are carved from a piece of wood, as among the Mimi. They buy the spears, of which there are one or more in almost every camp, from the blacksmiths of the Mimi. The spears serve as weapons only in the camp, where shooting with arrows is not permitted, on account of the danger connected with that, since they are always poisoned. The Ask for the most part buy wooden bowls and gourd bottles from neighboring tribes. On the other hand, in some places they plait shallow baskets, which they use for storing food.

The fact that the Wandorobbo do not play the board game so popular among the Mimi was explained to me by them with the words "During the game we would forget to hunt and then, with our families, would have to starve."

With the coming of darkness complete stillness as a rule covers over the camps, quiet even during the day; the day's work is done and everyone goes to his hut. Only on moonlit evenings do the old people often sit in the open for a few hours, talking, with a good bottle of honey beer, while the young men and girls dance and in their falsetto sing ring out through the still night, from

[illegible] 315

AGRICULTURE

The Dorobo began to cultivate in a small way about 30 years ago (or even a little earlier) and at first they grew only *ebembes*. Though their inclinations were to become cattle-owners, conditions were unfavourable to the development of cattle-breeding as a primary activity and they have been forced to make agriculture a serious business; for the methods, implements, and even the seed used in this, they have been indebted to the Nandi.

Land

Those who live in A and B domicile categories (with whom alone we are concerned here) cultivate small plots in the open land which surrounds the forest. They have no rights of tenure, except the temporary ones acquired, according to Kenya law, if they live there as squatters under the Resident Native Labourers Ordinance. Their plots, *sokowet, pl. sokowenik*, range in size from one acre divided into four individual holdings, to half an acre divided into four holdings; in other cases, plots of a quarter to one-fifth of an acre worked by one person. All plots are fenced, and sometimes a living-hut is built inside the fenced area; occasionally it was found that elderly Dorobo were allowed by Nandi squatters to have a little piece of their cultivated land to work.

European farmers in the district, with whom the Dorobo land question was discussed, seemed not unwilling to let the Dorobo live unmolested on their land provided they gave no trouble; but the government authorities thought otherwise, and the position of a Dorobo who did not choose to become a squatter in order to live on what he considered his own land was thus precarious.

Cultivation Methods and Crops

Two main crops are grown, *ebembes, paiek*, and maize, *tjendek*. Millet had not been grown by 1940, though they bought it from the Nandi. Sweet potatoes, *sipsendek*, are sometimes grown in very limited quantities. Implements are the hoe, *chepsil* bee and the panga or cutlass, both obtained from the Nandi. They have also small axes, *sokdiet*, and knives, *rotwet* or *tondobet*.

The growing of crops is regulated by the dry and wet seasons, *mwaiwenik*, from October to March, and *mosiet*, from April to September. The land is prepared between January and April, and planted in April or May according to the rain. Cultivation follows the Nandi method, with paring and burning of new land. The seed of *ebembes* and maize is bought from the Nandi, usually from squatters living nearby. Maize and *ebembes* are planted together in the same plot, though potatoes are generally grown separately. *Ebembes* is reaped in the Nandi manner by cutting off the heads; maize is picked by hand. Granaries of Nandi type are sometimes made, but are seldom erected, as the plots are so small that the loft of a hut can generally hold all that is not eaten on the field (as is often the case with maize). Cereals are roughly ground on slabs of granite in the Nandi manner.

Food

Food in the old days consisted mainly of meat supplemented by honey, wild vegetables, and grain bought by exchange from the Nandi. The food supply is now based on their own agricultural produce, supplemented by such wild foods as they have easy, and by certain other foods when they can be got. Meat is still obtained by trapping, though seldom by hunting; it includes the flesh of antelopes, monkeys, pigs, and leopards. Honey is got, as already described, from honey-hawks. Wild fruit, collected in the forest, includes fruit of the *mosomwiet* (*rubus rigidus*), *kwonjwet* (*clematis simensis*), and *sawenet* (*rosa woosii*, with leaves), the sap of the *sawenet*, and leaves of nettle, *ainet*.

Interesting drink is of two kinds: the Dorobo honey-wine, *kipkwinik* or *kwonik ap ki*, made from honey, and fermented with the long seed-pods of the "*mosop*

I: Huntingford E-4, 5 (1938-1939) 1953 FL6 Dorobo FL6

cide, adultery, and assault. In the first category, incest is punished under the authority of the clan council: the man is beaten, his hut burnt, his honey-barrels destroyed; the woman also is beaten. Witches might be killed under authority of the *kowet* council. In cases of persistent disobedience to the council, the elders could call upon two or three men to force the offender, by moral and physical persuasion, to mend his ways. Of offences in the second category, trespass has already been mentioned (p. 58). Theft, when not dealt with summarily, can be brought to the *kowet* council, which can order payment of compensation. A man accused of stealing food may say, "If I am a thief, may this grass eat me," and place a blade of grass between his teeth. Adultery might be punished by the injured husband, who, if he killed the offender, had to pay blood-cattle. If a man incapacitates another by assaulting him, he must feed him till he recovers. Homicide of a Dorobo of another clan, though not involving primary sanctions, was a serious offence because it meant that the murderer had to get cattle in order to pay compensation. The usual number was nine head of cattle, though when the murderer was a very poor man living alone the number might be reduced. The kind of cattle (male or female) did not matter. The murderer had to provide as many as he could, from his own herd if he had one, or by exchange from the Nandi, or by any other means, including theft. The deficiency had to be made up by his fellow-clansmen.

Summary

The Dorobo horde consists of a loosely integrated group of districts held together partly by the feeling that they are all Dorobo, but much more by the clan ties which cut across the district boundaries. The clan is therefore one of the chief institutions in the life of the Dorobo.

MAIN CULTURAL FEATURES

CRAFTS

Housing

(*a*) Forest type: the *kocongat*, in use as late as 1927, was a framework of sticks bent over to form an oblong, dome-shaped structure, covered on the outside with banana leaves and leaves of trees; height, 6 ft.; length, 11 ft.; width, 7 ft. (*b*) New types: the *ewiet* has a circular wall about 5 ft. high plastered with mud, and an almost flat thatched roof supported by a centre post; the *kot* is a hut of ordinary Nandi type, the walls of which are occasionally left unplastered.

Settlements in the forest, consisting of three or four *kocongat* huts, were situated in clearings just big enough to hold the huts, and were approached by concealed paths which branched in a bewildering manner that made it impossible to find them without a guide. Settlements outside the forest are arranged in small groups usually close to the cultivated land.

Dress and ornaments

Clothing is made largely from the skins of wild animals, and the forms are mainly copied from those of the Nandi, as are most of the ornaments, which include, among other things, iron wire armlets and leglets, necklaces, and married women's ear-rings (*tandi*). The ear-lobes are pierced and elongated (sometimes getting torn in the forest), and a small hole is bored in the top of the ear. Some but not all remove the two lower middle incisors. Hair is allowed to grow to a length of about 2 ins., when it is sometimes covered with a bladder cap, and sometimes dressed with red earth and fat. Ceremonially a man has his hair done in pigtails like the Nandi.

Tools and weapons

Axes and knives are obtained from Nandi smiths, the Dorobo making the wooden handles. Needles are made from old nails and bits of wire which the Dorobo re-

2: Maguire G-5 (ca. 1926) 1927-28
FL6 Dorobo FL6

clans or families,[1] after the manner of the Masai, but there is no difference between their several bearers at the present time. *Mósiro* and *Médiak* Dorobo live and hunt together all over the southern half of the Masai Reserve to-day. They are fairly numerous[2] (for Dorobo), and in many cases are almost indistinguishable, outwardly, from the Masai.

There, however, the similarity ends, as these Dorobo (referred to, henceforward, as *Mósiro* collectively) are the first with whom we have had to deal possessing a language of their own. Reference to the comparative lists of numbers and the list of names of common objects given elsewhere will show the wide difference there is between the language spoken by these people and that of the Masai.

According to Lekite, who was the only man in recent years holding even a semblance of authority among these people, the "home" of the *Mósiro* is at Talamai.[3] He, in common with many Masai and Dorobo elders, admits that the Dorobo originally came from a country designated vaguely as *Juu*,[4] but no living *Mósiroi* can remember the time when the majority of his people did not live at or near to Talamai.

The *Mósiro* are to be found, occasionally, living with the Masai in the kraals of the latter. They are sometimes (particularly when game and honey are scarce) to be found in small rude kraals of their own, close to the Masai. In these kraals will sometimes be seen a few goats or sheep and almost always fowls.[5] More often, however, the *Mósiro* live in tiny communities (sometimes a man, his wife and their children alone) in the depths of the bush. There they exist, houseless save for a rude shelter of skins within a primitive thorn stockade, by hunting and gathering roots and honey. When supplies run short they beg from the Masai. When a large animal is shot or dies from natural causes the *Mósiro* in the vicinity seem to become aware of the event in the most uncanny way. They will appear unexpectedly, make their camp, and remain until the carcass has been completely denuded of flesh. The meat is not eaten quite raw, but is subjected to a hasty charring, the

[1] More probably the former.
[2] Possibly 1000 souls, including the women and children.
[3] See note 3, p. 127. [4] *Above*: in this case meaning the north.
[5] The Masai regard the eating of fowls or eggs as unclean.

2:Maguire G-5 (ca. 1926) 1927-28
FL6 Dorobo FL6

palatable water. A full-grown specimen of this tuber must weigh many pounds, as I have seen them as large as a Rugby football. It is most difficult of detection, having only three or four small oval leaves above ground, but the *Mósiro* seem to be able to find it anywhere. It is generally obtained by digging with a sharpened stick under certain bushes.

The majority of the *Mósiro* (if not all) would seem to inhabit the southern half of the Tanganyika Masai Reserve. There are a few living in Handeni, but close to the southern Masai border and within a day's march of Talamai. North of L'ol-Kisale I have not met with *Mósiro*, though I think there may be a few in the northern areas. There are some *Mósiro* in the vicinity of Lo-'sokonoi. I imagine (though I do not assert positively) that the Dorobo living with the Masai west of the Rift Wall, in the Ketu-'m-beine localities and to the north of Lake Eyasi, are not *Mósiro*, but are *Aramanik*.

Many *Il-Mósiro* are members by adoption of the *'L-Aiser* and *Il-Mólelyan* clans of the Masai, and some have been adopted into the *Il-Marumas* family of the *Il-Meñgana* clan.

Since the above notes were written, I have met with certain *Mósiro* whose housing methods are even more primitive than those already described. These people live in unpleasantly odoriferous "dug-outs" about eight feet below the ground. There is no ventilation, and the cave is generally scooped out beneath the roots of a baobab or other suitable tree. At night the entrance is securely blocked with thorns. The *Mósiro* who live thus differ in no other respect from those already described and, amusingly enough, are much despised by their relatives for their troglodytic existence.

R. A. J. MAGUIRE.

(To be continued)

3:Huntingford E-5 (1921-1928)1929 FL6 Dorobo FL6

II.—Mode of Subsistence.

Houses.

342 [361] The Dorōbo live in little shelters or huts (*kochongot*, pl. *kochongesiek*; N. *kerist*) built in small clearings in the forest; they are made of a framework of sticks stuck in the ground, and bent over, forming a domed roof; the whole is covered on the outside with leaves of trees and banana leaves, which are insufficient, in spite of the addition of an ox-hide on the top, to keep the hut dry inside when it rains. The upright sticks are strengthened by others tied across them with tree-rope. The huts are oblong, with rounded ends, and are of the following average dimensions:—Height, 5 ft. 10 ins.; width, 7 ft. 6 ins.; length, 11 ft. They are occupied for two or three months, after which they become ruinous and "full of fleas," when the [590] family moves to a fresh site. Two to four people live in one hut. One group of huts we saw contained two huts, and had contained a third which had been pulled down. The huts are divided into two parts, the sleeping-place (*itūkto*, N.) and the [353] fire-place, which are separated by two or three poles laid across the floor of the hut, [513] on one side of which are laid ox-hides (*muĉnik*; N. *muiuck*), upon which the occupants eat and sleep; at night they cover themselves with skins. In the other half of the hut is the door (*kurket*, N.), about 2 ft. high. Some huts have two doors, opposite [354] each other. Between the door and the sleeping-place is the hearth (*mūt*, N.), consisting of two or three smallish stones set on the floor. A loft (*suinet*, N.) is sometimes made in this part of the hut, extending across the width, and ending at the beginning of the sleeping-place. The loft is about 2 ft. 6 ins. above the floor, and [251] is made of thin sticks supported on thicker cross-sticks, and tied together with [378] tree-rope. Upon it are kept firewood and eleusine grain (Text-figs. 26–28). The [412] only household utensils are a small broom (*sēltutiet*) about 14 ins. long, made of [415] a bush-buck's tail fastened to a thin wooden handle, for sweeping the floor; "water jars" (*suiyet*) made of a hollowed piece of bamboo about 2½ ins. wide and 2 ft. 8 ins. long; a grindstone (*litūto*, N.) made of granite, for sharpening knives, [439] and for grinding eleusine grain. Gourds and earthenware pots are obtained from the Nandi; the Dorōbo have no stools. Fire is produced by means of fire-sticks (*piinet*; N. *piōnet*) (Text-figs. 11*a*, 11*b*). A thin stick of the chorset tree (*N.*),[1] about 15 ins. long and ½ in. thick, is stood upright on a stick of cedar (*test*)[2] about 26 ins. long and 1 in. wide. The thin stick is called piinet, the cedar stick tasamet. The piinet is held between the palms of the hands, and the hands are rapidly rubbed together, beginning at the top of the piinet and working downwards (Pl. XXVI, Fig. 2). This is repeated until fire is obtained; the piinet drills a hole in the tasamet, and the heated wood-dust thus produced falls on to a knife-blade which is placed underneath. When sufficient heat is obtained it is laid on a small bundle of tinder (*sueyat* (dry grass) or fibre of the porōwet[3] tree), and blown till the tinder kindles.

Other forms of grouping are the fraternal group, where several brothers live together, either in separate huts with their wives and children, or if unmarried sharing one or two huts; and the clan group, in which several elementary or domestic families of the same clan live together.

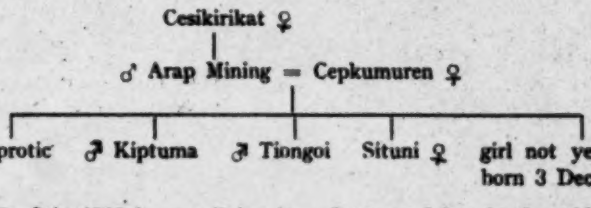
In the old days, by which I mean the time when the Dorobo still lived unmolested by Europeans in the forest, these family and clan groups lived a good deal inside the forest, in small clearings or in glades on the edge. Inside the forest, the clearings were just big enough to contain the number of huts needed by the settlement. The old type of Dorobo hut soon became ruinous and full of fleas (as they put it), and in consequence after a few months a clearing would be abandoned and a new site chosen. These forest settlements were hard for a stranger to find. The path which he was following from the main track would branch a few yards from where it took off, with no indication as to which branch to follow, and whichever he chose, he would find that it branched again after a little way: it was in fact almost impossible to find one's way to one of these settlements without a guide. Most of the Dorobo to-day, however, live on the edge of the forest. Their settlements are consequently easier to find; they are usually close to some cultivation, and are occupied for longer periods.

Family groupings, whether in the forest or outside it, when they are larger than the elementary or domestic family, very often contain someone

4:Huntingford E-5 (1938-1939) 1951 FL6 Dorobo FL6

888 helps his wife to bring up his children, continuing her claim on him in affection which outlasts childhood into old age.

596 My chief friend and informant among the Dorobo, Kimopo arap Mining, lived, during the period of my field-work, at Kipukua, with his mother Cesikirikat, and his family consisted of the following:



[342] [361] In July 1938 he was living in a flat-topped hut in the middle of his section of the settlement; but by December of the same year he had moved to a new hut with a pointed roof outside the *shamba*. His mother's hut was about 300 yards away at the other end of the *shamba*. His three boys (all *Juma* age-set, he himself being a *Nyongi*) ranged from about four years old upwards, and Situni, the elder girl, was about seven. At this time he [513] [231] slept in the back part of the hut, the *incor*, where his goats are kept at night, and his wife slept with the children in the front part, the *koima*. This was because she was suckling a baby. Strictly, Arap Mining should have gone to sleep in another hut, but since this was not possible for several reasons, the wall dividing the *incor* from the *koima* was allowed to make the *incor* count as a separate hut (the original type of Dorobo hut has no partition at all).

855 One day I arrived rather early and found that Cepkumuren had gone across the valley to get a new water-pot, leaving Arap Mining in charge of the children. Situni looked after the baby, but still he found his responsibilities rather a heavy burden, and was glad when his wife returned a little before noon. Cepkumuren fed the baby, sent the children indoors to rest, and went down to the river to wash. At this hour, when there is no particular work to be done, the older people sleep. On some days Cesikirikat comes to Arap Mining's *shamba* to help with the cultivation: Cepkumuren [541] normally works there too, but not every day while the baby is so young. When she does go, Arap Mining goes with her, and the baby is left with Situni. But the *shamba* is not so far away that Cepkumuren cannot hear the children if anything goes wrong.

855 604 The Dorobo elementary family might thus seem to be independent and self-contained. But it is not so really, and other relatives have a share in the upbringing of the children, not in spite of the parents' authority, but in support of it, and the relative who must be considered next to the parents from the Dorobo point of view is the father's brother, *papa*, who often lives in the same settlement, or if not, only a short distance away. This person, especially when he is an elder brother, has a position of authority over his brother's children at least equal to that of their father. His wife, a classi-

6:Huntingford E-5 (1938-1939) 1953 FL6 Dorobo FL6

it himself; but this was regarded as unusual in the case of a married man with a comparatively young wife (his wife Cepkumuren was at that time about 25).

While the sexes within the horde are interdependent, the horde as a whole is dependent on the outside world as represented by the Nandi. Not only do some Dorobo now actually live with Nandi, but they depend on them entirely for all their articles of iron, without which they cannot hunt. Socially, however, symbiosis is increasing. Sometimes unattached old men like Arap Cepsuku, who was about 70 at the time of my visit, live in huts occupied by Nandi: Arap Cepsuku himself was then living with an old woman at Kipkorom, sharing her hut, and growing a little eleusine at one end of her shamba, but merely as a lodger, having no sexual relations with her, for which both were too old. As he was a poor old man, she fed him and looked after him for nothing. This is true symbiosis, as the late Dr. SELIGMAN called it, and the principle is greatly extended by the Dorobo. For, whatever may be the collective attitude of Nandi to Dorobo, and of Dorobo to Nandi, the Dorobo depend on the Nandi for certain essentials, and the Nandi look to the Dorobo for certain things which they can get most easily from them. To the Dorobo, the Nandi, in the shape of the Nandi blacksmith, is indispensable, and the good will of the Nandi people is equally essential if they are to make use of his services.

The Dorobo do not specialize. Every man learns to make all the things he needs for bee-keeping and hunting (except those made of iron); every women learns to make baskets and prepare skins. The raw materials exist close at hand, and may be grouped under 5 heads:

(A) Wood: used for huts, implements, honey-barrels, traps, fuel.
(B) Plant material: used for food, medicine, salt, baskets, and tinder.
(C) Skins and other animal products: used for clothing, bags, roofs, etc.; dung, used to a limited extent for plastering walls.
(D) Earth and stone: coloured earth for painting; granite for grindstones; earth for plastering walls.

(A) Wood. The following trees are used for making weapons, utensils, etc.:

Kuriat (teclea sp.): bows; house-building; honey-barrels.
Masaita: arrow-shafts; firewood.
Koromandet: arrow-shafts.
Sosoiyat (bamboo): arrow-shafts; internodes used as water jars.
Ketuyweet: traps.
Kimolwet (vangueria edulis): traps.
Keliot (acocanthera Schimperi): arrow-poison.
Lepekwet (dracaena sp.): house-building; honey-barrels.
Kipserpwet (tilia sp.): house-building; honey-barrels.
Maroita: house-building; honey-barrels; fire-wood.
Sasuriet (wild banana, musa ensete): house-building; honey-barrels.
Tenetwet: honey-barrels; fire-wood.
Poroet (liana): traps; honey-barrels; house-building; any purpose for which rope is required.

7:Wayland N-5 (ca. 1926) 1931 FL6 Dorobo FL 6

Physical Characteristics.—The Wanderobo, although on the whole shorter in stature than their neighbours, are by no means a dwarf race. They resemble, very closely, the Dodotho and other tribes of Karamoja (Pl. XXVII, Figs. 3 and 4). A few measurements are appended. 142

The Village.—The Wanderobo village (*chwe*) is characteristically situated on the edge of a very steep or precipitous slope (Pl. XXVIII), and has an inner and outer stockade, added to which every hut (*ko, guhai*) within the village is *itself* stockaded. Within the village the huts are grouped in twos or threes so as to communicate, by means of a small opening in the stockade through which one can only crawl, with a tiny compound in which there are two or three groups of cooking stones. Similar doorways, easily closed by means of a raft of sticks tied together, lead from one compound to another. The whole effect is very much that of a compact maze. The huts are very small, but *some* of them have two stories (Text-fig. 39), the lower for habitation and the upper, which opens at the *side*, for storing grain and property; 361 342

Text-fig. 39.—An Akumoro hut (*False*).

they are built of grass, and in some cases the entrance has a little portico. The compounds and huts are kept very clean, and all dirt and rubbish is swept up and dumped outside the village, the limit of which, away from the scarp, is determined by a semi-circular drain that protects the village from run-off during rains. 356

Dress and Adornment.—This is essentially the same as that found among the Labwor, except that circumcision, apart from the ngoro, seems to be but little practised. 291 [304]

Livestock.—The Wanderobo are essentially a race of hunters, but they have obtained a few goats from the Dodotho, and they keep dogs. 231 277

Agriculture.—Cultivation is on a small scale, and is generally undertaken at a distance of some miles from the village, in a valley from which they procure their water. The Wanderobo are the tobacco growers of Karamoja, and as an example of the shortness of tribal memory it may be noted that the people say they have always grown tobacco (*kindi*). In addition to this they grow a little sesamum (*nyoro*), indian corn (*ngakworipi*), and millet (*ngyi*). A form of 241

7: Wayland N-5 (ca. 1926) 1931 FL6 Dorobo FL6

Social Organization.—The Tribe.—The Wanderobo are very few in number, and are divided among three sections, each of which has its own habitat as follows (according to the Chief, who was my informant on this point):— 631 618

Section.	Habitat.	Approximate Numbers.
Kokwaro	Kokwaga	40
Ungwe	Nyangoma	60
Lotwiro	Lotwiro	40

Each section lives in a single village of its own, similar in structure to that already described. The sections are not totemic, but they are exogamous, and descent is in the male line. The tribe has but one chief, who lives at Kokwaga (north of Kisumu). Chieftainship is hereditary, and no woman is ever permitted to wield the powers of a chief. The Ungwe and the Lotwiro 643 622 are each presided over by a headman (paterfamilias).

Birth.—When a child is born the mother is assisted by female relatives. There are no official deliveries, as among the Lulwoo. The Wanderobo allege that there are no special ceremonies connected with birth. Should a child come feet foremost into the world he will be lucky throughout life. It is stated that the afterbirth is thrown away with the rubbish. After weaning, a child occupies his father's hut, if a boy, and her mother's if a girl. 844 858

Betrothal and Marriage.—The rules for betrothal seem to be very similar to those usual among the Lulwoo, except that the prospective husband goes to the girl's people direct, without representation in the first instance. The consent of the girl and of the parents on both sides is necessary, and the number of gifts is not specified as it is among the Lulwoo. 584

Marriage is celebrated by a feast in which the people of the two sections to which the contracting parties belong take part. There is no dance peculiar to the marriage feast. After marriage a man lives for two days and nights in the hut of his betrothed, after which she returns with him to his own village, there to occupy a new hut already built for the newly married couple by the male partner, after he has consulted the wizard with regard to the luckiest time for erecting it. 585 591 342

Burial.—All the dead are buried without special ceremony.* There is a special burial ground, but graves are dug "out in the bush," well away from the village. 764

Age Classes.—These appear to be quite unknown. 561

Crime and Punishment.—The chief offence is adultery. This, however, is a private affair, and is dealt with privately, for it is not a sin against the community. A woman who is guilty in respect of this is cast out by her husband, who seeks the offending man with view to slaying him. Murder is, however, a tribal affair, for which the punishment is death. The Lulwoo practice in this respect is not followed. 684 682

* This statement was subsequently contradicted, in so far as it was stated that the dead abscond at all festivals.

[p230 (K)]

MPK 648 174 787 835

Sapi is said to have instructed the Dorobo to bring him a pair of sandals made of leather having hair on both sides, the Masai to bring him a bull, the dung of which was pure white, and the Elkoye an animal called Hako (a burrowing rat or mole).

The Dorobo cut off the ears of a donkey, and produced these as the required sandals before Sapi; the Masai brought a bull fat on milk only; and the Elkoye the animal called Hako.

Sapi then told each tribe to take its respective shares and to attack the enemy separately and at different points.

PK 179

The Masai, marching into Elkoye from Kaiwaka, fell upon the strangers first, and taking all their stock drove them on to the Elkoye, who in their turn drove them on to the Dorobo, by whom they were finally routed.

D 552 [illegible]

The Somali or Galla were then disposed of, and only by the name Irogi, which was given to the generation that fought with and expelled them, and by a few women of their tribe, taken prisoners by the Dorobo, are we reminded of their settlement in Elkoye. Amongst these prisoners may be mentioned an old woman called Bardile, who is still alive and resides in one of Bargi's villages. She was formerly Chief Karuti's nurse.

179 [illegible] [illegible] 8727

Needless to say the Masai kept all the cattle which they captured, and this caused a rupture between them and the Dorobo and Elkoye, who joined forces and waged war on them. After a truce had been made the Dorobo and Elkoye fought amongst themselves.

PK 311 174 C48

If the Elkoye were to live and increase they had to cultivate the ground, and to do so they were obliged to destroy the forests. The very existence, however, of the Dorobo depended on the preservation of the forests, and hence arose a struggle for survival, which allowed of no compromise and could have but one end.*

In an incredibly short time the great primeval forests, the home of the Dorobo, were destroyed, and with them this interesting people ceased to exist as a tribe. Deprived of the means of living, many died, some took to cultivation, whilst the majority migrated to other regions, where they formed small colonies, such as are to be found at Baringo, Kaiwaka, Kericho, Kijabe, on Lukipia and Mau, at Taveta, in German East Africa, and even, it is said, in places as remote as Kismayu—(the clan that went to this last place was the Aguoiko). This scattering of the tribe accounts for the peculiar fact that Dorobo living in widely different localities speak the same language! The Baringo, Kaiwaka, Kijabe, and Kericho Dorobo, and those of similar colonies will, if questioned as to where they come from, usually mention Kaironum and Kaironj as the birthplace of their fathers.

PK 174 [illegible] [illegible] [illegible] [illegible]

As regards the origin of this interesting tribe, we know little or nothing. There appear to have been two branches, the Aguoiko and the Okiek: the former hunted the game on the plains, the latter in the forests. They lived in pits dug in the ground and covered over with leaves of the wild banana; these give way to tiny huts now anywhere in the Elkoye country, though of course they become more numerous the nearer one approaches the forest. They are also said to have buried their

* The first Elkoye to enter into the country appear to have been almost without exception pastoral, and they accordingly did not interfere at all with the Dorobo. The later arrivals, who seem to have possessed less stock, purchased from individual Dorobo the right to certain pieces of land or forest. For some reason or other just about the time the Somali or Galla were driven out, a sudden very pressing demand for grain appears to have arisen amongst the Elkoye; this may have been due to one of two causes—the Elkoye may have but brought sufficient a large amount of stock, or there may have been just at this time a sudden influx of agricultural natives.

† Dundas. (In addition may be made with Dundas-speaking tribes, the younger generation is rapidly forgetting this language.)

[The country lying between the Nzoia River and Kedjepos in Elkoye.

[P. 196, A]

Economic life to-day is centred more and more on the industry than on hunting. 241 431

The family group is interdependent: the men trap, make tools, protect the family; the women look after house and children, and prepare food; the children, while dependent on their parents for existence, help them with the industry and live-stock, and in various other small ways. 592

There is little specialization, since all men can make trapping and luxury-articles, and all women can make baskets. Joint-production occurs in (1) house-building, when the whole family take part; (2) cultivation; (3) in hunting and in digging coloured earth. Food produced by the family is shared by husband, wife, and children, and also by the husband's and the wife's parents. Meat caught by trapping is divided between the trapper's family and the other people living in the settlement. Vegetable foods are not shared thus, since they can be got by all. Hospitality is given to visiting relatives, clansmen, age-mates (though they do not sleep with their host's wife), and even to stray travellers, once their good faith is established. Beer is drunk at social gatherings of men or women, at clan councils, and on ceremonial occasions. And just as meat is distributed in a particular way (p. 195), so with tobacco: a man who acquires some gives it first to his father, then to his wife's father, and lastly to his brothers and clansmen, if it will go so far.

The typical Dorobo hut, hedegeri, is extremely simple, being no more than a framework of sticks covered with leaves, and a hide on top. They are now building larger and better huts of Nandi type, sometimes with unplastered walls; and an intermediate form may be seen, with a mostly flat roof. 302

D. THE MAGICO-RELIGIOUS ASPECT OF ECONOMIC

That the Dorobo had hunting magic in certain old men say that some had it, while others had none; my friend Arap Mitaly, for example, says he was one of those who had none. Since hunting is the one phase of Dorobo life that appears to be gone for ever as a result of government action (in spite of sporadic individual activities), [illegible]

AGRICULTURE

The Dorobo began to cultivate in a small way about 30 years ago (or even a little earlier) and at first they grew only sweets. Though they subsequently came to become cultivators, cultivation was subordinate to the development of cattle-breeding as a primary activity and they have been forced to make agriculture a serious business, for the livestock, implements, and even the seed used in this, they have been indebted to the Kenia.

Land

Those who live in A and B dorobo categories (with whom alone we are concerned here) cultivate small plots in the open land which surrounds the forest. They have no rights of tenure, except the temporary ones acquired, according to Kenia law, if they live there as squatters under the Resident Native Labourers Ordinance. Their plots, reckoned, pl. *indomeek*, range in size from one acre divided into four individual holdings, to half an acre divided into four holdings, to other cases, plots of a quarter to one-fifth of an acre worked by one person. All plots are fenced, and sometimes a living fence is built inside the fenced area; occasionally a man found that elderly Dorobo were allowed by Kenia squatters to have a little piece of their cattle-eaten land to work.

European farmers in the district, with whom the Dorobo land question was discussed, seemed not unwilling to let the Dorobo live considered on their land provided they gave no trouble, but the government authorities thought otherwise, and the position of a Dorobo who did not choose to become a squatter in order to live on what he considered his own land was then precarious.

Cultivation Methods and Crops

Two main crops are grown, eleusine, *pimik*, and maize, *tamukiet*. Millet had not been grown by 1941, though they bought it from the Kenia. Sweet potatoes, *ngbowuik*, are sometimes grown in very limited quantities. Implements are the hoe, *shagwal* here and the panga, or cutlass, both obtained from the Kenia. They have also small axes, *sikibat*, and knives, *rotuet* or *sambabaet*.

The growing of crops is regulated by the dry and wet seasons, *ongkomok*, from October to March, and *mutat*, from April to September. The land is prepared between January and April, and planted in April or May according to the rain. Cultivation follows the Kenia method, with grazing and burning of new land. The seed of eleusine and maize is bought from the Kenia, usually from squatters living nearby. Maize and eleusine are planted together in the same plot, though pumpkins are generally grown separately. Eleusine is reaped in the Kenia manner by cutting off the heads; maize is picked by hand. Granaries of Kenia type are sometimes made, but are seldom needed, as the yields are so small that the loft of a hut generally held all that is not eaten on the field (as is often the case with maize). Cereals are roughly ground on slabs of granite in the Kenia manner.

Food

Food in the old days consisted mainly of meat supplemented by honey, wild vegetables, and grain bought by exchange from the Kenia. The food supply is now based on their own agricultural products, supplemented by milk when they have any, and by certain other foods when they can be got. Meat is still obtained by trapping, though seldom by hunting; it includes the flesh of antelopes, monkeys, pigs, and leopards. Honey is got, as already described, from honey-barrels. Wild food, collected in the forest, includes fruit of the *mwanunat* (vide *infra*), *kwakwanet* (*Grewia* spp.), *ngotuet*, and *ngaret* [illegible]

Intoxicating drink is of two kinds: the Dorobo honey-wine, *kipketuiek* or *kwonik ap lo*, made from honey, and fermented with the long wood-pods of the *mwanga*

THE FARMS OF THE NORTH CHINESE PLAIN

Introduction

The Chinese began to cultivate in a small way about 30 years ago in some [illegible] and in the long grass only stubble. Though this cultivation was [illegible] in Chinese subsistence conditions and instruments in the development of cattle [illegible] as a primary activity and they have been forced to make agriculture a [illegible] however, for the working implements, and even the seed used to sow, [illegible] have been obtained in the North.

Land

There are five to 6 and 9 hectare categories (with others above as are also [illegible] these categories would give to the open land which surrounds the town. [illegible] have an rights of tenure, except the temporary ones supplied, according to Kroeb [illegible] law, if land has been in occupation under the Chinese Native Landowners Ordinance. [illegible] plots, varieties of agricultural crops in any town are divided into two [illegible] agricultural buildings, of half an acre divided into four buildings, in other cases plots [illegible] of a quarter to one-fifth of an acre divided by one person. All plots are fenced, and [illegible] a living hut is built inside the fenced area, occasionally it was found that [illegible] Chinese were allowed by Kroeb regulations to have a plot given to them with [illegible] land to work.

Everyone farmers in the district, with whom the Chinese land questions may be [illegible] allowed are something to do the Chinese live considered as their land you [illegible] which they gave an example, but the government authorities brought observing, and [illegible] the question of a Chinese who did not choose to become a squatter in order to live on [illegible] to consideration the new land was then [illegible]

Cultivation Methods and Crops

Two main crops are grown, viz-maize, millet and native vegetable. Millet has [illegible] been grown for 1000. Though they bought it from the Kroeb. Some [illegible] vegetable are sometimes grown in very limited quantities. Implements are the hoe, [illegible] digger hoe and the sickle or reaper, both obtained from the Kroeb. They have [illegible] their small area, which does horses, cows or [illegible]

The growing of crops is restricted by the dry and wet seasons, commencing from [illegible] October to March, and ended from April to September. The land is prepared [illegible] between January and April, and planted in April or May according to the rain. [illegible] cultivation follows the Kroeb method, with spring and hoeing of the land. The [illegible] of manure and water is brought from the Kroeb, usually from standard brick [illegible] Water and manure are planted together in the seed pits through [illegible] are generally grown separately. Planting is begun in the Kroeb manner by raising [illegible] the seeds above a ground by hand. Harvesting of Kroeb type are [illegible] seeds, but not without disorder as the yields are so small that the [illegible] generally sold all that is not eaten at the time by a few [illegible] Cereals are roughly ground on stone or grinding in the Kroeb manner.

Food

Food is the all that constant anxiety of most agriculturists in Kroeb, and [illegible] vegetables, and grain bought by exchange from the Kroeb. The food supply [illegible] with based on their own agricultural products, supplemented by cash which they [illegible] have any, and by certain other foods when they can be got. Rice is not obtained [illegible] by trading, though grown by Kroeb, it [illegible] the Kroeb of sovereign sovereign [illegible] and Kroeb. Money is got by [illegible] described, from many [illegible]. With [illegible] [illegible] [illegible]

for found hunting on his area, though he would be liable to pay blood-wards for homicide.

As for trapping, it is said that actively evade most from traps because their bellies would swell to a great size if they ate stolen meat. Public opinion, too, is strongly against such a mean action, and is of itself a powerful deterrent. Horseface trapping is the chief source of meat, and the common practice is for a man to set three or four traps at a time in different places, and to visit them every two days or so to see if anything has been caught.

Monkeys and bush[1] are killed for their meat and skins; pig provide meat and gut for bow-strings.

5. Agriculture[2]

The Dorobo are in process of changing from a hunting to an agricultural existence, from the nomadic hunting economy to the more settled one of agriculture; and the same economic pressure which has forced them to till the soil is now encouraging a desire for cattle, which are being slowly and laboriously acquired. The tribe is here to a more self-supporting state, with less dependence on the Masai for grain crops, and agricultural techniques, both in tillage and stock, are being learnt from the Masai and from Europeans.

Both sexes work in the cultivated plots (shamba), and are helped by children, who weed the crops, herd the stock, and milk the cows. The crops grown at present are chiefly maize (*Mwele* commonly called *mealie* in English) and millet; coffee and tobacco are still bought from the Masai, from whom the Dorobo also get *shauka* cultivation and other necessary. Under the distribution of the forest into hunting areas, people cultivate the ground close to their own homes, and a group

[1] The bush-killed are:

[2] [illegible]

[illegible]

share the labours, each house having its own
crop, the whole being surrounded by a thorn fence
which all help to make. Each is therefore a
family or clan unborn, and the group is an
independent labour unit.

The grain crops are stored either in granaries
of basket-type, or else in the loft (upper) of the hut;
but as most of the crop is eaten before or soon
after it is reaped, and as the yields are not large
owing to the small areas planted, storage problems
are not yet acute. Further supplies of food are
got (i) by purchase or exchange; (ii) by begging

7: Wayland M-5 (ca. 1926) 1931 FL6 Dorobo FL 6

94 [97] [132] A form of
were called *sere* is lowest from *ripp*. Planting is done in a season called *Lenkoreng*, when there are, or should be, light rains. This is well recognized, as are two other seasons or months: *Lemoru*, a time of rain; and *Lekibatu*, a time of much rain.

825 *The Calendar.*—The Wandorobo are very hazy about the calendar, and disagree among themselves about it. The "year" appears to be divided into six months, of which the following lists were compiled from those who pretend to know about them. No two agree, it will be noticed, except 3 and 4, which are probably wrong, for my informants displayed much uncertainty.

1.	2.	3.	4.	5.
Lenkoge,	Lenkoreng	Lenkoge,	Lenkoge,	Lenkoreng
Lemoru	Lenkoge	Lenkoreng	Lenkoreng	Lemoru
Lekoo	Lemoru	Lemoru	Lemoru	Lekibatu
Lemoru	Lenkibatu	Lenkibatu	Lenkibatu	Lenkoge,
?	Lemoru	Lemoru	Lemoru	?
?	?			

262 [772] *Food.*—In addition to the above-mentioned grain the Wandorobo will eat almost anything they can get their teeth into, but I do not gather that they will eat human flesh. They will devour any kind of antelope or pig, elephant, rhinoceros, etc., also carnivorous of all kinds, except the hyæna; nor do they eat chickens (the Dorobo say that this is because they—the Wandorobo—do not possess any) or snakes. Honey is greatly prized, and bee-traps are set for and with in the trees.

462 *Division of Labour.*—A man's work, except during the hunting season, is wood cutting and attendance on the crops, where his main function is that of a scarecrow. During the hunting season all the able-bodied men leave the village in search of game, which they spear and trap. On wet ground they will actually run down a buck. When the hunters are out, work in the fields and village is done by women, children, and old men. The boys help with the crops, and the girls are employed in the village grinding grain and fetching water with the women. The very old people sit about and take little active part in the life of the community.

577 *Recreations.*—The Wandorobo have no musical instruments. They rarely dance, and while the children doubtless play games I gathered no reliable information under this head.

[578] [579] [580] [581] [582] *Manufactures.*—The Wandorobo are peculiarly wanting in this respect. They make neither baskets nor pottery. The former I did not see among them (the people were found to be using gourds as cooking pots). The latter is obtained from the Dorobo in exchange for tobacco. Their skeins (hanks) are similarly obtained, while their spears (*kiri*) come from the Dorobo country, just over the border in the Sudan. It is noticeable that they use the short stabbing spear. These, it may be noted, are the only tanged spears I saw in Kenya. They are handsome (considering) of Dorobo origin; as with all other tribes in this part of the world, they carry their spears in guards, upon which they frequently carve crude designs.

/221 cont./

to dobosoi, i.e., huts of the unmarried men, in contrast to the aija to dalma, the camp of the married. Therefore here, too, we find, even in the name, a separation into kraal of the married and kraal of the warriors, similar to the one mentioned for the Masai.

The arrangement of the interior of the hut, like the form itself, resembles that of the Masai; its furnishings, however, are even sparser. A honey pot (madjé, madjong), a gourd bottle (ngot) for drinking water and honey beer, a leather bag (lebem, lebenge) for collecting honey, a larger one (odaré, ndarerig) for water, a few earthen pots, larger ones (idig, idis) and smaller ones (ngoba, ngoba) for cooking, a couple of wooden bowls (tagi), a rope cut out of an animal skin (mbaro, mbaroge) to tie up the slain meat, a cord twisted out of the bark fibers of the baobab (Adansonia digitata) for the drawing up and letting down of the beehives hung in trees (merikpe), along with a few dehaired skins (lsio) that serve as beds, as well as an (kafe, kaweng) and knife (pandjeng), constitute the principal household equipment. In a few huts one also finds the ax dawra /pack-saddles/ of the Masai, here called laisho (laiswa), as well as a hammer (gitiki) for forging and a chisel for designing the arrow points (mai, mare), and finally that sharpened small piece of sheet iron serving as razor-knife (karé, kaweng). The entire family namely, husband, wife or wives, and the uncircumcised children, live in one /sio/ hut. Men and boys, however, are usually out. The day begins even before daybreak for the hunting men. They set out with a snack consisting of a little piece of boiled or roasted meat, so that the first light of day already finds them in the hunting grounds. The game now between heat; as they say, it does funds more eagerly and cautiously than a few hours later, when the sun already becomes annoying to it. At daybreak women and children leave the huts; firewood and water are carried up in order to cook the meat fetched from a larder lowered to a nearby tree. The meat is kept there and not in the camp, so that it keeps in the air and thus remains fresh longer. After that the morning meal is eaten. Actually the Wandorobbo do not have definite mealtimes as long as there is something edible they simply eat as long as they can.

3:Huntingford E-5 (1921-1928)1929 FLA Dorobo FLA

II.—Huts or Structures.

Houses.

The Dorobo live in little shelters or huts (*kokongwi*, pl. *kokongwinik*; N. *kwiet*) built in small clearings in the forest; they are made of a framework of sticks stuck in the ground, and bent over, forming a domed roof; the whole is covered on the outside with leaves of trees and banana leaves, which are insufficient, in spite of the addition of an ox-hide on the top, to keep the hut dry inside when it rains. The upright sticks are strengthened by others tied across them with tree-rope. The huts are oblong, with rounded ends, and are of the following average dimensions:—Height, 5 ft. 10 ins.; width, 7 ft. 6 ins.; length, 11 ft. They are occupied for two or three months, after which they become verminous and "full of fleas," when the family moves to a fresh site. Two to four people live in one hut. One group of huts we saw contained two huts, and had contained a third which had been pulled down. The huts are divided into two parts, the sleeping place (*ildim*, N.) and the fire-place, which are separated by two or three poles laid across the floor of the hut, on one side of which are laid ox-hides (*mutkuit*; N. *mutwat*), upon which the occupants eat and sleep; at night they cover themselves with skins. In the other half of the hut is the door (*lookor*, N.), about 2 ft. high. Some huts have two doors, opposite each other. Between the door and the sleeping place is the hearth (*ndi*, N.), consisting of two or three smallish stones set on the floor. A loft (*mutwat*, N.) is sometimes made in this part of the hut, extending across the width, and ending at the beginning of the sleeping place. The loft is about 3 ft. 6 ins. above the floor, and is made of thin sticks supported on thicker cross-sticks, and tied together with tree-rope. Upon it are kept firewood and obsolete grain (Text-figs. 30-32). The only household utensils are a small broom (*ndhutiet*) about 14 ins. long, made of a bush-buck's tail fastened to a thin wooden handle, for sweeping the floor; "water jars" (*ongot*) made of a hollowed piece of bamboo about 2½ ins. wide and 2 ft. 9 ins. long; a grindstone (*lolbo*, N.) made of granite, for sharpening knives, and for grinding obsolete grain. Gourds and earthenware pots are obtained from the Nandi; the Dorobo have no stools. Fire is produced by means of fire-sticks (*pirisi*, N. *pirisot*) (Text-figs. 33a, 33b). A thin stick of the obovate tree (*K.j*) about 12 ins. long and ½ in. thick, is stood upright on a *stick of cedar (sarit)* about 18 ins. long and 1 in. wide. The thin stick is called *pirisi*, the cedar stick tenement. The pirisi is held between the palms of the hands, and the hands are rapidly rubbed together, beginning at the top of the pirisi and working downwards (Pl. LXII, Fig. 2). When repeated until fire is obtained, the pirisi drills a hole in the tenement, and the burnt wood-dust thus produced falls on to a hole-blade which is placed underneath. *After ventilation when ignition is to take on a small handful of cedar (sengat (sic) gwan) or fibre of the gudwondi tree), and blown till the cedar kindles.*

[1] Fire-sticks. [2] *Sengat* (sic) *gwan*. [3] *Gudwondi* tree.

/331 cont./

to debeney, i.e., his of the unmarried men, in contrast to the alja to dalima, the emp of the married. Therefore here, too, we find, even in the case, a separation into kraal of the married and kraal of the warriors similar to the one mentioned for the Masai.

The arrangement of the interior of the hut, like the form itself, resembles that of the Masai; its furnishings, however, are even sparser. A honey pot (madjé, maljeug), a gourd bottle (mget) for drinking water and hwy beer, a leather bag (lebenu, lebenua) for collecting honey; a larger one (ndaro, ndarero?g) for water, a few earthen pots, larger ones (idug, idia) and smaller ones (ngubu, ngubu) for cooking; a couple of wooden bowls (tagi), a rope cut out of an animal skin (naru, achéruga) to tie up the slain meat, a cord twisted out of the bast fibers of the baobab (Adansonia digitata) for the drawing up and lifting down of the beehives hung in trees (nerilgoi), along with a few dehaired skins (bilir) that serve as beds, as well as an (bulu, asengi) and knife (pandyng), constitute the principal household equipment. In a few huts one also finds the ax dawara /pack-holder/ of the Masai, here called lalabo (lalewg), as well as a hammer (ribé) for forging and a chisel for designing the arrow points (na mara), and finally that sharpened small piece of sheet iron serving razor-knife (bené, benegi). The entire family, namely, husband, wife or wives, and the uncircumcised children, live in one /kiji/ to. Men and boys, however, are usually out. The day begins even before daybreak for the hunting men. They set out with a mouthful of a little piece of boiled or roasted meat, so that the first light of day already finds them in the hunting grounds. The game now behaves best, as they say. It then feeds more eagerly and calmly than a few hours later, when the sun already becomes angry to it. At daybreak women and children leave the huts; firewood and water are carried up in order to cook the meat fetched by a hunter located in a nearby tree. The meat is kept there and eats the camp, so that it hangs in the air and thus remains fresh longer. After that the returning meat is eaten. Actually the Wandorobo do not have definite mealtimes as long as there is something edible they simply eat as long as they can.

3:Huntingford E-5 (1921-1928)1929 FLA Dorobo FLA

II.—Men of Sengwer.

Houses.

The Dorobo live in little shelters or huts (*kokongoi*, pl. *kokongoiik*; N. *kwiq*) built in small clearings in the forest; they are made of a framework of sticks stuck in the ground, and bent over, forming a domed roof; the whole is covered on the outside with leaves of trees and banana leaves, which are insufficient, in spite of the addition of an ox-hide on the top, to keep the hut dry inside when it rains. The upright sticks are strengthened by others tied across them with tree-rope.[1] The huts are oblong, with rounded ends, and are of the following average dimensions:—Height, 5 ft. 10 ins.; width, 7 ft. 6 ins.; length, 11 ft. They are occupied for two or three months, after which they become verminous and "full of fleas," when the family moves to a fresh site. Two to four people live in one hut. One group of huts we saw contained two huts, and had contained a third which had been pulled down. The huts are divided into two parts, the sleeping place (*ntilio*, N.) and the fire-place, which are separated by two or three poles laid across the floor of the hut, on the side of which are laid ox-hides (*mostoli*; N. *mosioli*), upon which the occupants sit and sleep; at night they cover themselves with skins. In the other half of the hut is the door (*kwobet*, N.), about 2 ft. high. Some huts have two doors, opposite each other. Between the door and the sleeping-place is the hearth (*soli*, N.), consisting of two or three smallish stones set on the floor. A loft (*saiset*, N.) is sometimes made in this part of the hut, extending across the width, and ending at the beginning of the sleeping-place. The loft is about 2 ft. 6 ins. above the floor, and is made of thin sticks supported on thicker cross-sticks, and tied together with tree-rope. Upon it are kept firewood and elevsine grain (Text-figs. 30-32). The only household utensils are a small banana (*sulkutiet*) about 14 ins. long, made of a bush-buck's tail fastened to a thin wooden handle, for sweeping the floor; "water jars" (*saigat*) made of a hollowed piece of bamboo about 15 ins. wide and 2 ft. 6 ins. long; a grindstone (*kitlo*, N.) made of granite, for sharpening knives, and for grinding elevsine grain. Gourds and earthenware pots are obtained from the Dorobi; the Dorobo have no stools. Fire is produced by means of fire-sticks (*pirsat*; N. *pirsat*) (Text-figs. 33a, 33b). A thin stick of the sharuan tree (*Ki.*)[2] about 15 ins. long and ½ in. thick, is stood upright on a stick of cedar (*mutit*) about 30 ins. long and 1 in. wide. The thin stick is called *pirsat*, the cedar stick *tumwet*. The *pirsat* is held between the palms of the hands, and the hands are rapidly rubbed together, beginning at the top of the *pirsat* and working downwards (Pl. XXIII, Fig. 2). Thin dry rotted bark fire is obtained; the *pirsat* drills a hole in the *tumwet*, and the heated wood-dust thus produced falls on to a bark-blade which is placed underneath. When sufficient heat is obtained it is laid on a small bundle of tinder (*saigat ilit gwan*) or fibre of the *gutiroit* tree), and blown till the tinder kindles.

[1] Tree-sp. [2] *Senegalia senegal*. [3] *Acacia* sp.

Physical Characteristics.—The Wanderobo, although on the whole shorter in stature than their neighbours, are by no means a dwarf race. They resemble, very closely, the Dorobo and other tribes of Kenia (Pl. XXVII, Figs. 1 and 2). A few measurements are appended. 192

The Village.—The Wanderobo village (above) is characteristically situated on the edge of a very steep or precipitous slope (Pl. XXVIII), and has no fence and outer stockade, within which every hut (*ho, godo*) within the village is built stockaded. Within the village the huts are grouped in twos or threes so as to communicate, by means of a small opening in the stockade through which one can only crawl, with a tiny compound in which there are two or three groups of cooking stones. Similar doorways, easily closed by means of a sack of sticks tied together, lead from one compound to another. The whole effect is very much that of a compact mass. The huts are very small, but some of them have two stories (Text-fig. 30), the lower for habitation and the upper, which opens on the side, for storing grain and property. 342

Fig. 30.—An overcrowded hut (Dorobo).

They are built of grass, and in some cases the entrance has a little portico. The compounds and huts are kept very clean, and all dirt and rubbish is swept up and dumped outside the village, the limit of which, every time the camp is determined by a semi-circular fence that protects the village from low-roll footing rains. 956

Dress and Ornaments.—This is essentially the same as that found among the Lukuru, except that circumcision, apart from the aspect, seems to be but little practised. 351 (Dorobo)

Livestock.—The Wanderobo are essentially a race of hunters, but they have obtained a few goats from the Dorobo, and they keep dogs. 338

Agriculture.—Cultivation is on a small scale, and is generally undertaken at a distance of some miles from the village, in a valley from which they procure their water. The Wanderobo are the tobacco growers of Kenia, and as an example of the shortness of tribal memory it may be noted that the people say they have always grown tobacco (*tumbi*). In addition to this they grow a little sesame (*ronono*), bulbus corn (*ngabenyiki*), and millet (*ngek*). A form of 341

After breakfast the day's work begins. The must be repaired and renovated, for which branches and twigs for the frame, bast for binding it, and long-stemmed grass for covering the roof and lining the walls are procured. When the women are not busy with this, with cooking, with fetching water and gleaning firewood, one usually sees them sitting in the doors with their handwork. They sew clothing, bags, leather covers for the wooden pots, cut scrapers, etc. Concerning the ornaments, the Wandoh make for themselves those things that the Ideni also make for them; they only buy the metal-forged work from Ideni blacksmiths. The making of the

Fig. 91. Clay pot.

ball-shaped earthen pots (Fig. 91) falls to the women. From dark-gray clay (ocher) they shape the pot with their hands (without a wheel) and let it dry in the sun, after it has been decorated, usually with cord ornamentation. Before being fired, it is usually stuffed with dried grass prior to being put in a fire made of dried cow bark with which it is entirely covered and in which it stays until it takes on a dark red color. The finished pot, in which women prepare their cooking meals, is thoroughly heated on a hearth fire, and then boiling water, in which a bean has cooked, is poured in.

The dressing of the hides from the cows also hunting booty also takes a great deal of time. Those intended for sale are, of course, simply cleverly cleaned of all meat and fatty parts and then, pegged to the ground with sticks, dried in the sun. The others, however, which are to be used to make clothing, are washed into leather in the way described for the Ideni. As soon, the tanned

patronymic from both father's paralign name. Younger men generally take their patronymic from the latter's settlement, or the most recent circumcision to their area then.

Circumcision

Boys are circumcised at the same intervals as the Kwafi, and the Dorobo keep record for the opening of the Kwafi circumcision. Occasionally boys are circumcised by Kwafi with other Kwafi boys, but more often in the forest, as in the circumcision of 1936-37. Sometimes a Dorobo acts as sponsor for the Kwafi. The whole procedure of circumcision rites is identical with that of the Kwafi. Only outrage the operation of circumcision whenever there are enough ready to be done, and not at any stated intervals.

Age-sets

The Dorobo have borrowed the whole age-set system from the Kwafi, and it works exactly as among the Kwafi, with the same six names and 15-year intervals synchronized with those of the Kwafi. The reader may therefore be referred to the account of the Kwafi system, p. 91. A slight difference in the sub-divisions called *mat-aney* by which the Dorobo have only three, called *Lagabach*, the senior; *Tugundi* or *Kipaliliwonyik*, the middle; and *Ramokiandi* or *Kipsiandik*, the junior. A more significant difference is that the girls have no military or political force, for the Dorobo are not fighters, and the psychical effect of the system is to introduce further behavioural patterns, as well as to solidify the traditional rules of hospitality; for while an Dorobo *pundit* refuse to shelter one of his own tonds, the degree of hospitality varies according to the age-set structure.

Economic Organization

Land Relations

The Dorobo live mainly in the settlements divided between a number of clans-in a position (formerly only here). Till about 1930 these settlements were in small clearings inside the forest, after that they were spread round the outer edge of the forest.

The Clan

The clan, *ent*, is an exogamous patrilineal group with a name and a totem, *kwet ap ent*, the eldest of the clan. The existence of eight clans is attested by genealogies and the names, these clans are reported to exist or to have existed, though none occurred in any records they were, however, mentioned to me in 1937 as still as in 1936-8. Each of these clans has one totem, except that which has *kwet*, one of which is shares with another clan; it is not the totem which is important, but the group itself, the clan being a social group, and a group of people supposedly related through their totem. The emphasis is therefore on the clan name and not on the animal, though marriage, nevertheless, is forbidden within the clan, the exception to this rule is found in the case of Kut, where intermarriage is allowed between people of different totems, an exception before the possibly to the influence of the Kwafi, among whom Kut marriages are common between people of different totems. (See p. 91.) There seem to be no restrictions other on marriage between Kwafi (or among the Kwafi), or on killing or eating the clan animal, which suggests that originally the Dorobo have very few totems, and that their present totemism is a feature borrowed from the Kwafi along with the clan names, which except for one of the reported clans are all Kwafi.

"The Kwafi occasionally an agent to this end. [illegible] Kwafi word meaning " the tattoo."

1: Huntingford E-4,5 (1926-1939) 1951 FLA Dorobo FLA

side, adultery, and assault. In the first category, incest is punished under the authority of the clan council: the man is beaten, his hut burnt, his honey-barrels destroyed; the woman also is beaten. Witches might be killed under authority of the forest council. In cases of persistent disobedience to the council, the elders could call upon two or three men to leave the offender, by moral and physical persuasion, to mend his ways. Of offences in the second category, trespass has already been mentioned (p. 76). Theft, when not dealt with immediately, can be brought to the forest council, which can order payment of compensation. A man accused of assaulting local men may say, "If I am a thief, may this grass eat me," and place a blade of grass between his teeth. Adultery might be punished by the injured husband, who, if he killed the offender, had to pay blood-cattle. If a man bewitched another by assaulting him, he must feed him till he recovers. Homicide of a Dorobo or another clan, though not involving primary murderer, was a serious offence, because it meant that the murderer had to get cattle in order to pay compensation. The usual number was nine head of cattle, though when the murderer was a very poor man living alone the number might be reduced. The kind of cattle (male or female) did not matter. The murderer had to provide as many as he could, from his own herd if he had one, or by exchange from the Nandi, or by any other means, including theft. The deficiency had to be made up by his fellow-clansmen.

Summary

The Dorobo horde consists of a loosely integrated group of districts held together partly by the feeling that they are all Dorobo, but much more by the clan ties which cut across the district boundaries. The clan is therefore one of the chief institutions in the life of the Dorobo.

MAIN CULTURAL FEATURES

Camps

Housing

(a) Forest type: the *kowogut*, in use as late as 1927, was a framework of sticks bent over to form an oblong, dome-shaped structure, covered on the outside with banana leaves and leaves of trees; height, 6 ft.; length, 11 ft.; width, 7 ft. (b) Hut types: the *kowet* has a circular wall about 3 ft. high plastered with mud, and an almost flat thatched roof supported by a centre post; the *kut* is a hut of ordinary Nandi type, the walls of which are occasionally left unplastered.

Settlements in the forest, consisting of three or four *kowogut* huts, were situated in clearings just big enough to hold the huts, and were approached by concealed paths which branched in a bewildering manner that made it impossible to find them without a guide. Settlements outside the forest are arranged in small groups usually close to the cultivated land.

Dress and Ornaments

Clothing is made largely from the skins of wild animals, and the forms are mainly copied from those of the Nandi, as are most of the ornaments, which include, among other things, iron wire armlets and leglets, necklaces, and married women's ear-rings (*kach*). The ear-lobes are pierced and elongated (sometimes getting torn in the forest), and a small hole is bored in the top of the ear. Some but not all remove the two lower middle incisors. Hair is allowed to grow to a length of about 2 ins., when it is sometimes covered with a blubber cap, and sometimes dressed with mud, earth and fat. Occasionally a man has his hair done in pigtails like the Nandi.

Tools and Weapons

Axes and knives are obtained from Nandi smiths, the Dorobo making the wooden handles. Needles are made from old nails and bits of wire which the Dorobo

A.Magaiore G-5 (ca. 1936) 1927-28

clans or families," after the manner of the Mussi, but there is no difference between their several houses at the present time. Mbidro and Bilikiri Dandia live and hunt together all over the southern half of the Mussi Reserve to-day. They are hotly enemies* (for Dandia), and in many cases are almost indistinguishable, outwardly, from the Mussi.

There, however, the similarity ends, as these Dandia (referred to, henceforward, as Mbidro collectively) are the first with whom we have had to deal possessing a language of their own. Reference to the comparative lists of numbers and the list of names of common objects given elsewhere will show the wide difference there is between the language spoken by these people and that of the Mussi.

According to Lobito, who was the only man to reveal possessing even a semblance of authority among these people, the "home" of the Mbidro is at Tabassi.* He, in common with many Mussi and Dandia elders, admits that the Dandia originally came from a country designated vaguely as Jau,* but no living Mbidro can remember the time when the majority of his people did not live at or near to Tabassi.

The Mbidro are to be found, occasionally, living with the Mussi in the kraals of the latter. They are sometimes (particularly when game and honey are scarce) to be found in small outlying kraals of their own, close to the Mussi. In these kraals will sometimes be seen a few goats or sheep and almost always fowls.* More often, however, the Mbidro live in tiny communities (sometimes a man, his wife and their children alone) in the depths of the bush. There they exist, homeless save for a rude shelter of skins within a primitive thorn enclosure, by hunting and gathering roots and honey. When supplies run short they beg from the Mussi. When a large animal is shot or dies from natural causes the Mbidro in the vicinity seem to become aware of the event in the most uncanny way. They will appear unexpectedly, make their camp, and remain until the carcase has been completely denuded of flesh. The meat is not eaten quite raw, but is subjected to a hasty charring, the

* More probably the former.
* Possibly one week, including the women and children.

[illegible] Map of the Eighteenth Charter County

[illegible]

In 1938 and 1939 I made a census of the three Gondo districts which were still inhabited, which showed that out of a total of 280 surviving members of the Kirkmichael tonds, 87 (), were living in the forest or on forest days to it. The remaining (), were settled in groups to certain areas of Gondi where they had been for many years, having gone there by private arrangement with the Gondi, and in Cuan Valley, with a few in the Glenmore and Brae districts. Most of these (), maintained fairly constant contact with the forest people, and all were recognized as members of one or other of the three Gondo districts. Under these conditions it is surprising that they have retained so much of their traditional organization, but the segregation of them into groups accounts for some of the difficulties experienced in studying them, and for some of the gaps in the record. Fortunately it was not too late in 1939 to gain a record which, however imperfect, does substantially increase our knowledge of the Gondo.

The dispersal of the Gondo made it necessary to classify the people according to their residence, and this resulted in a grouping of the tonds to four "domestic categories":

I. Tonds the bonds of an aggregate of 6000 ft. and over.

II. Tonds on the edge of the forest, usually over 7000 ft. and within a mile of the forest.

III. Tonds on Gopish Reserve within 10 miles of the forest, with several conditions generally similar to II, but a little lower.

IV. Brae, Glenmore and Cuanbeg where conditions is places are similar to III.

An analysis of the census and domestic categories will be found in the Appendix p. 9.

Here in this paper we are first and only with those parts of the social organization that concern the family and then a short summary of other aspects of Gondo life may be included. The social unit published life of the Gondo is based on the idea which has its core meaning in that with personal affairs and even in day groups live in the groups. This is common to the Tonds where the Gondo are dispersed and play for a small part in common political life. The Gondo is divided into nine divisions or gentiles (Gondo: *ghe tonnandh*) of which only four are now inhabited. These divisions have names (Gondo: pl. 1 *Cuanna*[1], 2 Bridge, 3 Gopi, 4 Glenmore, 5 Gopish, 6 Brae, 7 Kirkcam, 8 Fort, 9 Gopish) to which are Bridge, Glenmore and Gopish were inhabited. No have had been passed with Brae). Each person has a name, which must also express belonging to the division or a short designation of that. The Gondo never suppose the exact date of his birth. Names consist now and then have one underlying significance in the past, but the exact one that a name designed and the thread what has the Gondo consist.

There is no chief of the tonds, but an elected chief at Gopish is called the at Gondo consist the tonding was developed — the committee

Arap Ceruiyo, his brother.
Kipor, his brother.
Kipkutik, his brother.
Simotua, classmate.
Kiptanui, cousin of Arap Cepsumia.
Kwimo, brother of Kiptanui.
Kimitei, his brother.
Cepetip, his sister.
Arap Lengai, relationship not established.
Kerisnai arap Manyenguo, his wife and 3 children.

Xdoroton: Arap Singiro.
Ortuyi, his brother.

Kipkemei, his brother.
Arap Ngeli, Arap Kemei } classmates
Arap Cemamin.
Brother of last two.
Widow with 3 children.
Widow.

Isolated: Arap Kerum, alone.

Upper Ngatopkoo:
Kipiro (Kipiekwo).
Kweyo, his brother.
Kimmeikai, classmate.
Daughter of Kimmeikai.
Kibaror (Kipiekwo).
Arap Eani (Kapsekai).
Kimnorum (Kapsekai).
Sulio arap Silimbo (Tuiyot).

Lower Ngatopkoo*:
(1) Toto arap Kamnik, his wife and 3 children.
(2) Nekai arap Korrom, his wife and son.
(3) Kilunyo arap Kerongon, his wife and 3 children.

* Note that (1) is Kipiekwo, (2) Kaigil, and (3) Kapsekai.

Physical Characteristics.—The Wandonko, although on the whole shorter in stature than their neighbours, are by no means a dwarf race. They resemble, very closely, the Dukwiko and other tribes of Sinoia (Pl. XXVII, Figs. 3 and 4). Their measurements are appended.

The Village.—The Wandonko village (above) is characteristically situated on the edge of a very steep or precipitous slope (Pl. XXVIII), and has an inner and outer stockade, within the which every hut (ie, grain) within the village is built enclosed. Within the village the huts are grouped in twos or threes so as to communicate, by means of a small opening in the stockade through which one can only crawl, with a tiny compound in which there are two or three granaries of cooking stones. Similar clearings, easily closed by means of a raft of sticks tied together, lead from one compound to another. The whole effect is very much that of a compact town. The huts are very small, but some of them have two stories (Text-fig. 94), the lower for habitation and the upper, which opens on the side, for storing grain and property.

Fig. 94.—An erroneous view (False).

They are built of grass, and in some cases the entrance has a little portico. The compounds and huts are kept very clean, and all dirt and rubbish is swept up and dumped outside the village, the limit of which, away from the creek, is determined by a semi-circular fence that protects the village from run-off during rains.

Dress and Adornment.—This is essentially the same as that found among the Lakwas, except that circumcision, apart from the aspirs, seems to be but little practised.

Livestock.—The Wandonko are essentially a race of hunters, but they have obtained a few goats from the Dukwiko, and they keep dogs.

Agriculture.—Cultivation is on a small scale, and is generally undertaken at a distance of some miles from the village, in a valley from which they procure their water. The Wandonko are the tobacco growers of Sumanja, and as an example of the shortness of tribal memory it may be noted that the people say they have always grown tobacco (*bwali*). In addition to this they grow a little sesamum (*mwenje*), native corn (*nyakwanje*), and millet (*nyoli*). A heap of

THE SOCIAL ORGANISATION OF THE DOBUANS

By C. G. S. SELIGMANN

I

The Dobuans, who call themselves Tōdoi, are a [illegible] [illegible] people scattered over the high lands of Dobu and Fergusson. Twelve groups are recorded, and it is known that they are all exogamic, and that all speak dialects of Tōdoi. [illegible] The group which forms the subject of this paper lives in the North Tōdoi Area in the S. E. of the Field Reserve, at an average altitude of over [illegible] 2000 ft., and actually on the equator. In this area there were formerly six inhabited districts, called Sulgwa, Sigibomena, Gwaiyia, Chagaiwa, Nima, and Wabagaiti, which were five or six miles in the south from their another group in Tōdoi-tobi. [illegible] My investigations have been limited [illegible] to the first three of these divisions, since Chagaiwa, Nima, and Wabagaiti no longer exist, and the answers on Tōdoi from a distant group.

At least fifteen years ago the Dobuans were forbidden [illegible] by the government to live in the lower swamps, which comprises the whole of their country, and those that did so, notice an appearance of the Dobuan

Experiments, most fully worthy of a crime-free, but not [illegible] In 1911, in accordance with the decision of the Royal Land Tenure Commission of 1910, they were handed [illegible] and settled in the Crown Reserve. This attempt to settle them existed their native [illegible] failure, and they are now an eyesore for [illegible] group of semi-[illegible] a precarious existence on the [illegible] which extends up to the edge of the forest. Unlike their north as a race, they are [illegible] have a [illegible] and although they are [illegible] in the in March, the majority do not [illegible] to, and are [illegible] especially of being kept [illegible] of their own [illegible]. I had fortunately made [illegible] their acquaintance in 1907, and when I returned to make fuller investigations in 1910, I had little difficulty in overcoming the fear and distrust engendered by the government's actions, and I found that in spite of everything they were still living as far as possible in accordance with their traditional organization.

As regards their numbers, the census I took in [illegible] showed a total of 151 people. This is probably not the full story, but I do not think it is very much short of the real total. The census and genealogies also revealed that they were divided into seven clans, the names [illegible] were enumerated thus:—

[illegible] Thirteen Mess Lists.

[illegible] Before closing this chapter I may not be out of place to say a few words regarding a tribe of people whom I have referred to as the Andorobbo. This tribe, the Wa-ndorobbo of the Wa-swahili, or a small race of people scattered over Masai land, who gain their entire livelihood by the chase. They neither keep cattle nor cultivate the land. The ostrich, the buffalo, and the rhinoceros supply them with meat as they are found, while they always find neighbouring tribes, too glad to barter vegetable food for game. The elephant, however, seems to be their staple food, and as a rule the Andorobbo are to be found only where these animals abound; as for instance, in the Aruwa forests of Kenia and Kilimanjaro, the forest-clad mountains of Meru, the top of Elgeyo, Mongasho, Chibbabongwein, Suey, Doinikh, &c. They are nearly found in numbers, and rarely in very small villages, as the duty in putting the arrow into the enemy does. They enjoy considerable immunity from attack by the Masai, as they set immense store of wealth in the idea by attending the most curious, wealthy are the Masai for both to a considerable number of the army. They also act as gobetweens or middlemen in getting the wanted people the vegetable food they require. So much an extent is this system carried, that on the plateau to the east of Kajiado, at the place called by the native Olmoron, a very large village of Andorobbo have altogether given up hunting, and subsist entirely by buying vegetable food from the Wa-kikuyu and selling it again to the Masai, or to any to the natives.

The language spoken by the Andorobbo is allied to that of the Masai, but they use all much the latter in its purity. They build regular villages, and in general appearance they resemble the inferior class of the Masai. As I have already remarked, they make the indiscriminate slaughter of the women, as well as the young natives, a principle of the creed. They are on the whole looked upon as a species of serf, and treated accordingly. Their connections with the natives must be done secretly, or everything would be stolen from them.

In hunting the elephant the Andorobbo use a peculiar weapon. In shape it is like the runner of a cocoon, the heavy head being intended to give additional weight in darting a blow. In the thickened part is placed a weapon like a short but thick arrow, fifteen inches long, the head of the arrow being covered over with the deadly poison of the snake. The whole spear is little short of eight feet. With this the

2:Maguire G-5 (ca. 1926) 1927-28
FL6 Dorobo FL6

covered with a strip of soft hide—often that of reedbuck or impala—worked to a state of pliability resembling that of chamois leather. The barb is never coated with poison under any circumstance.

A small supply of fresh poison (*ngwaai*) is sometimes carried in the heel of the quiver. This poison is a black, sticky mass made by boiling the leaves of a certain tree and is manufactured exclusively by the Wakamba. The Dorobo know nothing about it, hold it in considerable awe, and have never attempted to make poison of their own.[1]

In the quiver is also carried a fire-stick (*Ol-kiriakgat*) and a fire-block (*sasanda*). The Dorobo are experts at making fire and scorn to use matches. A small flat spoon (*kawalkwandet*) for smearing poison on the arrow-heads is also carried—this spoon is made from the same wood as the bow; and a small knife for smoothing and rounding the arrow-shafts. This knife is called *orwata silfild*.[2] A wooden tube about twelve to eighteen inches long and a quarter of an inch in diameter, not unlike a peashooter, will always be found in a Dorobo quiver. This tube, called *endulet*, is used for drinking from pools which are shallow or which have a dirty, scummy surface. (It is a point of honour with every Dorobo and an unwritten bush law that a man should not stir up the mud in any water at which he drinks.) The *endulet* is also used to induce, by blowing through it, a blaze or clouds of smoke from lighted grass put into a hive to drive the bees away from the honey.

A Dorobo quiver, as we have seen, contains a large number of objects essential to the bush life that the Dorobo leads. It is scarcely to be wondered at, therefore, that it is next to impossible to purchase a furnished one. A Dorobo once told me (I am sure he meant it) that he would not exchange his quiver and its contents for five oxen. The price habitually paid to the parents of a girl taken in marriage is from two to five arrows, and a demand on the parents' part for a full quiver would be regarded as extortionate.

The Dorobo may be seen sometimes with a small axe which

[1] That is, arrow poison. The Dorobo are reputed to have a powerful poison they mix with snuff. When inhaled, it is stated to have a fatal result. I have been unable to obtain a specimen of this poison and doubt its existence.

II.—Mode of Subsistence.

Houses.

342 [361] The Dorobo live in little shelters or huts (*kokenyet*, pl. *kokenyeiik*; N. *kwiet*) built in small clearings in the forest; they are made of a framework of sticks stuck in the ground, and bent over, forming a domed roof; the whole is covered on the outside with leaves of trees and banana leaves, which are insufficient, in spite of the addition of an ox-hide on the top, to keep the hut dry inside when it rains. The upright sticks are strengthened by others tied across them with tree-rope. The huts are oblong, with rounded ends, and are of the following average dimensions:—Height, 5 ft. 10 ins.; width, 7 ft. 6 ins.; length, 11 ft. They are occupied for two or three months, after which they become ruinous and "full of fleas," when the family moves to a fresh site. Two to four people live in one hut. One group of huts we saw contained two huts, and had contained a third which had been pulled down. [542] The huts are divided into two parts, the sleeping-place (*ilikis*, N.) and the fire-place, which are separated by two or three poles laid across the floor of the hut, on one side of which are laid ox-hides (*mat'sik*; N. *masiud*), upon which the occupants eat and sleep; at night they cover themselves with skins. [353] [513] In the other half of the hut is the door (*kurkut*, N.), about 2 ft. high. Some huts have two doors, opposite each other. Between the door and the sleeping-place is the hearth (*mik*, N.), consisting of two or three smallish stones set on the floor. [354] A loft (*mimat*, N.) is sometimes made in this part of the hut, extending across the width, and ending at the beginning of the sleeping-place. The loft is about 2 ft. 6 ins. above the floor, and is made of thin sticks supported on thicker cross-sticks, and tied together with tree-rope. Upon it are kept firewood and elusine grain (Text-figs. 20–26). The only household utensils are a small broom (*sibatiet*) about 14 ins. long, made of a bush-buck's tail fastened to a thin wooden handle, for sweeping the floor; "water jars" (*sotiet*) made of a hollowed piece of bamboo about 2½ ins. wide and 2 ft. 8 ins. long; a grindstone (*kotito*, N.) made of granite, for sharpening knives, and for grinding elusine grain. Gourds and earthenware pots are obtained from the Nandi; the Dorobo have no stools. [251] [378] [412] [415] Fire is produced by means of fire-sticks (*pilnet*, N. *pilnet*) (Text-figs. 11a, 11b). A thin stick of the *chemnet* tree (N.),[1] about 13 ins. long and ½ in. thick, is stood upright on a stick of cedar (*tat*)[2] about 26 ins. long and 1 in. wide. [439] [372] The thin stick is called *pilnet*, the cedar stick *tamnet*. The *pilnet* is held between the palms of the hands, and the hands are rapidly rubbed together, beginning at the top of the *pilnet* and working downwards (Pl. XXVI, Fig. 2). This is repeated until fire is obtained; the *pilnet* drills a hole in the *tamnet*, and the heated wood-dust thus produced falls on to a knife-blade which is placed underneath. When sufficient heat is obtained it is laid on a small bundle of tinder (*sorgut* (dry grass) or fibre of the *pesiwet*[3] tree), and blown till the tinder kindles.

MODERN HUNTERS.

6:Huntingford E-5 (1938-1939) 1953 FL6 Dorobo FL6

313 *Rerendet* (euphorbia candelabrum) : honey-barrels.
824 *Moost* : honey-barrels.
Olkewiyoit or *Yemdit* (olive, olea chrysophylla) : fire-wood.
Enyassiek : fire-wood.
Corost (ficus sp.) : fire-sticks.
Test (cedar, juniperus procera) : fire-sticks.

824 (B) Plant material. The following trees and plants provide material for food, salt, medicines, and utensils[*] :

● [372] *Sasiat* (dry grass) : tinder for making fire with fire-sticks.
[285] † *Tapariet* : fibre for baskets.
[270] *Sosiot* (phoenix reclinata palm) : fibre for baskets.
† *Tiinet* : medicine.
† *Opeito* : medicine.
Rerendet : medicine.
Lepuywuret : medicine.
Sitotuet : medicine.
Seketet : medicine.
Usuet (ardisia sp.) : medicine.
[263] *Tepenguet* (acmilia integrifolia) : salt.
Serenguet : salt.
[273] *Rotinuet* or *Rotiet* (kigelia aethiopica) : making honey-wine.

825 (C) Skins and animal products. These include :
237 † Monkey : food ; clothing.
[291] † Antelope : food ; clothing ; bags ; quivers.
[411] Pig-gut : bow-strings.
Feathers : arrows.
† Honey : food ; wine ; ritual purposes.
Ram's fat : ritual purposes.
[583] Goats : bride-payment ; ritual purposes.
Cattle : bride-payment ; milk ; dung ; hides.
[412] Bush-buck : tails for brooms.

285 The basket most commonly made by the Dorobo is the small *kereput*, about 6 inches deep and 6 ½ inches wide at the top. This kind of basket is
[439] used a good deal by the Dorobo themselves, and is also a frequent article
[461] of sale or exchange to the Nandi : *kinapci kereponik Nandi*, "we make baskets for the Nandi", as an old woman said. Dorobo women make baskets when they have nothing particular to do, just as European women knit. The materials used are fibre from the midrib of the *sosiot* palm, which is split into thin strips, and bast from a plant called *tapariet* which is used for sewing the coils of fibre with the aid of a small needle (Fig. 1).[1] The basket maker starts by splitting the *sosiot* fibre, preparing a certain length and biting it off as she

[439] [*] Things marked with a dagger † are used in the preparation of objects given to the Nandi in exchange for their products.

[1] [i.e. see category 116 & 617 - ANALYST.]

9:Hobley G-5 (ca. 1900) 1903 FL6 Dorobo FL6

They are said to be very prolific, having families of eight to ten children, but the infant mortality is so extremely heavy that their numbers increase very slowly: this mortality is probably due to the cold, damp climate of the Mau Forests, which are at an altitude ranging from 7,000 to 9,000 feet.

Their peace ceremony consists of cutting off a dog's ears, and the contracting parties then spatter one another with the blood.

They live principally on Colobus and other monkeys, which they shoot in the forest. At certain seasons, however, they go and hunt big game on the plains, known as the Rangata Nyuki; they wait till the grass is dry, and then burn it to facilitate their hunting. They use poisoned arrows for big game, and unpoisoned ones for monkeys, &c. They train dogs to assist in their hunting, and are very keen to get young dogs for the purpose. They told me that they first gave the dog certain medicine, and the animal could then track game.

They are very clever elephant hunters, and informed me that when they came across an elephant they went off and bathed and scrubbed themselves very carefully to remove all trace of the human scent, and that they were then able to approach a sleeping elephant and spear it with a poisoned dart.

They are most expert in the use of a firestick. The fire is produced in the ordinary way by the friction of one stick upon round vertically in a depression in another piece of wood, which is held firm between the bare feet of the operator; the lower piece of wood appeared to be the juniper of Mau.

A small vocabulary of their language is appended on the opposite page. They use the Nandi numerals.

The prefix "ki," and the suffixes "ai," "it," and "ak," are, I think, brought in from the Nandi language, but most of the roots will be found to be quite distinct. Many of the tribe can only speak Nandi, and when collecting this vocabulary in many cases they appeared to have forgotten the Oggiek or Omotik word but gave the Nandi word, and had to consult among themselves and, as it were, hunt up the proper word. The language is thus evidently dropping into such disuse that it will probably become quite extinct in the near future.

C. W. HOBLEY.

[34]

2: Maguire G-5 (ca. 1926) 1927-28
FL6 Dorobo FL6

Kisigua (if this is so) may indicate nothing more than the fact that their own language has been lost. My remarks are only in the nature of pure surmise, because, as I have said before, I have had no opportunity of conversing with or investigating these people.

This, as far as my information extends, concludes the list of types of people living in, or adjacent to, the Tanganyika Masai Reserve and calling themselves "Dorobo." In the Burungi area of the Kondoa District there are a few impoverished Burungi who live a bush life and who are sometimes referred to as "Dorobo" by their fellow-tribesmen. I imagine that they are the same, relatively speaking, as the *Balaŋga* and have no more real claim to the name Dorobo than have the Burungi themselves.

DOROBO ARMS

(Unless otherwise stated, all native names are in the language of the *Il-Mósiro*.)

The following arms and equipment are commonly carried by the Dorobo in his wanderings through the bush. Many of the articles are in use by the Masai, but with the exception of the sword and throwing-club (which are Masai arms) and the poison (which is manufactured by the Wakamba of Kilosa), the arms are made by the Dorobo themselves. Spears and shields are not used by the true Dorobo, though, as I have said, *Balaŋga* and *Kinyalaŋgat* who have abandoned their wanderings and have returned to the bosom of the tribe may, and often do, carry spears.

The bow (*kuεanda*), which is always kept strung, is anything from four-and-a-half to five-and-a-half feet long. The length varies with the stature of the owner. There is no notch or other arrangement for affixing the string to the shaft—it is merely securely knotted at either end and never seems to slip. The wood used is that of the *Ol-porôwet* tree and is immensely tough and strong. The shaft of the bow is sometimes coloured brown with the stain produced by the spittle made from chewing a leaf the name of which I have been unable to discover, but more often its pristine whiteness gradually fades to a dull brown

2: Maguire G-5 (ca. 1926) 1927-28
FL6 Dorobo FL6

411
[386] through use and continuous contact with hands and bodies which are frequently anointed with *Ol-hâria*.[1]

[337] The bowstring (*inat*) is made from the sinew embedded in the dorsal muscles of an ox, eland, greater kudu or hartebeest. Occasionally it may be manufactured from the tendon of a giraffe's leg.

[415] The quiver (*mootiat*)[2] is a cylinder of ox-, eland- or kudu-skin about two-and-a-half feet in length and capable of containing from fifteen to thirty arrows. A strap runs down one side and is attached to the removable cap. When this cap is put on, the strap, taut over the wearer's shoulder, keeps it in place. The quiver is the same in all respects as that used by the Masai, and an illustration of it will be found on p. 396 of *The Masai; their Language and Folklore* (Hollis).

The arrows (*hâtìk*; sing. *hâte*) vary in length according to the size of the owner. They are generally between twenty and thirty inches long. Many kinds of wood are used for the making of the arrow-shaft (*nnuliandat*). The arrow-head (*sipelda*), which is made from any scraps of iron that can be obtained (since the decline of the *Il-Kunôno*,[3] no iron is smelted in Tanganyika Masailand, and swords and spears are made, almost exclusively, by the Chaga and the Wanguu), consists of a single barb. The hole bored in the shaft to receive it is reinforced with sinew (*Mâisie*) from the leg of an ox. This is bound round the aperture, and then the work is smeared with a kind of gum (*ité*) obtained from the *Ngoisiandat*[4] tree. The arrow feathers are those of the vulture (*Ara'chet*) or the long-legged insect-eating bird called *Endera'hi*. The feathers are bound to the shaft with thin gut and the whole (including the nock) is then coated with a sticky paste obtained by chewing a tuber (*sikôitie*). This paste is smeared on and allowed to dry in the sun, when the result is surprisingly strong and well-knit.

[531] Dorobo arrows are workmanlike and extremely strong, but they are seldom if ever embellished or ornamented in any way.

The arrow-head is generally (when coated with fresh poison)

[1] See note, p. 138 *loc. cit.*

2: Maguire G-5 (ca. 1926) 1927-28
FL6 Dorobo FL6

difficult matter to explain how the *Mósiro* of Talamai penetrated so far south—assuming them to have been Nandi originally. In addition to the other points of resemblance between the *Mósiro* and the Nandi that may have been noted throughout this paper, it may be of interest to state that the *Mósiro* possess and use a four-stringed lyre[1] of much the same shape and construction as that illustrated on p. 39 of Sir Claud Hollis's work on the Nandi. The *Mósiro* are skilful performers on this lyre, which is quite foreign to the Masai. The other Nandi musical instruments (with the exception of the war-horn) are not known to the *Mósiro*, as far as I have been able to discover.

I have said elsewhere that the bulk of the Kenya Dorobo would seem (according to the statements made by the Dorobo from whom the present information has been derived) to be *Aramanik* and *Baiñga*. This was with reference to the Dorobo living among the Kenya Masai and was not intended to include such Dorobo as there may be among the Nandi to-day.

On one occasion I was lured to walk over twenty miles by the promise of being shown some "rock-paintings" alleged to have been made by the *Mósiro* or other Dorobo and to be extremely ancient. My informant assured me that no man could remember the time when they had been done and that the cave in which they were was regarded with great reverence throughout the countryside. I went, only to discover that the place was a disused *Ol-pul* and that the paintings (most of them were of Masai shields, but some were of a character bordering on the lascivious) had obviously been made by Dorobo or Masai Muran within the last five years or so.[2] Some were even fresher. Charcoal, red ochre, lime and wood-ash were the mediums used.

To the casual observer (particularly one new to Africa) the Dorobo, Masai, Kvavi, Gogo and even the Arusha warrior when in panoply might all seem to belong to the same tribe. To the habituated eye there would be many differences readily

[1] *Kipokondet* (Nandi); *Hoombi* (*Mósiro*).

[2] When the Masai Muran go into *Ol-pul*, they are often accompanied by one or more Dorobo, generally *Mósiro*. The duties of the latter are to plait the Masai warriors' hair, cook and make themselves generally useful. Their reward is as much meat as they can consume.

/253 cont./

302 [171] [412] [304] [154] manner as among the Masai, but here the eyebrows are also shaved by both sexes. The nails are cut with an ordinary two-edged knife. The two middle lower incisors are not broken out for everyone. Hair and nail cuttings are thrown away or hidden at some distance from the kraal, so that they will not fall into the hands of an evil sorcerer, who would be able to make from them sorcery leading to a sickness for their former wearer.

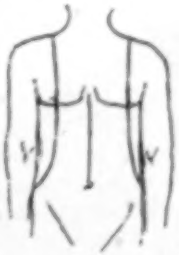

Fig. 87.

302 531 [386] The young men and girls color their entire bodies with a paint made out of fat and red earth (ol garia), or the former also only legs and lower arms, and then wipe off the color again in serpentine lines (lama) that run parallel an inch apart. After killing an elephant [171] the happy hunter paints his chest with three lines, the two outer ones of which go from the collarbone over the nipples to the hips, the middle one from the chest to the navel (Fig. 87), or they paint

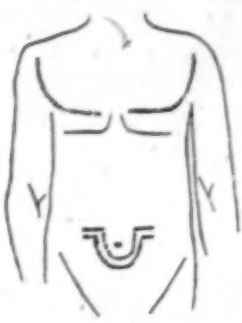

Fig. 88.

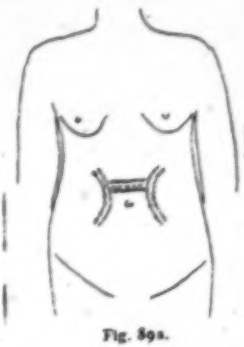

Fig. 89a.

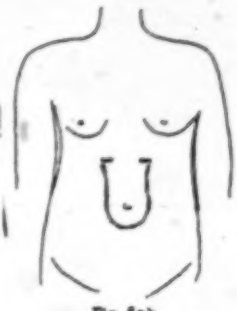

Fig. 89b.

their whole bodies, with the exception of the abdomen, with white and red stripes (like the Masai warriors). The former painting they [192] call katadiridi, the latter they designate with the Masai word en gituñguat. At feasts the men draw a line with the powder ol mogoñgora = root, from the upper lip upward over nose and forehead to the hairline. Boys (Fig. 88) and girls (Fig. 89) tattoo the lyre 304 figure /254/ of the Masai, the latter also another similar one on the 171 abdomen. Not infrequently one also finds on the face of the women [531] the etched-in ol kigerot design, which has been discussed for the Masai.

1:Huntingford E-4, 5 (1938-1939) 1953 FL6 Dorobo FL6

other scavengers. Nowadays, all hunting activities are carried on illegally with the risk of being punished if caught by the police.

Weapons are the bow and poisoned arrows carried in a quiver. Knives are used to skin game and to make springes. Spears have never been used. The Dorobo used to have hunting dogs, but in the North Tindiret Forest the breed seems to have died out, though it existed in 1927. They have two kinds of trap: (i) The pit trap, *ngwet*, formerly used for buffalo, consisting of a pit 8 ft. long, 3 ft. wide, and 6 ft. deep, with wooden spikes set in the bottom. (ii) The springe or snare, *porosat*, which consists, briefly, of a springy stick bent over, with a noose attached to it connected with a platform: the arrangement is such that when an animal treads on the platform its head enters the noose, and the pressure on the platform releases the springy stick, which flies up, tightening the noose, and holding the animal suspended. Such traps can be made in less than ten minutes. This type is used chiefly to catch antelopes, but leopards have been caught in them. Cross-bar traps with a drop-spear were not used by the Kipkurerek Dorobo.

The only hunting taboo recorded is that the night before he goes out hunting a man must abstain from sexual intercourse. This does not apply to the setting of traps.

As regards land rights, the forest was divided into districts, *koret*, pl. *koroosek*, and in his district each man had an hereditary block of land in which he hunted, set traps, kept his honey-barrels, and collected wild food. Occupation rights were recognized by public opinion, and trespass on a man's forest area, *i.e.*, deliberate entry in order to start hunting without permission or the promise of a piece of meat, might result in the trespasser's death at the hands of the owner, who would then have to pay compensation for homicide. Theft of game from a trap is said never to have occurred, not only because the thief might be killed, but because his belly would swell to a great size and he would die after eating meat stolen from a trap.

Bees

Honey is to the Dorobo what milk is to the Nandi: it is "sacred," and its supply must be protected by the observance of taboos. Fruit and blood must not be eaten on the same day as honey (though meat may be eaten); when a comb is emptied, it must be carefully hidden in the undergrowth; and after eating honey a Dorobo cleans his hands in earth, not (like the Nandi) by wiping them with leaves.

The Dorobo recognize four varieties of bee: *sekemik*, the honey-producing kind; *imeiik*, solitary bees which live in trees; *kosomek*, earth bees, which live in the ground; and *kiptulonik*, mason bees, which live in cells made of earth and particles of stone cemented together by their own saliva. The Dorobo divide the honey-bees, *sekemik*, into three kinds: the queen, *kamet ap sekemik*, "the mother of the bees"; the workers, called simply *sekemik*, considered to be males, which make honey by eating the "sap" (*pek*) of flowers and then vomiting it into the empty honey-combs; and the drones, *kapurenik*, considered to be idle females which do nothing useful.

Hives or honey-barrels (*pasanet*) are made either of slats of wood tied together, with circular wooden end-pieces; or of the two halves of a piece of log split longitudinally and tied together. They are set in trees, and when a new hive is put up, the owner calls the bees, in a high-pitched tone, to come and occupy it: "Bees, bees, from all the country, come here now, and pour in honey, pour in honey." Bees are said to recognize their owners by their body-smell, and do not sting them when taking honey. Certainly taking honey does not appear to be a painful or dangerous process to the Dorobo owner. Theft of honey from a barrel is considered very low, and a man might kill a thief, though he would have to pay compensation for homicide.

Honey is an important article in Dorobo economy: it is eaten as food, made into an intoxicant, used for ritual purification, and it forms an article of commerce.

1:Huntingford E-4, 5 (1938-1939) 1953 FL6 Dorobo FL6

412 find lying about on the farms. The only weapon is the bow, *kuyanda*, which the
411 Dorobo make themselves from the *kuviot* tree (*Strebla* sp.); it is about 3 ft. long, and
[439] the bowstring, *iost*, is made from gut of the giant pig, *tumda*. Arrow-shafts are
378 made from the *koromandet* and *mutsila* trees, or from bamboo, *sosiyot*; arrow-
heads are bought from the Nandi, and are of the Nandi patterns. Arrows are carried
in quivers made of hide. Arrow poison is made from the *kelioi* bush (*Acocanthera Schimperi*).

Baskets

415 Making baskets, *kerupet*, is a common occupation of Dorobo women. They are
[462] made from fibre of the *phoenix reclinata* palm, *siniot*, and sewn with bast made from
[124] a plant called *taparuriot*. The technique is a spiral foundation with a flat then
385 gradually ascending coil, of the simple over-sewn type and bee-skep variety, the
stitches being spaced out and not close together.

Miscellaneous

317 Salt used to be made from the ashes of the plant *tepenguot* (*aemilia integrifolia*).
[263] Red and white earth is found near Timboroa on the east of the Dorobo country, and
[439] men go in parties of four or five to dig it, carrying home the earth in large leather
[302] bags, mainly in order to sell it to the Nandi who, in 1930, gave them 2s. a bag.
415 Red earth, *erokoit*, is mixed with fat or simsim oil for rubbing on the hair; white
482 earth, *ewoniot*, has magico-religious uses. For carrying a number of small objects a
1 carrying-net called *lokudet* is used; it is made of a pair of oval rims 3 ft. 6 ins. long
with pieces of liana stretched across them, somewhat resembling a pair of handleless
tennis rackets. These are sometimes used by the Nandi.

Ritual and Beliefs

Religion

776 *Atoita*, the sun, is recognized as a being that can supply or withhold the needs
of people: *Asis, ipiyec panyoh*, "*Asis*, fill us with meat," is a common prayer.
Some say that *Aruna* the moon is his sister, others that she is his mother. Besides
Asis, it is believed that there is a being called *Ilet*, the thunder, who produces rain,
and "the rainbow is his arm which draws up water for him." The Dorobo also
believe in spirits, good and bad, both of which are called *ceuwuloi*, a word which
includes the *oiik* (ancestral spirits) and *menambuasik* (evil spirits) of the Nandi. The
775 ancestral spirits have the same significance and functions as those of the Nandi, and
though they punish the living for doing evil, they are otherwise friendly and visit
the living, travelling in the bodies of snakes, both to see their people and to get food
in the form of *lokomch* (honey and water); spirit-snakes should not be killed.

Divination

760 The Dorobo appear to have no diviners of their own, and when they have
768 recourse to divination, as in cases of illness or witchcraft, they go to Nandi diviners
498 of the type called *sakeyuot*, by whom they are charged a small fee. The people
759 called *orkoiyot* (pl. *orkoik*) among the Dorobo are no more than leeches or physicians
who prepare healing medicines from trees and plants. Although the Dorobo have a
789 reputation among other tribes as powerful rain-makers, they themselves say that they
have no rain-makers, which is probably true.

Death and Burial

764 Very old men and women are buried in narrow holes about 5 ft. deep in which
the bodies are laid full length wearing their clothes; one year after an old man's
death his children plant a branch of *mukupcot* (*dracaena* sp.) on his grave and let it
grow. Other people are laid out for the hyenas, both sexes on the right side with

2: Maguire G-5 (ca. 1926) 1927-28
FL6 Dorobo FL6 .

possibly these Dorobo had been poor Masai, who, having lost their cattle, had taken to hunting, is probably the correct one. It would appear likely that the Dorobo in question were *Balaŋga*, though Sir Claud was unable to satisfy himself as to their true origin.

The original *Balaŋga* are stated to have come from the Kisongo [1] district of the Masai. It may be that this is the case, as the name Kisongo originally stood for a very large tract of country—in fact, almost the whole area occupied to-day by the Masai of Tanganyika Territory. It is certain that there now are *Balaŋga* Dorobo with the Masai throughout the length and breadth of the Tanganyika Masai Reserve, and it becomes more difficult daily to find *Balaŋga* who still devote themselves to hunting. Even those who own little or no stock prefer to live with their richer brethren or with the Masai. The younger men have never led a bush life. They carry spears [2] (and, when appropriate, shields) and do not care to be reminded of the fact that they were ever other than the Masai.

Occasionally, when an elephant or other large beast is killed by the European sportsman, a few old men (Masai, to all outward seeming) will make their appearance unobtrusively, generally accompanied by donkeys. Having obtained permission, they will proceed to rip and hack away huge quantities of the flesh with a determination and cheerful abandon seldom to be met with in the Masai. When the donkeys have been loaded with as much meat as they can carry, the old gentlemen will quietly depart, bound, presumably, for a banquet of Gargantuan proportions. Should one ask, they will admit shyly that they are *Balaŋga*, but will almost always add: "We are now Masai again."

I think there can be no doubt that the Masai and the *Balaŋga* are one and the same. The opinions of the Masai (notoriously unwilling to admit the equality of others) and the *Balaŋga* themselves are unanimous on the matter, and I have been unable to discover any shred of evidence to the contrary. It would appear reasonable to assume that the *Balaŋga* are the

[1] Cf. Hollis: *Masai Language and Folklore*; pp. 260, 261. The name would seem to be restricted, nowadays, to an area south-west and west of Arusha. (Map reference: B 3; Kilimanjaro: E, F, I, K.)

[2] The spear would not seem to be an indigenous Dorobo weapon.

mind) made by placing the forefingers on either side of the nose and calling into the hollow formed by the palms of the joined hands.[1]

The *Méséro* are fast and accurate bowmen at close range, and there are few of them who have not accounted for more than one lion with this weapon. A *Méséroi* at present in my employ is credited with having killed thirteen lions thus, three of them with one arrow. The arrows, of course, are poisoned,[2] and are discharged with a force that would, I feel sure, excite the admiration of a European toxophilite. A curious, crouching attitude is adopted when drawing the bow-string and the archer faces his target, not adopting the more usual position of standing at a right angle to it. The killing of a lion with the bow is not regarded as an event of especial importance and the carcass is often left to rot in its skin.

If trouble is in the wind, the *Méséroi* will always make for the haven he knows best—the bush. There he will live, apparently quite independent of the products of civilisation, and in nowise inconvenienced by a total lack of water, for weeks at a stretch, returning (when the trouble has blown over) with a skin bottle or bag bulging with honey. I could not understand the apparent ability of the *Méséro* to live for long periods in country I knew to be waterless until I had been introduced to what they laughingly said was "the dry-season water." This is an enormous tuber[3] with a skin like the domestic potato. Under the skin is a milky, sticky layer about half-an-inch in thickness. This surrounds the inner core, which is of the appearance and consistency of a raw potato, is slightly fibrous and very moist. When this is chewed (the residue is not generally, but may be, swallowed), it gives great relief to thirst. Squeezing or pounding one of these tubers over a cooking-pot will result in the accumulation of a surprising amount of quite

[1] My predecessor at Kilinya shot two male lions which were "called" to a kill in this way by the *Méséro*. He sat beneath a tree at a place where two lions had recently killed; the *Méséro* mounted the tree and began calling. After a short time, one lion came to the kill (a goat) and was shot. The second lion came quite soon afterwards and was duly given his quietus.

[2] See the section devoted to Dorobo arms.

[3] This tuber, called *Kichorombosa*, is also known to the Kiddu Masai and is called by them *Ol-kiarobosa*. This is a corruption of the *Méséro* name, and the Masai freely admit that they learned of its existence from the Dorobo.

2: Maguire G-5 (ca. 1926) 1927-28
FL6 Dorobo FL6

Kisigua (if this is so) may indicate nothing more than the fact that their own language has been lost. My remarks are only in the nature of pure surmise, because, as I have said before, I have had no opportunity of conversing with or investigating these people.

This, as far as my information extends, concludes the list of types of people living in, or adjacent to, the Tanganyika Masai Reserve and calling themselves "Dorobo." In the Burungi area of the Kondoa District there are a few impoverished Burungi who live a bush life and who are sometimes referred to as "Dorobo" by their fellow-tribesmen. I imagine that they are the same, relatively speaking, as the *Balaka* and have no more real claim to the name Dorobo than have the Burungi themselves.

DOROBO ARMS

(Unless otherwise stated, all native names are in the language of the *Il-Méisi*.)

The following arms and equipment are commonly carried by the Dorobo in his wanderings through the bush. Many of the articles are in use by the Masai, but with the exception of the sword and throwing-club (which are Masai arms) and the poison (which is manufactured by the Wakamba of Kilosa), the arms are made by the Dorobo themselves. Spears and shields are not used by the true Dorobo, though, as I have said, *Balaka* and *Kisyalakai* who have abandoned their wanderings and have returned to the bosom of the tribe may, and often do, carry spears.

The bow (*kasanda*), which is always kept strung, is anything from four-and-a-half to five-and-a-half feet long. The length varies with the stature of the owner. There is no notch or other arrangement for affixing the string to the shaft—it is merely securely knotted at either end and never seems to slip. The wood used is that of the *Ol-pavisai* tree and is immensely tough and strong. The shaft of the bow is sometimes coloured brown with the stain produced by the spittle made from chewing a leaf the name of which I have been unable to discover, but more often its pristine whiteness gradually fades to a dull brown

2: Maguire G-5 (ca. 1926) 1927-28
FLÁ Dorobo FLÁ

411 [384] through use and continuous contact with hands and bodies which are frequently anointed with *Ol-kávia*.[1]

[237] The bowstring (*inor*) is made from the sinew embedded in the dorsal muscles of an ox, eland, greater kudu or hartebeest. Occasionally it may be manufactured from the tendon of a giraffe's leg.

[415] The quiver (*mostiat*)[2] is a cylinder of ox-, eland- or kudu-skin about two-and-a-half feet in length and capable of containing from fifteen to thirty arrows. A strap runs down one side and is attached to the removable cap. When this cap is put on, the strap, taut over the wearer's shoulder, keeps it in place. The quiver is the same in all respects as that used by the Masai, and an illustration of it will be found on p. 356 of *The Masai; their Language and Folklore* (Hollis).

The arrows (*kátik*; sing. *kái*) vary in length according to the size of the owner. They are generally between twenty and thirty inches long. Many kinds of wood are used for the making of the arrow-shaft (*muliandai*). The arrow-head (*nipáki*), which is made from any scraps of iron that can be obtained (since the decline of the *Il-Kwénos*,[3] no iron is smelted in Tanganyika Masailand, and swords and spears are made, almost exclusively, by the Chaga and the Wangusi), consists of a single barb. The hole bored in the shaft to receive it is reinforced with sinew (*Máirái*) from the leg of an ox. This is bound round the aperture, and then the work is smeared with a kind of gum (*ái*) obtained from the *Ngoisiandai*[4] tree. The arrow feathers are those of the vulture (*Aratchai*) or the long-legged insect-eating bird called *Endarúki*. The feathers are bound to the shaft with thin gut and the whole (including the nock) is then coated with a sticky paste obtained by chewing a tuber (*oibáiái*). This paste is smeared on and allowed to dry in the sun, when the result is surprisingly strong and well-knit.

[531] Dorobo arrows are workmanlike and extremely strong, but they are seldom if ever embellished or ornamented in any way.

The arrow-head is generally (when coated with fresh poison)

[1] See note, p. 138 *loc. cit.*
[2] Cf. the Masai *Ol-mótiak*.
[3] See note 1, p. 151.
[4] Cf. the Masai *Ol-ngoswa* (Pedersiana sp.; Hollis). The same tree.

2: Maguire G-5 (ca. 1926) 1927-28
FLA Dorobo FLA

covered with a strip of soft hide—often that of reedbuck or impala—worked to a state of pliability resembling that of chamois leather. The barb is never coated with poison under any circumstance.

A small supply of fresh poison (*sqweswa*) is sometimes carried in the heel of the quiver. This poison is a black, sticky mass made by boiling the leaves of a certain tree and is manufactured exclusively by the Wakamba. The Dorobo know nothing about it, hold it in considerable awe, and have never attempted to make poison of their own.[1]

In the quiver is also carried a fire-stick (*Ol-kiriakyat*) and a fire-block (*sesewda*). The Dorobo are experts at making fire and scorn to use matches. A small flat spoon (*kwesiwandet*) for smearing poison on the arrow-heads is also carried—this spoon is made from the same wood as the bow; and a small knife for smoothing and rounding the arrow-shafts. This knife is called *orwete silidi*.[2] A wooden tube about twelve to eighteen inches long and a quarter of an inch in diameter, not unlike a peashooter, will always be found in a Dorobo quiver. This tube, called *endaire*, is used for drinking from pools which are shallow or which have a dirty, scummy surface. (It is a point of honour with every Dorobo and an unwritten bush law that a man should not stir up the mud in any water at which he drinks.) The *endaire* is also used to induce, by blowing through it, a blaze or clouds of smoke from lighted grass put into a hive to drive the bees away from the honey.

A Dorobo quiver, as we have seen, contains a large number of objects essential to the bush life that the Dorobo leads. It is scarcely to be wondered at, therefore, that it is next to impossible to purchase a furnished one. A Dorobo once told me (I am sure he meant it) that he would not exchange his quiver and its contents for five oxen. The price habitually paid to the parents of a girl taken in marriage is from two to five arrows, and a demand on the parents' part for a full quiver would be regarded as extortionate.

The Dorobo may be seen sometimes with a small axe which

[1] That is, arrow poison. The Dorobo are reputed to have a powerful poison they mix with snuff. When inhaled, it is stated to have a fatal result. I have been unable to obtain a specimen of this poison and doubt its existence.
[2] Literally, "Small knife."

2: Maguire G-5 (ca. 1926) 1927-28
FLÁ Dorobo FLÁ

differs little from that used by the Masai and many Bantu tribes. This axe is, primarily, a tool and not a weapon. They also carry the usual Masai club, which they call *rungu*.[1] This club is used indiscriminately as a throwing or hitting weapon. The Dorobo are excellent shots with it, but are more expert with the bow. The latter weapon they seem to venerate; they are for ever holding archery competitions among themselves, and it is no uncommon sight to see a Dorobo dreamily twanging the taut string of his bow (often little shorter than himself) and deriving obvious pleasure from the sound produced thereby.

A skin bag or bottle, of the usual Masai pattern, is used to bring home honey collected in the bush. The Dorobo carry this, when full (the same remark applies to any other load), by means of a strap of bark or leather round the forehead. The load hangs between the shoulder-blades in the usual Masai fashion.

The *Mōsiro* and *Aramanik* Languages

(A comparative list of numerals, words and tenses, with the equivalents in Masai and Nandi.)

The following symbols or marks have been used to assist in the correct pronunciation of the numerals and the short lists of words and tenses given. They have also been used throughout the text. Most of them are used as in Hollis's well-known works on the Masai and Nandi.

The symbol ~ when superimposed denotes that the *ng* occurring in the word has the same sound as the English *singer*. In cases where it does not appear the *g* is hard.

A diaeresis has its usual grammatical significance.

´ denotes that the letter beneath it is definitely accented.

¯ denotes a long open vowel. *ar* has been used in some words to denote an inimitable, long, drawling sound.

An elevated letter (as in *dalet*) denotes that the letter in question is barely perceptibly sounded.

Where ¯ appears over a vowel, it means that the letter has a

[1] This club is almost always made of the wood of a tree called by the Masai *Ol-oirien*. According to the authority quoted in Hollis, this tree is the wild olive (*Olea chrysophylla*). *Ol-oirien* may also mean the heart-wood of a tree (Hollis).

Hunting.

224 The chief occupation and, in fact, till the last few years, the only occupation of the Dorobo, is hunting (*ngon*: Kony. *kip-ngon-ion* = hunter). They say that at the present day they do not hunt so much as they used to. All kinds of animals were the objects of the chase; the buffalo (*kiptarwit*; N. *seid*), rhinoceros (*kipkemoi*), leopard (*mokilo*, N.); lion (*sendet*; *kpteiado* N.) giant pig (*tomdo*, N.) were among the bigger game hunted. Various kinds of monkeys and antelopes are also sought after, both for their skins and their meat. (See "Food" for a list of the animals eaten by the Dorobo.)

[411] [298] The weapons used in the chase are the bow (*kopelgda*, N.) and arrow (*kkiet*, N.; *ndomatit*, etc.), and spears (*almorondoit*?). Arrows and spears for hunting are poisoned with a concoction made from the koliet tree (N.).[1] Formerly, before the elephant disappeared from the Tinderet region it was hunted and killed with poisoned spears. Small game, besides being shot, are also caught in traps and snares, of which the Dorobo have two kinds; buffalo are also caught in the first kind: (1) Pits (*ngoret*), covered with thin sticks and leaves, with spikes (*kipsenjeiset*) set in the bottom. (2) Snares (*purbet*; N. *mamit*) (Text-fig. 32), which are constructed as follows: a springy stick, A, is stuck in the ground and bent over; to its upper end is fastened a piece of tree-rope, B, which is loosely attached to a looped stick stuck in the ground, supported by three short upright sticks; a little lower down the bent stick A is fastened a noose made from the mkwakyat tree, which is held in place by a cleft stick stuck in the ground on each side; under the noose is made a little platform of sticks, which is covered with leaves. When this platform is touched, since it is in contact with the stick holding the rope B, it releases the rope, and the stick A flies up, thereby tightening the noose.

[231] Dogs (*kpkiin*, pl. *kpkiik*) are used in hunting, and are the only animals kept by the Dorobo who live in the forest. When in the forest they wear leather collars, to which are attached, under the throat, a small bell. The dogs seem to be of a different breed to the ordinary thin-eared cur so common in native reserves, and they are kept in better condition. Their excrement round the huts takes the place of cow-dung in the neighbourhood of a Nandi hut, and makes the air unpleasant.

A description of the weapons is given on p. 346 below.

Food.

869 136 The staple foods of the Dorobo are honey (*kwonet*, N.) and meat (*pungek*, N.). For meat they kill the following animals:—

Antelopes.

Kipkemkut (N. *kimemkipt*).—Blue duiker (*Cephalophus monticola*).
Mimlet (N.).—Red duiker (*C. spadonotus*).

[1] *Acocanthera friesiorum.*

3:Huntingford E-5 (1921-1928)1929 FLA Dorobo FLA

291 301 large discs of brass wire (*kut*, pl. *kutik*), which are hung from the ears by leather straps (*mesilte*; N. *mesin*), to which are frequently fastened one or two cowries (*mdoriok*; N. *mdoruk*) (Text-fig. 18). These ear-rings are, as among the Nandi, the sign of marriage. Girls wear skins (*sbuviet*) or cloth (*sugut*). They have armlets (*kwrik*, N.) and leglets (*sbepukwet*; N. *tepukwet*) of iron-wire, and necklaces of wire or beads (*sniagusi*). The edges of skin garments, both of men and women, are generally trimmed and stitched.

Mutilations of the Body.

304 (a) *Ears.*—In both sexes a small hole (*ongdwrit*; Kony *ingdwrit*) is bored in the top of the ear. This among the Nandi is the tribal mark, and it seems to be so among the Dorobo. Both sexes also pierce the lobes of the ears, and elongate them by inserting cylindrical blocks of wood (*kutik ap titik*, N.), as among the Nandi. [305] Ear-rings are hung from the lobes, which in the case of men are often broken by being caught by branches in the forest.

(b) *Teeth.*—Some Dorobo remove the two middle incisors of the lower jaw, like the Nandi and other tribes; others do not. This is done, they say, "*si ko-kuruna-it pirik*" (in order that people may become beautiful).

(c) *Sexual Organs.*—Circumcision and clitoridectomy are practised. (*See* V, "Circumcision.")

Hair.

302 Men wear their hair moderately long; they put oil and red clay (*ngurut*, N.) on the hair, which sometimes becomes matted, as seen often on Nandi, particularly women. The head is shaved periodically. Boys put red clay and oil on to the shaved head. Both old men and senior warriors wear beards and moustaches, though to no greater extent than the Nandi. In some old men the beard is seen trimmed and pointed. Girls and women shave their heads periodically, and put oil on the shaved heads.

Paint.

Warriors paint their legs with red and white clay, as do the Nandi; they also put red clay on their heads.

Arts and Crafts.

325 [439] The Dorobo have few crafts of their own. They have no knowledge of metallurgy, and there are no smiths; all their ironwork is obtained from the Nandi.

(a) Weapons of Chase and War.

● 411 These consist of bows (*kwgukgda*), arrows (*kitiok*, *kiperuik*, *kipchkponik*, N.; and *ndwanit*); spears (*olmorondoit* or *morondoit*); swords (*usuukto*; or *rotut*, N.); shields (*kulget*, N.); and knives (*chombolwet*, N.). Spears, swords, and shields are obtained from the Nandi.

3:Huntingford E-5 (1921-1928)1929 FLA Dorobo FLA

411 *Bows.*—These are made from the kwoiot (N.) tree, and average 5 ft. 1 in. in length. The string (*laat*, N.), which is made from the entrails of the giant pig (*tumda*, N.), is tied to the bow (Text-fig. 4).

[237]

[439] *Arrows.*—The iron heads (*kipchépet*) are bought from the Nandi, and are usually of the Nandi shapes called chepilolîgiet (Text-fig. 5) and kipchapet (Text-fig. 6) (H.N. Figs. 33, 34). They are from 3½ ins. to 4 ins. long. They are always tanged, and are inserted in a slit made in the arrow-shaft (Text-fig. 9) and bound with fibre or skin binding (*simolto*). The shafts are made of the soosiyat (bamboo), masmita, and kwemamchet trees, and are of an average length of 2 ft. There are three feathers (*kworik*, N.), which are split and trimmed, and fastened to the shaft by a spirally-bound cord (Text-fig. 8). The shaft immediately above the feathers is bound with skin *simolto*; the notch (*susita*) is shouldered, and bound over the shoulder with a skin *simolto*. The length of the feathers is 2 ins. to 2¾ ins. Arrows are kept in a quiver (Text-fig. 10) (*mootiet* N.; *mbolîyôt*) of leather, and about 2 ft. 3½ ins. long, with a leather cap and a sling for carrying it round the body. (For the position assumed by Dorôbo for shooting with the bow, see H.N., Pl. VII.)

412 *Knives.*—The iron blades are bought from the Nandi. They vary in length from 9 ins. to 12 ins., and are about 1½ ins. wide. The handles are about 5 ins. long, of wood, with spiral marks cut in them, and covered with skin, which is pressed into the marks so that they show through the skin. The knives are carried in leather sheaths (*chokot*, N.) which are attached to leather belts (*tapsienet*, N.) (Text-fig. 3).

(*b*) Leather.

281 Skins are dressed and trimmed, and furnish, besides articles of dress and bedding, quivers, sheaths and bags. The ordinary type of bag is called motoket.
415 It is used for various purposes, including carrying honey; for honey-bags, the fur is removed. Bags for carrying other things are made of antelope skin (e.g. *kipsokot*, blue duiker) with the fur left on, and flaps to shut them, which are fastened by a
[482] skin cord tied round the bag (Text-fig. 12). They are slung from the shoulders by a skin cord. Small bags are about 7 ins. by 6½ ins.; others are larger.

(*c*) Baskets (*kereyet*, pl. *kereyonik* (N.)).

285 These are made by the women. They resemble Nandi baskets of the same name.
[462] The upright straws in the baskets are called taparik; the cross straws, sosik (N. = *Phœnix reclinata* palm). The bottoms are flat and are made of skin, which is sewn to the sides. Some have a handle of skin. The average depth of the baskets is 6 ins., width at top 6½ ins. (Text-fig. 21).

(*d*) Miscellaneous.

482 For carrying things in the forest, a contraption called lekwelet (N.) is used (Text-fig. 23). It consists of two oval objects somewhat like tennis-rackets fastened

6:Huntingford E-5 (1938-1939) 1953 F16 Dorobo F16

it himself; but this was regarded as unusual for the case of a married man with a comparatively young wife (his wife Cepkumuren was at that time about 25).

While the sexes within the horde are interdependent, the horde as a whole is dependent on the outside world as represented by the Nandi. Not only do some Dorobo now actually live with Nandi, but they depend on them entirely for all their articles of iron, without which they cannot hunt. Socially, however, symbiosis is increasing. Sometimes unattached old men like Arap Cepsuku, who was about 70 at the time of my visit, live in huts occupied by Nandi: Arap Cepsuku himself was then living with an old woman at Kipkorom, sharing her hut, and growing a little eleusine at one end of her shamba, but merely as a lodger, having no sexual relations with her, for which both were too old. As he was a poor old man, she fed him and looked after him for nothing. This is true symbiosis, as the late Dr. SELIGMAN called it, and the principle is greatly extended by the Dorobo. For, whatever may be the collective attitude of Nandi to Dorobo, and of Dorobo to Nandi, the Dorobo depend on the Nandi for certain essentials, and the Nandi look to the Dorobo for certain things which they can get most easily from them. To the Dorobo, the Nandi, in the shape of the Nandi blacksmith, is indispensable, and the good will of the Nandi people is equally essential if they are to make use of his services.

The Dorobo do not specialize. Every man learns to make all the things he needs for bee-keeping and hunting (except those made of iron); every women learns to make baskets and prepare skins. The raw materials exist close at hand, and may be grouped under 5 heads:

(A) Wood: used for huts, implements, honey-barrels, traps, fuel.
(B) Plant material: used for food, medicine, salt, baskets, and tinder.
(C) Skins and other animal products: used for clothing, bags, roofs, etc.; dung, used to a limited extent for plastering walls.
(D) Earth and stone: coloured earth for painting; granite for grindstones; earth for plastering walls.

(A) Wood. The following trees are used for making weapons, utensils, etc.:

Kuriot (teclea sp.): bows; house-building; honey-barrels.
Masaita: arrow-shafts; firewood.
Koromandet: arrow-shafts.
Sosoiyat (bamboo): arrow-shafts; internodes used as water jars.
Ketuywet: traps.
Kimoluet (vangueria edulis): traps.
Keliot (acocanthera Schimperi): arrow-poison.
Lepekuet (dracaena sp.): house-building; honey-barrels.
Kipseputet (tilia sp.): house-building; honey-barrels.
Maroita: house-building; honey-barrels; fire-wood.
Sasuriet (wild banana, musa ensete): house-building; honey-barrels.
Tenetuet: honey-barrels; fire-wood.
Poroet (liana): traps; honey-barrels; house-building; any purpose for which rope is required.

6:Huntingford E-5 (1938-1939) 1953 FL6 Dorobo FL6

313 *Rerendet* (euphorbia candelabrum) : honey-barrels.
824 *Mocet:* honey-barrels.
Ollamiyoit or *Yemdit* (olive, olea chrysophylla) : fire-wood.
Enyasieh: fire-wood.
Cornet (ficus sp.) : fire-sticks.
Teet (cedar, juniperus procera) : fire-sticks.

824 (B) Plant material. The following trees and plants provide material for food, salt, medicines, and utensils[6] :

[372] *Sasiat* (dry grass) : tinder for making fire with fire-sticks.
[285] † *Tapariet:* fibre for baskets.
[278] *Sosiot* (phoenix reclinata palm) : fibre for baskets.
† *Tiinet:* medicine.
† *Opeito:* medicine.
Rerendet: medicine.
Lepuyuwet: medicine.
Silotnet: medicine.
Seketet: medicine.
Usnet (ardisia sp.) : medicine.
[263] *Tepenguet* (aemilia integrifolia) : salt.
Serenguet: salt.
[273] *Rotinnet* or *Rotiot* (kigelia aethiopica) : making honey-wine.

825 (C) Skins and animal products. These include :

237 † Monkey : food ; clothing.
[291] † Antelope : food ; clothing ; bags ; quivers.
[411] Pig-gut : bow-strings.
Feathers : arrows.
† Honey : food ; wine ; ritual purposes.
Ram's fat : ritual purposes.
[583] Goats : bride-payment ; ritual purposes.
Cattle : bride-payment ; milk ; dung ; hides.
[412] Bush-buck : tails for brooms.

285 The basket most commonly made by the Dorobo is the small *kerepet*, about 6 inches deep and 6 ½ inches wide at the top. This kind of basket is used a good deal by the Dorobo themselves, and is also a frequent article [439] of sale or exchange to the Nandi : *kinapci kereponik Nandi*, "we make baskets [461] for the Nandi", as an old woman said. Dorobo women make baskets when they have nothing particular to do, just as European women knit. The materials used are fibre from the midrib of the *sosiot* palm, which is split into thin strips, and bast from a plant called *tapariet* which is used for sewing the coils of fibre with the aid of a small needle (Fig. 1)[2/1]. The basket maker starts by splitting the *sosiot* fibre, preparing a certain length and biting it off as she

[439] [6] Things marked with a dagger † are used in the preparation of objects given to the Nandi in exchange for their products.

2/1 [i.e. see category 116 & 617 - ANALYST.]

6:Huntingford E-5 (1938-1939) 1953 FL6 Dorobo FL6

224 [805] [221] The year was divided, from the hunting point of view, into the dry season and the wet season. In the wet season people did not generally go out hunting, but stayed at home and set traps to catch antelopes and the like. In the dry season they hunted all sorts of game with bow and arrow in the forest and far afield. Thus, Arap Minio told of how soon after he had been circumcised he was one of a hunting party that went into North Nandi, as far as the hills Kaptepe and Tapsakoi [15] near the modern Turbo, some forty miles from the forest, in the days when there were no Europeans there; and another Dorobo spoke of hunting monkeys as far from home as Kapiyet in North Nandi. Leopard, monkey, and pig are still plentiful. Buffalo still exist to the east, in the direction of Timboroa and Londiani, but they have not been hunted by the Dorobo in recent years, in fact, they say, not since about 1900 when the Kaplelac age were warriors. Elephant are no more, but they were found in this area, according to some old men, when the Sawe and Kipkoimet were warriors about 60 to 70 years ago. There are no lion in the forest, but the Dorobo occasionally shot them in the plains. Leopard used to be hunted by organized parties, but this practice has been discontinued for some years, though they are still attacked and killed by individuals if they get aggressive, as in February 1939, when Arap Singira got his lip torn in a leopard hunt at Sosoiyo. Sometimes traps are made for them, of wire which is picked up on the farms. But trapping leopard is not common, and the trap made by Arap Menati which caught a leopard in July 1938 was said to be exceptional. [231] Generally they prefer to hunt a leopard with dogs, as in the old days, when if one was put up by a dog and climbed a tree, the hunter came and shot it.

[185] There is really no close season, as we understand the expression. The trapping season, which did in fact give the game a respite, was not intended for that purpose, but was for the convenience of the hunters themselves, because when it is wet, the forest is difficult to go through, the undergrowth thick, and the ground muddy and slippery; though some have been known to hunt pig there in wet weather.

●[411] Dorobo hunting equipment consisted of a bow, poisoned arrows, quiver, knife, and dogs. Spears have never been used by the Kipkurerek, and the spear trap reported to be found among some Dorobo does not appear ever to have been one of their methods of killing big game. For trapping, a man needs only something to cut the materials with, and, of course, his skill; if he is to make a pit-trap, he needs something to dig with.

411 [322] [239] Bows are made mainly from the *kuriot* tree (teclea sp.) and are about 5 ft. in length. A suitable piece of wood is cut and scraped with a knife-blade till it is smooth and of the right thickness. The bow-string, *inet*, is made of gut from the giant pig, *tumta;* the gut is stretched, greased and twisted till it becomes sufficiently strong and pliable for use. It is knotted to the ends of the bow an inch or so from each end: no notch is cut in the wood to receive it. Arrow-shafts are made from the *koromandet* and *masaita* trees, as well as from split bamboo; they are smoothed with a knife-blade in the same way as

[103]

[15] Better known to Europeans as Kiboloss and Kapsagol.

6:Huntingford E-5 (1938-1939) 1953 FL6 Dorobo FL6

the bow. Quivers are made of ox-hide. Arrow-poison is made from the bush called *keliot* (acocanthera Schimperi), the use of which the Nandi say was discovered by the Dorobo [16]. It is made in this way: leaves and branches are broken off and boiled in a pot for several hours. The resulting liquid is strained and boiled again till it becomes thick and tar-like. When cool it is placed on a sheet of bark, covered with another piece of bark and put in a tree out of the reach of children, together with the pot in which it was boiled. After making poison a man must purify himself by bathing in a river. *Keliot* poison acts very quickly, but does not make the whole of the animal killed by it unfit to eat. The flesh round the site of entry is cut away and destroyed, and the rest is eaten with safety.

The Dorobo used to have hunting dogs (*sokto*, pl. *sokik*) which at one time were the only animals they kept. They still have dogs, but the hunting breed which I saw in the Kelpui-Kipkorom area in 1927, seems to have died out, for though I saw a few dogs there in 1939, they were nothing more than the ordinary native type, the thin-nosed cur so common in Native Reserves and on farms wherever Africans are found. The original breed, as I saw it in 1927, had, it is true, a tightly curled tail, but was a much better looking animal, of a different shape, and much fiercer, resembling the so-called '*basenji*' dog of the Belgian Congo [17] more than anything else, especially in its prick ears, tail, and carriage, though it could bark. When in the forest, the Dorobo put leather collars on their dogs, with a small bell under the throat so that they could tell where the animals were when they put up game. It was noticeable both in 1927 and 1939 that the Dorobo treated their dogs better than Africans usually do — they paid more attention to them, played with them, and fondled them.

The traps used by the Kipkurerek are of two kinds: the pit-trap, and the springe. The pit-trap, *nguret*, is simply an oblong pit about 6 to 8 ft. long, 3 ft. wide, and 6 ft. deep, dug with digging-sticks, and the earth removed in bags or baskets. Wooden spikes, *kipuaiyeinat*, were often set in the bottom, and the whole was covered with thin sticks concealed by a layer of grass and leaves. The trap was dug across a path known to be used by buffalo, the animal it was chiefly intended to catch. This type is no longer used. The springe is the only trap used to-day. It is called *poroet*, and can be made in a very short time by almost any Dorobo. It is used chiefly to catch smaller game like antelope. The materials required to make a springe are wood, liana, and grass, and the only tool used is an axe or *panga* (the long-bladed knife or cutlass common in Africa, and now often used by Dorobo). The trap about to be described was made for me on the edge of the forest at Kipkorom by Coimin arap Katam on 9 July 1938. It took him about 12 minutes from start to finish, and did all that was claimed for it; it should be noted that he was somewhat out of practice, and probably took a little longer than a man who was constantly making traps.

7: Wayland N-5 (ca. 1926) 1931 FL6 Dorobo FL6

241 beer called *sees* is brewed from *ripp*. Planting is done in a season called *Loukwung*, when there A form of
[273] are, or should be, light rains. This is well recognized, as are two other seasons or months:
[132] *Lovara*, a time of rain; and *Loichetto*, a time of much rain.

805 *The Calendar.*—The Wanderobo are very hazy about the calendar, and disagree among themselves about it. The "year" appears to be divided into six months, of which the following lists were compiled from those who pretend to know about them. No two agree, it will be noticed, except 3 and 4, which are probably wrong, for my informants displayed much uncertainty.

1.	2.	3.	4.	5.
Ladunga.	*Loukwung.*	*Ladunga.*	*Ladunga.*	*Loukwung.*
Lumuka.	*Ladunga.*	*Loukwung.*	*Loukwung.*	*Lovara.*
Lukwa.	*Loumuk.*	*Loumuk.*	*Loumuk.*	*Loicheto.*
Lovara.	*Loicheto.*	*Loicheto.*	*Loicheto.*	*Loudunga.*
?	*Lovara.*	*Lovara.*	*Lovara.*	?
?	?			

262 *Food.*—In addition to the above-mentioned grain the Wanderobo will eat almost anything they can get their teeth into, but I do not gather that they will eat human flesh. They will devour any kind of antelope or pig, elephant, rhinoceros, etc., also carnivores of all kinds, except the hyæna; nor do they eat chicken (the Dodotho say that this is because they—the Wanderobo—do not possess any) or snakes. Honey is greatly prized, and bee-traps are set
[222] far and wide in the trees.

462 *Division of Labour.*—A man's work, except during the hunting season, is wood cutting and attendance on the crops, where his main function is that of a scarecrow. During the hunting season all the able-bodied men leave the village in search of game, which they spear and trap. On wet ground they will actually run down a buck. When the hunters are out, work in the fields and village is done by women, children, and old men. The boys help with the crops, and the girls are employed in the village grinding grain and fetching water with the women. The very old people sit about and take little active part in the life of the community.

517 *Recreations.*—The Wanderobo have no musical instruments. They rarely dance, and while the children doubtless play games I gathered no reliable information under this head.

439 *Manufactures.*—The Wanderobo are peculiarly wanting in this respect. They make neither
[285] baskets nor pottery. The former I did not see among them (the people were found to be using
[323] gourds as cooking pots). The latter is obtained from the Dodotho in exchange for tobacco.
[415] Their shields (*kesen*) are similarly obtained, while their spears (*biss*) come from the Dodinga
[411] country, just over the border in the Sudan. It is noticeable that they use the short stabbing
[352] spear. These, it may be noted, are the only tanged spears I saw in Karamoja. They use headrests (*sekicholung*) of Dodotho origin; as with all other tribes in this part of the world,
[531] they carry their water in gourds, upon which they frequently carve crude designs.

/54 cont'd/

in the dense forests of Kenia and Kikuyu, the forest-clad escarpment of Mau, the top of Elgeyo, Maraqwet, Chibcharagnani, Buru, Dondote etc. They are rarely found in numbers and usually in very small villages, so that there is nothing like tribal /55/ life among them. They enjoy considerable immunity from attack by the Masai, as they are sources of wealth to the latter by attracting the coast traders; usually, too, the Masai fall heir to a considerable share of the ivory. They also act as go-betweens or middlemen in getting the married people the vegetable food they require. To such an extent is this system carried, that on the plateau to the east of Naivasha at the place called by the traders Mianzi-ni, a very large village of Andorobbo have altogether given up hunting, and subsist entirely by buying vegetable food from the Wa-kikuyu and selling it again to the Masai or it may be the traders.

131 361 439 [648]

"The language spoken by the Andorobo is allied to that of the Masai, but they can all speak the latter in its purity. They build regular villages, and in general appearance they resemble the inferior class of Masai. As I have already remarked, they make the buffalo-hide shields of the warriors as well as the coarse earthen cooking-pots of the women. They are on the whole looked upon as a species of serf, and treated accordingly. Their transactions with the traders must be done secretly, or everything would be stolen from them."

197 361 144 411 415 439

Mr. C.W. Hobley, in the glossary to his Bantu Beliefs and Magic, says:

101

"Dorobo in Masai means tsetse fly. The name for an aboriginal race of hunters who inhabit the great forests of the highlands in East Africa. They call themselves Asi and the Kikuyu call them Adzi. The name of the Athi River is believed to be a corruption of Adzi."

9:Hobley G-5 (ca. 1900) 1903 FL6 Dorobo FL6

They are said to be very prolific, having families of eight to ten children, but the infant mortality is so extremely heavy that their numbers increase very slowly; this mortality is probably due to the cold, damp climate of the Mau Forests, which are at an altitude ranging from 7,000 to 9,000 feet.

Their peace ceremony consists of cutting off a dog's ears, and the contracting parties then spatter one another with the blood.

They live principally on Colobus and other monkeys, which they shoot in the forest. At certain seasons, however, they go and hunt big game on the plains, known as the Rangata Nyuki; they wait till the grass is dry, and then burn it to facilitate their hunting. They use poisoned arrows for big game, and unpoisoned ones for monkeys, &c. They train dogs to assist in their hunting, and are very keen to get young dogs for the purpose. They told me that they first gave the dog certain medicine, and the animal could then track game.

They are very clever elephant hunters, and informed me that when they came across an elephant they went off and bathed and scrubbed themselves very carefully to remove all trace of the human scent, and that they were then able to approach a sleeping elephant and spear it with a poisoned dart.

They are most expert in the use of a firestick. The fire is produced in the ordinary way by the friction of one stick spun round vertically in a depression in another piece of wood, which is held firm between the bare feet of the operator; the lower piece of wood appeared to be the juniper of Mau.

A small vocabulary of their language is appended on the opposite page. They use the Nandi numerals.

The prefix "ki," and the suffixes "et," "it," and "ek," are, I think, brought in from the Nandi language, but most of the roots will be found to be quite distinct. Many of the tribe can only speak Nandi, and when collecting this vocabulary in many cases they appeared to have forgotten the Oggiek or Omotik word but gave the Nandi word, and had to consult among themselves and, as it were, hunt up the proper word. The language is thus evidently dropping into such disuse that it will probably become quite extinct in the near future.

C. W. HOBLEY.

Some Dorobo Beliefs. *By A. C. Hollis.*

I recently went for a trip through the little known country lying between Naivasha and the Anglo-German frontier, and was fortunate enough to obtain a snapshot of a Dorobo, who was a member of the caravan, spitting towards the rising sun before saying his morning prayer (Pl. M, Fig. 1). Whilst performing this ceremony he had to lay aside his sword.

[827] [821] [982] [911] 789 [911] [996]

The rains were overdue at the time, and I took photographs of the same Dorobo making medicine to prevent the rain from falling. Fig. 2 shows him whistling at and defying the rain-god. In Fig. 3 he has laid aside his bow, and whilst holding his sword upright is rubbing the handle rapidly between his two hands. This is done when the rain-god takes no notice of his defiant remarks, and insists on turning on the celestial water-tap. It is doubtless only a remarkable coincidence, but although the rain oftened threatened we had very little till we returned to the Uganda Railway, when it came down in torrents. All the natives of the caravan—Kikuyu, Kavirondo, and other East African tribes—believed that the Dorobo had kept off the rain, and I was told more than once that if it had not been for him we should have been washed away.

197 It is worthy of note that I met some Masai-Dorobo in the Rift Valley who did not speak Nandi like most of the Dorobo in both British and German East Africa. Whether their ancestors had never known this language or had forgotten it owing to long intercourse with the Masai, or whether they had been simply poor Masai, who, owing to the loss of their cattle, had become outcasts and taken to hunting, I was unable to ascertain.

A. C. HOLLIS.

[P 177]

and by personal ability, and therefore to some extent by their geographical setting. They have no iron ore, no metallurgic knowledge, and so all ironwork is imported from the Nandi. Tobacco, which they like, is not grown as yet, and this too must be obtained from the Nandi. There is a regular exchange of honey, skins, and baskets, for arrowheads, knives, tobacco, seeds, pottery, etc., and a scale of exchange values has come into existence:

1 arrow head is given for a gourd of honey.
1 bundle of tobacco is given for a bag of honey.
1 large pot is given for a large bushbuck skin.
1 small pot is given for a duiker skin.
2 basketfuls of seed for one basket.[1]

Sometimes personal services are given, e.g. a day's weeding in the smith's garden for two knives.

Cattle are obtained from the Nandi, to a limited extent, by a system of gift exchange for furs. The Nandi make friends with the Dorobo chiefly for the purpose of getting honey, and the Dorobo will give some to his Nandi friend without expectation of an immediate return. Presently the Nandi gives the Dorobo a goat, and this exchange of gifts paves the way for further and more important transactions: eventually the Dorobo offers his friend a fur cloak for an ox, as e.g. my friend Arap Minig acquired one from a Nandi called Kapkile at Ollesos; he also got another in exchange for 7 goats, which he bought out of his wages for working on a farm.

C. Techniques

1. Hunting

The dry weather, *muainonik*, is the shooting season, and the wet weather, *iwot*, is the time for trapping. The weapon is the bow and arrow (spears are not used by the Kapchepkendi Dorobo), and the hunters use dogs.

In wet weather buck are caught in traps. In the dry season, wild pig of various kinds[2] were

[1] A honey-bag is about 12 ins. deep, and 8 ins. wide; it contains about twice as much honey as a gourd. A basket (kerepet) is about 6 ins. deep and 6½ ins. wide at the top.

[2] *Tumda*, the wart-hog (Phacochoerus aethiopicus); and *Torast*, the giant hog or bush-pig (Hylochoerus Meinertzhageni).

M 563 D 224 Before closing this chapter it may not be out of place to say a few words regarding a tribe of people whom I have referred to as the Andorobbo. This tribe—the Wa-ndorobbo of the Wa-swahili—is a small race of people scattered over Masai-land, who gain their entire livelihood by the chase. They neither keep cattle nor cultivate the land. The antelope, the buffalo, and the elephant supply them with such meat as they may desire, while they always find neighbouring tribes, less skilful in hunting, eager to exchange vegetable food for game. The elephant, however, seems to be their staple food, and as a rule the Andoroddo are to be found only where those animals abound; as, for instance, in the dense forests of Kenia and Kikuyu, the forest-clad escarpment of Maũ, the top of Elgeyo, Maragwet, Chibcharagnani, Buru, Dondolè, &c. They are rarely found in numbers, and usually in very small villages, so that there is nothing like tribal life among them. They enjoy considerable immunity from attack by the Masai, as they are sources of wealth to the latter by attracting the coast traders; usually, too, the Masai fall heir to a considerable share of the ivory. They also act as go-betweens or middlemen in getting the married people the vegetable food they require. To such an extent is this system carried, that on the plateau to the east of Naivasha, at the place called by the traders Mianzi-ni, a very large village of Andorobbo have altogether given up hunting, and subsist entirely by buying vegetable food from the Wa-kikuyu and selling it again to the Masai, or it may be the traders.

D [131] [361] M 563 D 439

M 563 D 192 105 The language spoken by the Andorobbo is allied to that of the Masai, but they can all speak the latter in its purity. They build regular villages, and in general appearance they resemble the inferior class of the Masai. As I have already remarked, they make the buffalo-hide shields of the warriors, as well as the coarse earthen cooking-pots of the women. They are on the whole looked upon as a species of serf, and treated accordingly. Their transactions with the traders must be done secretly, or everything would be stolen from them.

D 224 411 In hunting the elephant the Andorobbo use a peculiar weapon. In shape it is like the rammer of a cannon, the heavy head being intended to give additional weight in dealing a blow. In the thickened part is placed a weapon like a short but thick arrow, fifteen inches long, the head of the arrow being smeared over with the deadly poison of the *murju*. The whole spear is little short of eight feet. With this the

6:Thomson K-3 (1883-1884)1887
FL12 Masai FL12
Wa-kwafi
Dorobo FL6

elephant is attacked at close quarters, the arrow part driven into the great brute, and being loosely fixed in the handle, it remains when the latter is withdrawn. Another arrow is then affixed, and the same operation performed. It is said that an elephant will live a very short time after being thus stabbed, and entire herds are killed without one escaping, so dexterous and daring are these hunters. The Andorobbo also use the ordinary bow and arrow, but only for the smaller game.

D 224 411

CHAPTER XI.

THROUGH KAVIRONDO TO VICTORIA NYANZA.

THE people (Wa-kwafi) of Njemps presented an interesting study to the observer as throwing light upon the origin of the various small tribes which people Africa. Unquestionably Masai in race, and only separated from that tribe through the loss of their cattle and the consequent necessity of breaking their cherished convictions by cultivating the soil, they had developed new ideas, manners, and customs in a comparatively short period.

M 101 184

They did not by any means supply an argument in favour of the vegetarians; for in personal appearance they had distinctly degenerated, and could not for a moment compete with their aristocratic carnivorous brethren of Lykipia. This was especially noticeable among the women, who had lost their slender, *genteel* shape and acquired the ill-proportioned, unwieldy contour of the negress. Perhaps an exception might be made in favour of the young women, many of whom were well-formed and characterized by most pleasing and interesting manners.

M 142 184

The colony consisted of two villages—Njemps of Guaso Tigirish, close to our camp, and Njemps of Guaso na Nyuki. The houses were of the haycock order, with floors beneath the level of the ground, very small and badly built. They were surrounded by a double fence of thorns, which, however, are a greater source of danger than of protection, as in this dry climate they become like tinder, and consequently can be set on fire easily. If this were done at several points simultaneously, the inhabitants could easily be burned to death.

M 361 M 342 351

In a hazy sort of way they tried to keep up the distinction

M 184

/229 cont./

184 The fact that in many things the Asá served as a model for the latter two and that the El aaiti also often designate themselves as Asá follows [224] from the circumstances. They are both merely /230/ hunters, whereas [233] among the El gaaurek the tendency toward animal husbandry has still been preserved here and there.

128 In the following, for obvious reasons, only the Asá will be discussed.
197 Therefore the accompanying native words have been taken from the Asá idiom.

613 The fact that the Asá are divided into the same tribes and lineages
614 as the Masai and Wakuafi and that they also regard the oi oiboni[1] as
89 their chief has already been mentioned at the beginning. It is to be

1. [i.e., the chief of the Masai people--Analyst]

/235 cont./

231 Then a man climbs up to the beehive, fastens it to a rope, unhooks it, and very slowly lowers it to the ground, so that through the continuing effect of the smoke the bees will also be driven out of the combs or stupefied in them. It is obvious that through this the honey must become very dirty, and, in fact, it tastes strongly of smoke and contains a large number of dead bees and larvae. No other method of driving the bees out is possible, however, and since they are extremely vicious and the people, only scantily clad, expose such large areas for their stings, the honey gatherers have to be enveloped in a thick cloud of smoke for their own protection. I was able to observe the viciousness of the native bees several times. It is by no means rare that a swarm will attack a caravan and sting some of the porters and donkeys into unconsciousness, the latter even to death. Tobacco smoke in particular incites them to attack, but they also seem to dislike loud singing and shouting.

In extracting the honey, one leaves about a quarter of it in each [261] comb so that the bees will not abandon the hive. The extracted honey [415] is packed into leather bags or wooden pots and thus stored. The capture of wild bees is unknown. Where such are found in a hollow [136] tree, one hangs in the vicinity an empty beehive that has previously been smeared on the inside with the extraordinarily aromatic honey of a Melipona species (subspecies Trigona) (2)

2. Identified by Herr Dr. Enderlein from samples sent to the Museum für Naturkunde /Museum of Natural Science/, Berlin.

222 known as el mafh. In order to be able to extract the honey of wild bees from hollow trees, one drives them out by holding aloft a burning branch with which one climbs to the hole.

• 411 322 [46] [462] In the camp one sees the men either squatting about dully or busy with carving, such as the beehives just mentioned, or with making bows, arrows, and clubs. The stick intended for the making of a bow (Fig. 87) (from the el boengei tree) is rounded, cut tapering at both ends, and then scraped smooth. After it has been rubbed

/336 cont./

411 322 [323] [297] with fat several times. It is heat over the fire. The sting is plaited together, coming and braidlike, out of short animal tendons and is extended by further interweaving up to the required length. The projecting starting-ends of the individual pieces of tendon are neatly cut off, whereupon one then rubs the now finished bowstring with some fat.

[297] [324] [412] The arrow shaft (Fig. 84) is carved out of a dry wooden stick, first rounded, then smoothed by scraping. The upper end is wound with tendons that have been coated with the vanishlike juice of a not yet described species of gladiolus known as dirrit, whereupon, on top, one drills in the one- /336/ /Figs. 83 and 84 appear here/ 411 centimeter-long hole for the tang of the arrow by a twirling motion [237] with a thin wooden chisel. At the lower end the three-part feather- [136] [323] ing -- out of the feathers of the carrion vulture (Neophron percnopterus) -- is first fastened on by being wrapped with a very fine [324] bast thread and then glued fast with the gladiolus juice just mentioned. Another wrapping of animal tendons is found between the feathering and the rear notch for the bowstring, in order to prevent a splitting of the shaft.

[325] [322] [171] [439] The people buy the iron points only if a point breaks off /337/ do they as a rule forge a new one for themselves. Clubs are carved from a piece of wood, as among the Masai. They buy the spears, of which there are one or more in almost every camp, from the blacksmiths of the Masai. The spears serve as weapons only in the camp, where shooting with arrows is not permitted, on account of the danger connected with that, since they are always poisoned.

415 [434] [285] The Axe for the most part buy wooden bowls and gourd bottles from sedentary tribes. On the other hand, in some places they plait shallow baskets, which they use for storing food.

524 [324] 171 The fact that the Wandorobo do not play the board game so popular among the Masai was explained to me by them with the words "During the game we would forget to hunt and then, with our families, would have to starve."

512 517 With the coming of darkness complete stillness as a rule comes over the camps, quiet even during the day: the day's work is done and everyone goes to his hut. Only on moonlit evenings do the old [273] people often still sit in the open for a few hours, talking, with a [535] gourd bottle of honey beer, while the young men and girls dance [533] and let their falsetto song ring out through the still night. Soon

elephants, buffalo, and lions, has distinguished himself through
courage and decisiveness and who shows these qualities anew again
and again is elected knight.

About the circumcision of the girls, it is only to be said that, adorned, a few days before the operation they set out for the neighboring camps to bid farewell to their younger girl friends. On these visits they are permitted to appropriate anything that they wish (food, clothing, ornaments, etc.), without special permission from the owners.

Concerning the reason for the circumcision the Asá also say that God commanded them to undertake this on their children.

/345/ VIII.

Hunting. -- The weapons, bow, arrow, hunting spear. -- Owner-ship marks. -- Preparation and effect of the arrow poison. -- Treatment of arrow wounds. -- Stalking. -- Hunting dogs. -- Ration. -- Battue hunting. -- Practice of hunting. -- Game. -- Superstition. -- Minor means of the hunters in the bush.

For the Ándorobo hunting is what war is for the Il máasai of the Masai. Their principal weapons are bow and arrow. The two-sided bow ([Fig. 88] gari, gaiowag) has the shape of a flattened segment of a circle. It is as a rule 1.50 meters long and very sharply flexible. With it belongs a leather quiver ([Fig. 88] ngátik, nadimarig) with arrows ([Fig. 84] mat, mara). The wooden arrow-shaft bears a small notch on its rear end for setting it on the bow string, and directly in front of it the three-part feathering (kalya). The iron point, which the Wandorobo usually buy from Wakuafi and Masai blacksmiths, but also from sedentary Negroes, and more

/345 cont./

411 [439] rarely also make themselves, as a rule has the so-called arrow shape. It bears either a short, flat tang, which is lengthened by insertion into a cylindrical one ten centimeters long, or else the latter and the point are worked continuously out of one piece. Now and then one also finds arrows among which the extension tang is made out of wood. These come from Ukambe, where the Wandorobo, who call them miaré, have bought them. The tang is stuck loosely in the arrow shaft so that the latter can fall off when the animal has been hit. Less frequently they use wooden throwing-spears (Fig. 88) with a loosely inserted, poisoned iron point, which, like the arrow point, remains sticking in the animal hit, while the wooden shaft falls off. They also attack the sleeping rhinoceros and hippopotamus with a sharp sword, which they tie on a stick and use as a thrusting or throwing spear. One leaves this weapon sticking in the wound so that, if the animal flees, it cuts the entrails still more by striking on the ground and against the bushes. Both types of spear are called mmchig. Both the point and tang of arrows and throwing spears bear a filed-in ownership mark (Plates 5 and 6), by which one can recognize tribe and lineage of the owner, in order, upon finding a slain beast of game, to determine its hunter. Like the ownership marks on the cattle and donkeys of the Masai, the symbols here are not the same for all Wandorobo, but vary more or less in the individual

422 directors. Besides such marks one also finds /345/ others that belong to individual large families and are then used in place of the former, not together with them. The point and tang of the arrows and throwing spears are always smeared along their entire length with a plant poison, which the Wandorobo themselves brew out of the wood and roots of the Acocanthera abyssinica, which they call adog, i.e., poison (1).

000

1. Prof. Dr. L. Lewin, Berlin, produced a glycoside, amorphous ouabain, from Acocanthera wood that the author sent to him, which shows the following characteristics: it tastes bitter and is copiously soluble in cold water; Drehung /rotation/ $[\alpha]_D^{20} = -32^\circ$ for a 2 per cent cold dilute solution; it expands at 191°C; it has the per cent composition $C_{30}H_{44}O_{12}$; it is precipitated by cream of tartar; dissolved in concentrated sulphuric acid, it gives a quickly arising and strong fluorescence in green. -- Prof. Dr. E. Stadelmann, Berlin, clinically tested ouabain for serious heart ailments and expressed himself, among other things, about the results as follows: "Ouabain is easily soluble and I took advantage of this circumstance to inject it subcutaneously or intramuscularly. Injected subcutaneously or intramuscularly in a concentration of 0.3-0.4 mg. of ouabain three times daily in the above concentration, I have so far obtained for the most part among my heart patients a very prompt, excellent result in the direction of digitalis, without unpleasant side effects. If the experiences up to now continue to be equally favorable -- and I have no reason to doubt it -- there would

278 /947 cont./
278 arrows, not in the hut, but hung on a tree not far from the camp.
782 Only in rainy weather do they bring the things into the kraal and
834 keep them there in the hut of an old woman who herself, in their
[988] view, can no longer come into consideration in the above respect.
They even make themselves responsible, relative to the intensity of the sexual intercourse, for the slow dying of the animal struck by the poisoned arrow. The poison is smeared on the arrow point
278 with a wooden spatula, and, in order to protect the dried substance
• 411 from crumbling or from dissolving in damp weather (since it is very
294 hygroscopic), it is wrapped with a strip of thin antelope skin that is
[297] dehaired and made soft by being rubbed with fat. The poison acts
[988] very quickly, and, to be sure, by suddenly stopping the heart activity. In the case of a graze shot in the abdomen, breathing difficulty set in after five minutes, along with rapid movements of the nostrils and violent, cramplike muscle twitchings of the body and limbs. With brief interruptions of a quarter to a third of a minute the symptoms were repeated and increased in intensity. The pupils dilated to a circle. Nine minutes and 10 seconds after the shot the pupils, up to then blue-black, suddenly became sea-green, and, with violent twitching, death came. With quite fresh poison death is supposed to come in even a shorter time. In the steppe the poison is tested by shooting an antelope with an arrow newly poisoned. If on the trail of the fleeing animal one finds fresh urine and excrement, the poison is regarded as acting too weakly. Good poison put in the foot of a live turtle must lead to its death before it has crawled five
278 or six steps away. Neither the Asá nor the Wandorobo are acquainted
752 with a physiological antidote. For smaller, simple, and penetrating flesh wounds immediate washing with fresh urine is supposed to help. Aged Wandorobo often showed me scars on their own bodies, especially on arms and legs, which are supposed to have been caused by shots with poisoned arrows two to four centimeters deep. Both the appearance of the scars and the corresponding statements of people, which were separated in time and place from the former, corroborate this information.

/247 cont./

278 415 252 [411] 224 [634] [631] When the cooking of the poison is finished, the pot is cleaned with sand and water and used again for the preparation of food. The arrow point is thoroughly cleaned, heated red-hot, and poisoned anew.

The region in question for hunting has been divided by the El dorobo into definite districts, each of which may be hunted in only the community of its inhabitants. A district, in turn, consists of a number of precincts, whose grassy plains are burned off in a sequence following from their location, the weather conditions, etc. The wild animals then gather to graze on the grass soon freshly sprouting after the burning. This management explains why the hunter is only rarely /248/ forced to return home without booty and why he is able to feed his family continuously and regularly from the yields of his hunting.

The game in general in East Africa is game frequenting the same spot; but the meaning of this statement must be modified in accordance with the relatively enormously large areas here. Just as in Germany a hunter expects a herd of deer at a particular time on a particular knoll, the ol doroboni can quite certainly count on finding the game expected by him at the appropriate time in a region whose diameter amounts to approximately 3-5 kilometers. Considerable disturbances are caused, of course, by the appearance of large predatory animals, [136] especially lions almost always hunting in herds and the hyena dogs always hunting together in larger numbers.

In practicing hunting the men split up in such a way that the younger ones do the stalking on the open steppe, whereas the older ones lie in wait at the watering places of the game. Stalking requires incomparably greater endurance and skill than at home.. The ol doroboni must more accurately watch the wind, since his own strong odor makes it extremely easy for the animal to pick up the scent. He must take the greatest pains to conceal himself from the sight of the animal, since he is unfamiliar with any kind of adaptation to the region and the surroundings, so that his black body stands out clearly, even at great distances, on the usually light yellow steppe. The difficulty of the rush is further increased by the primitive nature of his weapons, which permit him to make an accurate shot only at 20 to 30 meters. In what concerns the patience, perseverence, and dexterity that the Wandorobo show in this, a European hunter can

/259 cont./

789 outside the camp in the steppe, or must leave a slain piece of game /260/ outside during the night, they walk around the spot, before the approach of darkness, with a burning twig of the mondeja bush. They assert that if one has done this, no predatory animal can approach.

789 531 411 224 On the bow end held diagonally upward in shooting, one frequently finds a design like a sentry box, which, in the belief of the people, God himself taught them long ago, and which is supposed to have the effect that in hunting they will kill only fat game.

754 [791] The nature of the sorcery through which sickness and death can be brought about they explain like the Masai. Evil, superterrestrial spirits have nothing to do with it. It is solely the work of evil human beings, who are despised, feared, and therefore expelled; they are called schogoto, in which one recognizes the Masai word ol osokutoni. Persons with the evil eye, who are called gallagumma, are likewise hated and expelled. If one knows no natural cause for an illness or a sudden death, it is regarded as the work of these sorcerers.

XV.

000 Law. -- General remarks. -- Property. -- Sharing the hunting booty. -- Things found. -- Barter. -- Debts. -- Liability. -- Gift. -- Blood friendship. -- Murder and manslaughter. -- Negligent homicide. -- Bodily injury. -- Immoral offenses. -- Theft. -- Inquiry about an unknown culprit. -- Legal procedure. -- Swearing. -- Torture. -- Ordeals. -- Bier test. -- Woman before justice. -- Mentally ill.

671 171 The legal views and legal practices of the Asá in general resemble those of the Masai.[1] We find the same leading ideas everywhere. Here, too, might often comes before right, even if not to the same extent as there.

692 [614] [648] There is nothing new to be said about the rights of families and persons. The sole court in litigation is a respected man chosen by both parties, if plaintiff and defendant belong to the same tribe. Litigation or criminal cases in which plaintiff and defendant belong to two different tribes are not settled by the Wandorobo among themselves, but handed over to the Masai of the nearest kraal for settlement. A prosecution of punishable offenses by legal steps is unknown.

1. [For information on legal views of the Masai, see FL12 Masai, 18:Merker, category 116, pp.279-291--Analyst]

/263 cont./

695 besides the ordeals, the bier test also prevails as a means of convicting the one accused. In contrast to the Masai, here the innocent one accused receives no compensation.

562 694 695 Women may appear as witnesses before the court, but they are not entitled to make a complaint; rather, their husbands make the complaint for them.

672 934 Here, too, the mentally ill occupy an exceptional position in legal matters, /264/ in that they remain unpunished for offenses that are atoned for by fines. They are not chained, but are allowed to go about freely, and, as long as they are harmless, they are given shelter and food. This is denied to the mentally ill who are dangerous, because of which they quickly perish.

XVI.

000 The story of the discovery of arrow poison. -- Other stories and fables.

538 The stories of the Wandorobo describe for the most part their own hunting experiences, especially, of course, those of a peculiar nature and with large, dangerous game. It is probably to be taken for granted that in this "hunter's yarns" also run through them.

The Discovery of Arrow Poison

539 224 278 411 A poor widow, whom no one wanted to take in and feed, roamed steppe and bush daily, in order to appease her hunger miserably with roots, berries, and tree bark. One day she chewed on a small piece of bark that was distinguished by a very bad taste. Soon afterwards vomiting set in so violently that she was sick for a few days. She thought: "I should probably have died if I had eaten any more of it; since I can not hunt game, perhaps I can kill it with this." When she was well again, she went with her pot to the place in the steppe where in a rocky basin there was water to which the wild animals came to drink. Here, for several days in succession, she boiled the wood of the poison bush and kept pouring the liquid into the little pool. Finally one morning she found ten dead buffalo lying in its

/264 cont./

539 224 278 411 vicinity. She ran to the camp in order to fetch men so that they would carry the meat home. When they saw the dead buffalo, they could not understand how it had been possible to kill so many at once. Then the woman told them how she had done it, and now they praised her as the best and cleverest of women and everyone wanted to marry her. After the woman had showed them how to prepare the poison, they made it themselves and smeared their hunting arrows with it.

Some Stories and Fables

539 An ol doroboni shot a giraffe, and since it was evening and he was far from camp, he stayed with the animal during the night. He wanted to stay awake because of the predatory animals that were to be expected, but weariness overcame him. In his dream he saw a lion creeping up. He woke up with a cry of fear. Still half asleep, he took his own leg for the lion and hit it with his knife with all his strength. His campmates, who had set out to look for him, found him with a large wound the next day in the steppe and carried him home.

/265/ An ol doroboni found in the steppe an antelope that he took to be dead. He laid bow and quiver beside the animal and started to skin it. After he had already made two cuts on the belly side, the animal leaped up and ran away with the knife in its body.

A father went hunting every day with his boy. For a long time they were lucky and brought booty home every day. But then there came a time when they did not succeed in killing even a single animal. One day, when they had again stalked in vain, they camped far from their hut in the open steppe. In order to warm themselves, they made a fire. Hunger tormented both of them terribly. Then there came to the old man the idea of killing his son and appeasing his hunger with the corpse. He said to the boy: "Go and fetch firewood so that the fire will be bigger." The boy did as he was told.

1: Huntingford E-4, 5 (1938-1939) 1953 FL6 Dorobo FL6

cide, adultery, and assault. In the first category, incest is punished under the authority of the clan council; the man is beaten, his hut burnt, his honey-barrels destroyed; the woman also is beaten. Witches might be killed under authority of the *koret* council. In cases of persistent disobedience to the council, the elders could call upon two or three men to force the offender, by moral and physical persuasion, to mend his ways. Of offences in the second category, trespass has already been mentioned (p. 58). Theft, when not dealt with summarily, can be brought to the *koret* council, which can order payment of compensation. A man accused of stealing food may say, " If I am a thief, may this grass eat me," and place a blade of grass between his teeth. Adultery might be punished by the injured husband, who, if he killed the offender, had to pay blood-cattle. If a man incapacitates another by assaulting him, he must feed him till he recovers. Homicide of a Dorobo of another clan, though not involving primary sanctions, was a serious offence because it meant that the murderer had to get cattle in order to pay compensation. The usual number was nine head of cattle, though when the murderer was a very poor man living alone the number might be reduced. The kind of cattle (male or female) did not matter. The murderer had to provide as many as he could, from his own herd if he had one, or by exchange from the Nandi, or by any other means, including theft. The deficiency had to be made up by his fellow-clansmen.

Summary

The Dorobo horde consists of a loosely integrated group of districts held together partly by the feeling that they are all Dorobo, but much more by the clan ties which cut across the district boundaries. The clan is therefore one of the chief institutions in the life of the Dorobo.

MAIN CULTURAL FEATURES

CRAFTS

Housing

(*a*) Forest type: the *koconget*, in use as late as 1927, was a framework of sticks bent over to form an oblong, dome-shaped structure, covered on the outside with banana leaves and leaves of trees; height, 6 ft.; length, 11 ft.; width, 7 ft. (*b*) New types: the *keriet* has a circular wall about 5 ft. high plastered with mud, and an almost flat thatched roof supported by a centre post; the *kot* is a hut of ordinary Nandi type, the walls of which are occasionally left unplastered.

Settlements in the forest, consisting of three or four *koconget* huts, were situated in clearings just big enough to hold the huts, and were approached by concealed paths which branched in a bewildering manner that made it impossible to find them without a guide. Settlements outside the forest are arranged in small groups usually close to the cultivated land.

Dress and Ornaments

Clothing is made largely from the skins of wild animals, and the forms are mainly copied from those of the Nandi, as are most of the ornaments, which include, among other things, iron wire armlets and leglets, necklaces, and married women's ear-rings (*taok*). The ear-lobes are pierced and elongated (sometimes getting torn in the forest), and a small hole is bored in the top of the ear. Some but not all remove the two lower middle incisors. Hair is allowed to grow to a length of about 2 ins., when it is sometimes covered with a bladder cap, and sometimes dressed with red earth and fat. Occasionally a man has his hair done in pigtails like the Nandi.

Tools and Weapons

Axes and knives are obtained from Nandi smiths, the Dorobo making the wooden handles. Needles are made from old nails and bits of wire which the Dorobo

1:Huntingford E-4, 5 (1938-1939) 1953 FL6 Dorobo FL6

find lying about on the farms. The only weapon is the bow, *kuyayda*, which the Dorobo make themselves from the *kuriot* tree (*teviea* sp.); it is about 5 ft. long, and the bowstring, *inet*, is made from gut of the giant pig, *tumda*. Arrow-shafts are made from the *koromandet* and *masaita* trees, or from bamboo, *sosoiyat;* arrow-heads are bought from the Nandi, and are of the Nandi patterns. Arrows are carried in quivers made of hide. Arrow poison is made from the *keliot* bush (*acocanthera Schimperi*).

Baskets

Making baskets, *kerepet*, is a common occupation of Dorobo women. They are made from fibre of the *phœnix reclinata* palm, *sosiot*, and sewn with bast made from a plant called *taparaniot*. The technique is a spiral foundation with a flat then gradually ascending coil, of the simple over-sewn type and bee-skep variety, the stitches being spaced out and not close together.

Miscellaneous

Salt used to be made from the ashes of the plant *tepenguet* (*amilia integrifolia*). Red and white earth is found near Timboroa on the east of the Dorobo country, and men go in parties of four or five to dig it, carrying home the earth in large leather bags, mainly in order to sell it to the Nandi who, in 1939, gave them 2s. a bag. Red earth, *erokoit*, is mixed with fat or simsim oil for rubbing on the hair; white earth, *eworiot*, has magico-religious uses. For carrying a number of small objects a carrying-net called *lekuelet* is used; it is made of a pair of oval rims 3 ft. 6 ins. long with pieces of liana stretched across them, somewhat resembling a pair of handleless tennis rackets. These are sometimes used by the Nandi.

Ritual and Beliefs

Religion

Asista, the sun, is recognized as a being that can supply or withhold the needs of people: *Asis, ipiiyec panyek*, "*Asis*, fill us with meat," is a common prayer. Some say that *Arana* the moon is his sister, others that she is his mother. Besides *Asis*, it is believed that there is a being called *Ilet*, the thunder, who produces rain, and "the rainbow is his arm which draws up water for him." The Dorobo also believe in spirits, good and bad, both of which are called *cesowiloi*, a word which includes the *oiik* (ancestral spirits) and *musambuanik* (evil spirits) of the Nandi. The ancestral spirits have the same significance and functions as those of the Nandi, and though they punish the living for doing evil, they are otherwise friendly and visit the living, travelling in the bodies of snakes, both to see their people and to get food in the form of *lokomek* (honey and water); spirit-snakes should not be killed.

Divination

The Dorobo appear to have no diviners of their own, and when they have recourse to divination, as in cases of illness or witchcraft, they go to Nandi diviners of the type called *sakeyuot*, by whom they are charged a small fee. The people called *orkoiyot* (pl. *orkoiik*) among the Dorobo are no more than leeches or physicians who prepare healing medicines from trees and plants. Although the Dorobo have a reputation among other tribes as powerful rain-makers, they themselves say that they have no rain-makers, which is probably true.

Death and Burial

Very old men and women are buried in narrow holes about 5 ft. deep in which the bodies are laid full length wearing their clothes; one year after an old man's death his children plant a branch of *mukupcot* (*dracæna* sp.) on his grave and let it grow. Other people are laid out for the hyenas, both sexes on the right side with

2: Maguire G-5 (ca. 1926) 1927-28
FL6 Dorobo FL6

covered with a strip of soft hide—often that of reedbuck or impala—worked to a state of pliability resembling that of chamois leather. The barb is never coated with poison under any circumstance.

A small supply of fresh poison (*nguano*[1]) is sometimes carried in the heel of the quiver. This poison is a black, sticky mass made by boiling the leaves of a certain tree and is manufactured exclusively by the Wakamba. The Dorobo know nothing about it, hold it in considerable awe, and have never attempted to make poison of their own.[1]

In the quiver is also carried a fire-stick (*Ol-kiriañgeti*) and a fire-block (*sasamda*). The Dorobo are experts at making fire and scorn to use matches. A small flat spoon (*kanuléuandee*) for smearing poison on the arrow-heads is also carried—this spoon is made from the same wood as the bow; and a small knife for smoothing and rounding the arrow-shafts. This knife is called *orueta siléld*.[2] A wooden tube about twelve to eighteen inches long and a quarter of an inch in diameter, not unlike a peashooter, will always be found in a Dorobo quiver. This tube, called *endulee*, is used for drinking from pools which are shallow or which have a dirty, scummy surface. (It is a point of honour with every Dorobo and an unwritten bush law that a man should not stir up the mud in any water at which he drinks.) The *endulee* is also used to induce, by blowing through it, a blaze or clouds of smoke from lighted grass put into a hive to drive the bees away from the honey.

A Dorobo quiver, as we have seen, contains a large number of objects essential to the bush life that the Dorobo leads. It is scarcely to be wondered at, therefore, that it is next to impossible to purchase a furnished one. A Dorobo once told me (I am sure he meant it) that he would not exchange his quiver and its contents for five oxen. The price habitually paid to the parents of a girl taken in marriage is from two to five arrows, and a demand on the parents' part for a full quiver would be regarded as extortionate.

The Dorobo may be seen sometimes with a small axe which

[1] That is, arrow poison. The Dorobo are reputed to have a powerful poison they mix with snuff. When inhaled, it is stated to have a fatal result. I have been unable to obtain a specimen of this poison and doubt its existence.

[2] Literally, "*Small knife.*"

2: Maguire G-5 (ca. 1926) 1927-28
FL6 Dorobo FL6

differs little from that used by the Masai and many Bantu tribes. This axe is, primarily, a tool and not a weapon. They also carry the usual Masai club, which they call *rungu*'.[1] This club is used indiscriminately as a throwing or hitting weapon. The Dorobo are excellent shots with it, but are more expert with the bow. The latter weapon they seem to venerate; they are for ever holding archery competitions among themselves, and it is no uncommon sight to see a Dorobo dreamily twanging the taut string of his bow (often little shorter than himself) and deriving obvious pleasure from the sound produced thereby.

A skin bag or bottle, of the usual Masai pattern, is used to bring home honey collected in the bush. The Dorobo carry this, when full (the same remark applies to any other load), by means of a strap of bark or leather round the forehead. The load hangs between the shoulder-blades in the usual Masai fashion.

THE *MÔSIRO* AND *ARAMANIK* LANGUAGES

(A comparative list of numerals, words and tenses, with the equivalents in Masai and Nandi.)

The following symbols or marks have been used to assist in the correct pronunciation of the numerals and the short lists of words and tenses given. They have also been used throughout the text. Most of them are used as in Hollis's well-known works on the Masai and Nandi.

The symbol ~ when superimposed denotes that the *ñg* occurring in the word has the same sound as the English *singer*. In cases where it does not appear the *g* is hard.

A diaeresis has its usual grammatical significance.

´ denotes that the letter beneath it is definitely accented.

¯ denotes a long open vowel. *ee* has been used in some words to denote an inimitable, long, drawling sound.

An elevated letter (as in *dalo*^{h}) denotes that the letter in question is barely perceptibly sounded.

Where ^ appears over a vowel, it means that the latter has a

[1] This club is almost always made of the wood of a tree called by the Masai *Ol-oirien*. According to the authority quoted in Hollis, this tree is the wild olive (*Olea chrysophylla*). *Ol-oirien* may also mean the heart-wood of a tree (Hollis).

3:Huntingford E-5 (1921-1928)1929 FL6 Dorobo FL6

II.—Mode of Subsistence.

Houses.

342 [361] The Dorōbo live in little shelters or huts (*kochongut*, pl. *kochongeiek*; N. *kwiet*) built in small clearings in the forest; they are made of a framework of sticks stuck in the ground, and bent over, forming a domed roof; the whole is covered on the outside with leaves of trees and banana leaves, which are insufficient, in spite of the addition of an ox-hide on the top, to keep the hut dry inside when it rains. The upright sticks are strengthened by others tied across them with tree-rope. The huts are oblong, with rounded ends, and are of the following average dimensions:—Height, 5 ft. 10 ins.; width, 7 ft. 6 ins.; length, 11 ft. They are occupied for two or three months, after which they become ruinous and "full of fleas," when the family moves to a fresh site. [590] Two to four people live in one hut. One group of huts we saw contained two huts, and had contained a third which had been pulled down. The huts are divided into two parts, the sleeping-place (*itūkto*, N.) and the fire-place, which are separated by two or three poles laid across the floor of the hut, [353] on one side of which are laid ox-hides (*mučnik*; N. *musiuek*), upon which the occupants [513] eat and sleep; at night they cover themselves with skins. In the other half of the hut is the door (*kurket*, N.), about 2 ft. high. Some huts have two doors, opposite [354] each other. Between the door and the sleeping-place is the hearth (*mūt*, N.), consisting of two or three smallish stones set on the floor. A loft (*sainet*, N.) is sometimes made in this part of the hut, extending across the width, and ending at the beginning of the sleeping-place. The loft is about 2 ft. 6 ins. above the floor, and is made of thin sticks supported on thicker cross-sticks, and tied together with [251] tree-rope. Upon it are kept firewood and eleusine grain (Text-figs. 26–28). The [372] only household utensils are a small broom (*wdtutiet*) about 14 ins. long, made of [412] a bush-buck's tail fastened to a thin wooden handle, for sweeping the floor; "water [415] jars" (*soiyet*) made of a hollowed piece of bamboo about 2½ ins. wide and 2 ft. 8 ins. long; a grindstone (*litēto*, N.) made of granite, for sharpening knives, [439] and for grinding eleusine grain. Gourds and earthenware pots are obtained from the Nandi; the Dorōbo have no stools. Fire is produced by means of fire-sticks (*piinet*; N. *piōnet*) (Text-figs. 11*a*, 11*b*). A thin stick of the choruet tree (N.),[1] about 15 ins. long and ½ in. thick, is stood upright on a stick of cedar (*iest*)[2] about 26 ins. long and 1 in. wide. The thin stick is called piinet, the cedar stick tasamet. The piinet is held between the palms of the hands, and the hands are rapidly rubbed together, beginning at the top of the piinet and working downwards (Pl. XXVI, Fig. 2). This is repeated until fire is obtained; the piinet drills a hole in the tasamet, and the heated wood-dust thus produced falls on to a knife-blade which is placed underneath. When sufficient heat is obtained it is laid on a small bundle of tinder (*sasyat* (dry grass) or fibre of the porōwet[3] tree), and blown till the tinder kindles.

3:Huntingford E-5 (1921-1928)1929 FL6 Dorobo FL6

411 [237] *Bows.*—These are made from the kuriot (N.) tree, and average 5 ft. 1 in. in length. The string (*inet*, N.), which is made from the entrails of the giant pig (*tumda*, N.), is tied to the bow (Text-fig. 4).

[239] *Arrows.*—The iron heads (*kipchápet*) are bought from the Nandi, and are usually of the Nandi shapes called chepilofigiot (Text-fig. 5) and kipchapet (Text-fig. 6) (H.N. Figs. 33, 34). They are from 2½ ins. to 4 ins. long. They are always tanged, and are inserted in a slit made in the arrow-shaft (Text-fig. 9) and bound with fibre or skin binding (*simolto*). The shafts are made of the soosiyat (bamboo), massaita, and koromandet trees, and are of an average length of 2 ft. There are three feathers (*kororik*, N.), which are split and trimmed, and fastened to the shaft by a spirally-bound cord (Text-fig. 8). The shaft immediately above the feathers is bound with skin *simolto*; the notch (*suita*) is shouldered, and bound over the shoulder with a skin *simolto*. The length of the feathers is 2 ins. to 2¾ ins. Arrows are kept in a quiver (Text-fig. 10) (*mootiet* N.; *mboñgit*) of leather, and about 2 ft. 3½ ins. long, with a leather cap and a sling for carrying it round the body. (For the position assumed by Dorobo for shooting with the bow, *see* H.N., Pl. VII.)

412 *Knives.*—The iron blades are bought from the Nandi. They vary in length from 9 ins. to 12 ins., and are about 1¼ ins. wide. The handles are about 5 ins. long, of wood, with spiral marks cut in them, and covered with skin, which is pressed into the marks so that they show through the skin. The knives are carried in leather sheaths (*choket*, N.) which are attached to leather belts (*topsienet*, N.) (Text-fig. 3).

(*b*) Leather.

281 Skins are dressed and trimmed, and furnish, besides articles of dress and bedding, quivers, sheaths and bags. The ordinary type of bag is called motoket. 415 It is used for various purposes, including carrying honey; for honey-bags, the fur is removed. Bags for carrying other things are made of antelope skin (e.g. *kipsoket*, blue duiker) with the fur left on, and flaps to shut them, which are fastened by a [482] skin cord tied round the bag (Text-fig. 12). They are slung from the shoulders by a skin cord. Small bags are about 7 ins. by 6½ ins.; others are larger.

(*c*) Baskets (*kereret*, pl. *kereponik* (N.)).

285 [462] These are made by the women. They resemble Nandi baskets of the same name. The upright straws in the baskets are called taparik; the cross straws, sosik (N. = *Phœnix reclinata* palm). The bottoms are flat and are made of skin, which is sewn to the sides. Some have a handle of skin. The average depth of the baskets is 6 ins., width at top 6½ ins. (Text-fig. 21).

(*d*) Miscellaneous.

482 For carrying things in the forest, a contraption called lekwelet (N.) is used (Text-fig. 23). It consists of two oval objects somewhat like tennis-rackets fastened

3:Huntingford E-5 (1921-1928)1929 FL6 Dorobo FL6

together. The rim is made of a single stick bent in an oval and the ends bound together; across it are fastened pieces of tree-rope.[1] Grindstones (*littō*, N.) have already been mentioned.

The Dorôbo have no knowledge of metallurgy, and they have no musical instruments, pottery, or, apparently, objects of ivory. Metal-work and pottery they buy from the Nandi.[2]

Trade and Commerce.

Trade is by barter. The Dorôbo give the Nandi baskets, dressed skins, and bows in exchange for ironwork, tobacco, pottery, beads, and other necessaries which they cannot produce themselves. There are no special market-places, but goods are taken to any place where there are Nandi, and there exchanged.

Land.

(i) *Tenure.*—The forest is divided by the elders into sections, and each family has its own section of forest. The boundaries between family holdings may be paths or rivers.

(ii) *Geographical Divisions.*—The Dorôbo divide their country into divisions called *koret*, pl. *koroseek* (N.). The chief divisions appear to be called Kipkorom, Sirua, Kimurienge, Sosoiyo (bamboo, N. *tekut*), and Mokopich. The majority of the present place-names are Nandi.

The points of the compass are called as follows:—North and South: Murot (N.). East: Ye-torur (N. *ulin-durur* = up). West: Ye-'rek-to (= where(-the-sun)-descends-thither).

III.—Government.

The Kâmelilo-Kâpchepkendi Dorôbo have now no chief. The last to hold office was Parîgetuny[3] arap Ñgamîgam, who was chief at the time of the Nandi Punitive Expedition, 1905. He is still alive, though he no longer holds office. The chief was elected, and the office was not hereditary. The chief (*kiruogindet* (N.)=councillor) was chosen for "ligelyepta kitio" ("tongue only" = sense, ability and position). The only form of Government that exists now is a council of elders (*kiruoget ap poiisiek*, N.), who meet and decide on matters which are brought to them. They seem to have little power of enforcing obedience to their decisions, though they claim

[1] This is described and illustrated, although it is a Nandi use, since H.N. does not mention it.

[2] On the use of horns, *see* V, "Miscellaneous." These can hardly be considered as instruments of music.

[3] N. = lion-killer.

6:Huntingford E-5 (1938-1939) 1953 FL6 Dorobo FL6

it himself; but this was regarded as unusual in the case of a married man with a comparatively young wife (his wife Cepkumuren was at that time about 25).

While the sexes within the horde are interdependent, the horde as a whole is dependent on the outside world as represented by the Nandi. Not only do some Dorobo now actually live with Nandi, but they depend on them entirely for all their articles of iron, without which they cannot hunt. Socially, however, symbiosis is increasing. Sometimes unattached old men like Arap Cepsuku, who was about 70 at the time of my visit, live in huts occupied by Nandi: Arap Cepsuku himself was then living with an old woman at Kipkorom, sharing her hut, and growing a little eleusine at one end of her shamba, but merely as a lodger, having no sexual relations with her, for which both were too old. As he was a poor old man, she fed him and looked after him for nothing. This is true symbiosis, as the late Dr. SELIGMAN called it, and the principle is greatly extended by the Dorobo. For, whatever may be the collective attitude of Nandi to Dorobo, and of Dorobo to Nandi, the Dorobo depend on the Nandi for certain essentials, and the Nandi look to the Dorobo for certain things which they can get most easily from them. To the Dorobo, the Nandi, in the shape of the Nandi blacksmith, is indispensable, and the good will of the Nandi people is equally essential if they are to make use of his services.

The Dorobo do not specialize. Every man learns to make all the things he needs for bee-keeping and hunting (except those made of iron); every women learns to make baskets and prepare skins. The raw materials exist close at hand, and may be grouped under 5 heads:

(A) Wood: used for huts, implements, honey-barrels, traps, fuel.
(B) Plant material: used for food, medicine, salt, baskets, and tinder.
(C) Skins and other animal products: used for clothing, bags, roofs, etc.; dung, used to a limited extent for plastering walls.
(D) Earth and stone: coloured earth for painting; granite for grindstones; earth for plastering walls.

(A) Wood. The following trees are used for making weapons, utensils, etc.:

Kuriot (teclea sp.): bows; house-building; honey-barrels.
Masaita: arrow-shafts; firewood.
Koromandet: arrow-shafts.
Sosoiyat (bamboo): arrow-shafts; internodes used as water jars.
Ketuyuwet: traps.
Kimoluet (vangueria edulis): traps.
Keliot (acocanthera Schimperi): arrow-poison.
Lepekuet (dracaena sp.): house-building; honey-barrels.
Kipsepuet (tilia sp.): house-building; honey-barrels.
Marorta: house-building; honey-barrels; fire-wood.
Sasuriet (wild banana, musa ensete): house-building; honey-barrels.
Tenetuet: honey-barrels; fire-wood.
Poroet (liana): traps; honey-barrels; house-building; any purpose for which rope is required.

6:Huntingford E-5 (1938-1939) 1953 FLA Dorobo FLA

313 *Rereshi* (euphorbia candelabrum) : honey-barrels.
824 *Mocet:* honey-barrels.
Olawiyoit or *Yemdit* (olive, olea chrysophylla) : fire-wood.
Enyasiek: fire-wood.
Corust (ficus sp.) : fire-sticks.
Tost (cedar, juniperus procera) : fire-sticks.

824 (B) Plant material. The following trees and plants provide material for food, salt, medicines, and utensils*:

[372] *Sasiat* (dry grass) : tinder for making fire with fire-sticks.
285 † *Taparariet:* fibre for baskets.
[278] *Sosiot* (phoenix reclinata palm) : fibre for baskets.
† *Tiinet:* medicine.
† *Opeito:* medicine.
Rerendet: medicine.
Lepuywet: medicine.
Situturt: medicine.
Sekutet: medicine.
Usuet (ardisia sp.) : medicine.
[263] *Tepenguet* (acmilia integrifolia) : salt.
Serenguet: salt.
[273] *Rutinuet* or *Rutiet* (kigelia aethiopica) : making honey-wine.

825 (C) Skins and animal products. These include:

237 † Monkey : food ; clothing.
[291] † Antelope : food ; clothing ; bags ; quivers.
[411] Pig-gut : bow-strings.
Feathers : arrows.
† Honey : food ; wine ; ritual purposes.
Ram's fat : ritual purposes.
[583] Goats : bride-payment ; ritual purposes.
Cattle : bride-payment ; milk ; dung ; hides.
[412] Bush-buck : tails for brooms.

285 The basket most commonly made by the Dorobo is the small *kewpet*, about 6 inches deep and 6 ½ inches wide at the top. This kind of basket is used a good deal by the Dorobo themselves, and is also a frequent article of sale or exchange to the Nandi : *kinapei kereponik Nandi*, "we make baskets for the Nandi", as an old woman said. Dorobo women make baskets when they [439] [461] have nothing particular to do, just as European women knit. The materials used are fibre from the midrib of the *sosiot* palm, which is split into thin strips, and bast from a plant called *taparariet* which is used for sewing the coils of fibre with the aid of a small needle (Fig. 1).[½] The basket maker starts by splitting the *sosiot* fibre, preparing a certain length and biting it off as she

[439] * Things marked with a dagger † are used in the preparation of objects given to the Nandi in exchange for their products.

½ [i.e. see category 116 & 617 - ANALYST.]

Schuntzgford E-5 (1930-1939) 1953 PLA Dorobo PLA

waste it, i.e. as the bone and gets thin, a new end is shaved under the binding; the bast is kept handy in a bundle. The technique is a spiral foundation with a flat, then gradually ascending coil, of the simple over-over type, and bow-shop variety, the stitches being spaced out and not close together. The base of the basket is formed of six fibre coils, sewn together with bast. A hole is made with the needle, and the bast is pushed through it. At frequent intervals the fibre and the bast are moistened with the lips. After the first six coils, a slight rise is made; as each coil makes a complete circle it is slightly raised in order to make the bend between the base and the sides. When a new piece of bast is needed it is shaved right through the hole, leaving about ½ to 1 inch on the other side, and is sewn through as before. The basket maker works with lengths of bast of 6 to 12 inches. The fibre coil is of about the thickness of a pencil, and this must be maintained. When the length of fibre is reduced to about 3 ft. it begins to get thin, and some new strips must be added by shaving off a further length. The structure of the basket is thus, in effect, a continuous coil of compressed fibre, each line of coil tied to the next by stitches of bast. Sometimes the base is made of a circular piece of leather, to which the first coil is sewn, the rest of the procedure being the same as for the all-fibre basket. 325

The dressing of skins, including those used for exchange, is a simple process, for no chemical agent is applied. The newly flayed skin is tightly pegged out on the ground while it is still wet and left to dry in the sun. When dry, it becomes stiff, and in this state it is rubbed with an axe-blade held at an angle of about 20°, the blade being rubbed backwards and forwards till the skin is soft and supple. If it is to be used for a woman's garment or other object in which fur is not needed, both sides are rubbed. Skins are dressed by women. Apart from clothing, the chief objects made of skin are bags, quivers, and parts of tobacco-boxes. The material used for sewing is generally pig-gut. The needle of course has no eye, and the method of sewing is therefore to make a hole with the needle and then push the gut through it. Bags, moreover, are used for many purposes, including the carrying of honey and coloured earth. They are generally made of antelope skin (e. g. blue duiker), and unless intended for honey the fur is left on the outside. They are provided with a flap, a strap for fastening and a sling for carrying them from the shoulder. A common size is 7 ins. by 6 ½ ins., but I have seen them as big as 18 ins. by 16 ins. Tobacco-boxes are made from internodes of bamboo, but they have leather covers at each end, and a thin leather strap is sewn to the covers so that the owner can sling the box round his neck. 331 [265] [266] [267] [268] [269] 405 [325] [276]

The nature of Dorobo life demands exchange of products with the Nandi. The most important of the products they get by exchange is ironwork; other things are pottery, beads, tobacco, cereal seeds, and cattle, and a fairly definite, though possibly fluctuating, scale of exchange values has come into existence. In 1930 some of these values were: 434 436

1 axe for 1 bagful of honey.
1 arrowhead for a gourd full of honey.
2 knives for 1 day's weeding in the blacksmith's shamba.

Lillooet-England R-1 (1938-1939) 1951 FLA Dorothy FLA

that made of hollowed-out logs. A suitable log is cut of such a length as to allow for a length of about 3 ft. 6 in. in the finished article. Trees specially favoured for making honey-barrels are the *mesat* and *ramalal*, on account of the ease with which they can be worked; others used are the *kwatsut*, *xilgwat*, *kyakwat*, *kiyaulpwat*, and *mawuzis*. The entire work of shaping and cutting is done with the axe. The log is first split into two equal halves longitudinally, which are then hollowed out, leaving sides about an inch thick. In the bottom of one half an oblong hole is cut, through which the bees can enter and the owner put his hand to take honey. Four holes are bored in the sides of each half with a red-hot boring-needle (Fig. 1), and when the two halves are put together, lines is threaded through the holes to hold them in place.

The *slat* barrel, not so common as the dug-out because of the difficulty of making the end-pieces, is made of strips or slats of strong bark, the most and *ramalal* trees being favourites for this purpose. The ends are formed of two solid circles of wood which have to be cut laboriously from a log and trimmed to shape. The bark slats are then put in position round the end-pieces and bound together with lines, a sticky piece of *mesh*, as anyone who has had to do a similar job will realize, and to get the barrel into place in the tree also requires great care, since it easily collapses if roughly handled. A hemlock hole is made in the under side, as in the dug-out type (Fig. 1, 2).

Fig. 1. Dug-out Honey-barrel.

When a man puts up a new honey-barrel, he calls out to the bees to come and settle in it [1]. The invocation to bees has a set form, and is uttered in a rather exalted, high-pitched tone:

Xalkan, xalkan, or mel-ne-mentmaura tsilel, ca gaut [2] *anyan, xealalkan,*
Gaa, kan, wha-ne to cosstmen-tlaus-ch, costa-kwa ayu, gaut-te (kwaay),
xealalkan [3].
gaut-te (kwaay).

Bees do not get ill, they say, but are liable to be killed by heavy rain if they are caught in a storm while getting honey. They have also a number

[1] One swarm take off from a bee colony when it becomes congested. Young queens are allowed to develop, and the old queen leads off a swarm to find a new home.

[2] This obscure expression is said to be equivalent to *Gaya ya*, "come here".

[3] The Dentlan have borrowed this formula, and always it is *Gaya xealalkan nemen tsi ne kalus*, "come ye, gnat-ess into the warm tree".

Kilhuntingfund E-5 (1936-1939) 1955 FLA Dorobo FLA

the bow. Quivers are made of ox-hide. Arrow-poison is made from the bush called *kabet* (*acocanthera Schimperi*), the use of which the Kamîl say was discovered by the Dorobo[1]. It is made in this way: leaves and branches are broken off and boiled in a pot for several hours. The resulting liquid is strained and boiled again till it becomes thick and tar-like. When cool it is placed on a sheet of bark, covered with another piece of bark and put in a tree out of the reach of children, together with the pot in which it was boiled. After making poison a man must purify himself by bathing in a river. *Kabet* poison acts very quickly, but does not make the whole of the animal killed by it unfit to eat. The flesh round the site of entry is cut away and destroyed, and the rest is eaten with safety.

The Dorobo used to have hunting dogs (*mdeke*, pl. *mdekik*) which at one time were the only animals they kept. They still have dogs, but the hunting breed which I saw in the Kolpsi-Kipkoreon area in 1927, seems to have died out, for though I saw a few dogs there in 1938, they were nothing more than the ordinary native type, the thin-coated cur so common in Native Reserves and on farms wherever Africans are found. The original breed, as I saw it in 1927, had, as a true, a tightly curled tail, but was a much better looking animal, of a different shape, and much larger, resembling the so-called 'basenji' dog of the Belgian Congo[2] more than anything else, especially in its prick ears, tail, and carriage, though it could bark. When in the forest, the Dorobo put leather collars on their dogs, with a small bell under the throat so that they could tell where the animals were when they put up game. It was noticeable both in 1927 and 1938 that the Dorobo treated their dogs better than Africans usually do — they paid more attention to them, played with them, and fondled them.

The traps used by the Kipkoreon are of two kinds: the pit-trap, and the springe. The pit-trap, *ngoret*, is simply an oblong pit about 6 to 8 ft. long, 3 ft. wide, and 6 ft. deep, dug with digging-sticks, and the earth removed in bags or baskets. Wooden spikes, *kipsoriyoiat*, were often set in the bottom, and the whole was covered with thin sticks concealed by a layer of grass and leaves. The trap was dug across a path known to be used by buffalo, the animal it was chiefly intended to catch. This type is no longer used. The springe is the only trap used to-day. It is called *ginoret*, and can be made in a very short time by almost any Dorobo. It is used chiefly to catch smaller game like antelope. The materials required to make a springe are wood, bone, and grass, and the only tool used is an axe or *panga* (the long-bladed knife or cutlass common in Africa, and now often used by Dorobo). The trap about to be described was made for me on the edge of the forest at Kipkoreon by Cainda arap Kurum on 9 July 1938. It took him about 12 minutes from start to finish, and did all that was claimed for it; it should be noted that he was somewhat out of practice, and probably took a little longer than a man who was constantly making traps.

4:Huntingford E-5 (1938-1939) 1953 FLA Dorobo FLA

241 [221] The planting and reaping periods vary according as the rains are early or late. Between them there is a time when the crops have to be weeded, and after that for two or three months a time when little need be done to the crops but guard them against animal depredations.

The Dorobo grow two main crops, *pik* or *potok*, *eleusine coracana* (commonly known in Kenya as *wimbi*), a short graminaceous plant having a head composed of small grains; and *ejamakok*, maize. Millet had not been adopted by 1939 as a cultivated crop, and when wanted had to be bought [195] from the Nandi. As a subsidiary crop, sweet potatoes, *rukomik*, are grown to a small extent.

● [212] Implements are confined to the hoe (*pukuwiet*), axe (*ishiet*), and ordinary knife (*asubuiet* or *ratet*), though the use of the *panga* or native [195] is spreading. Hoe-blades (made by Nandi smiths) and *pangas* (sold by traders) are got from the Nandi in exchange for baskets, honey, or skins. The billhook, though used by the Nandi had not been adopted by the Dorobo in 1939.

The ground is prepared in the same way as by the Nandi. The top soil is dug with the hoe, collected into small heaps, and fired; it is left smouldering for several days and the burnt earth and vegetable ash are then spread over the plot and dug in with the hoe. Seed of maize and eleusine is [194] bought from any Nandi who is willing to sell it, usually one of the numerous [195] squatters on the nearby farms[*]. The Dorobo get two basketfuls in exchange for one basket. Potatoes (when not got in the same way) are generally grown by eleusines, less maize and eleusine are planted together in the same pits so that the eleusine grows up between the maize plants. Maize has thus to be sown wider than is really economic, but it is a Nandi habit, and in favour of it one may say that the intervening spaces are partially covered and thus there is a chance of preventing some erosion in the early stage when the ground is clean, for when the crop is a few inches high, people turn out to weed, a process rejected if the land gets very dirty.

[197] Each shamba is surrounded by a loose mesh of thorns and bushes, with occasional posts to strengthen it where necessary, and trees or stumps are included in the fence when they occur in suitable positions. Sometimes there is a gate formed of movable upright poles, like the gate of a Nandi cattle-enclosure, but usually the line of fence is unbroken, and access is by way of a rough stile of logs laid across the thorns.

243 Eleusine is reaped in the Nandi fashion by cutting off the heads with a knife, the straw being left to be trampled down and eventually dug in — that is, if the shamba is to be planted again. Maize is picked by hand, but in 1938 it was largely eaten on the field as the cobs developed, so that by the time it was fully ripe there was not much left to reap. By 1939, however, some [197] Dorobo of Kipsikon, noticing the European practice of stacking maize in cribs before it is ripe, cut and stacked their own in the same way, though they did not understand why it was done by the Europeans, whose objects

ol bobongo, i.e., hut of the unmarried men, in contrast to the *ol* to olosho, the camp of the married. Therefore here, too, we find, even in the camps, a separation into kraal of the married and kraal of the warriors, similar to the one mentioned for the Masai.

The arrangement of the interior of the hut, like the form itself, resembles that of the Masai in furnishings, however, are even poorer. A honey pot (*nadik*, *nadinge*), a gourd bottle (*ngai*) for drinking water and honey beer, a leather bag (*lebeus*, *lebeusi*) for collecting honey, a larger one (*nian*, *nianeuik*) for water, a few earthen pots, larger ones (*dog*, *idig*) and smaller ones (*ngoibe*, *ngoibe*) for cooking, a couple of wooden bowls (*ng*), a rope cut out of an animal skin (*ekara*, *ekarage*) to tie up the skin coat, a cord twisted out of the bark fibers of the baobab (*Adansonia digitata*) for the drawing up and letting down of the beehives hung in trees (*ewoligat*), along with a few dehaired skins (*bibi*) that serve as beds, as well as an (*ba'ka*, *baanga*) and knife (*pandang*), constitute the principal household equipment. In a few huts one also finds the ax *dawra* /*park-holdens*/ of the Masai, here called *lolabo* (*lolawua*). *ol'oibi* or a hammer (*ol'oibi*) for forging and a chisel for designing the arrow points (*nat*, *nare*), and finally that sharpened small piece of sheet iron serving as razor-knife (*kad*, *kaaga*). The entire family, namely, husband, wife or wives, and the unmarried children, live in one /*bibi*/ hut. Men and boys, however, are usually out. The day begins even before daybreak for the hunting men. They set out with a snack consisting of a little piece of boiled or roasted meat, so that the first light of day already finds them in the hunting grounds. The game now between hunt; as they say, it then feels more eagerly and carelessly than a few hours later, when the sun already becomes annoying to it. *Ol kaybibuk* women and children leave the huts forward and water are carried up in order to cook the meat hunted from a ladder lowered to a nearby cave. The meat is kept there and not in the camps, so that it longs to the air and thus remains fresh longer. After that the morning meal is eaten. Actually the Wandorobo do not have definite mealtimes so long as there is something edible they simply eat as long as they can.

/333 cont./ As there, the tanned hides are sewed into articles of clothing with an awl (maremeog) and a thread twisted out of animal tendons (aeng). If a number of hides for which, at the moment, one has no need for one's own use has piled up, a few old men with women and children, laden with skins and also steppe salt, set out for a neighboring area. Where the distance between this and the Wandorobo camp is such that it permits frequent trade, these caravans appear at the regularly held markets. If, however, they are able to come only rarely, they peddle their wares, inasmuch as, out of ignorance of time reckoning, they do not wait for the market days. They readily find customers, since both articles are very much in demand. The agriculturalist principally dependent on a vegetable diet always needs salt, but he can only rarely extract it himself, since as a rule the arable soil contains no salt or such not in sufficient quantities. The need for hides /334/ is also often greater than the local production, even today when fabrics have largely replaced the leather clothing. After protracted haggling, an agreement is finally reached, and the [illegible] set out for home with the bartered vegetables. If the hunting was sometimes particularly lucrative or if an elephant or rhinoceros was killed, part of the meat would also be sold to the always meat-hungry agriculturalists. Many of the latter, for example, the Wataita and Wakamba, also buy the meat of predatory animals from the Wandorobo, whom disdain it altogether, and therefore, in trading, they test each piece for smell and taste.

Old men, who only now and then in the evening lie in wait for game at a watering place, devote themselves outside the camp especially to the checking and supervision of the beehives (Fig. 88), a large number of which hang within an hour's range. These are wooden tubes 151 centimeters long and /Fig. 88 appears here/ 34 centimeters thick, with an interior breadth of about 23 centimeters. They are made by hollowing out a correspondingly long piece of tree trunk, a very arduous task because the tools are so primitive. After the trunk, through hewing with an ax, appears circular in cross-section and tapered at both ends, it is smoothed on the outside with a knife (mukiyo). Two instruments are used for the hollowing out

1. [i.e., among the Masai--Amliyet]

/234 cont./

231 322 [412] the first consists of the ax blade stuck into a wooden handle like a knife and is used as a paring chisel; the other is a hollow chisel (aja) with which one smooths the tubes on the inside. The two openings are closed corklike by flat wooden covers fitting into the opening, into each of which two holes permit entry for the wild bees. For hanging, one puts around the middle part two loops twisted out of lianas, which are connected, handlelike, by a plaiting of lianas, like the straps of a holdall. The beehive is picked up by this handle with a hooked branch, at the upper end of which is lashed a second one with a hook on top. With the latter the whole thing is hung in the branches of taller trees. On the side hanging downward the beehive bears an ownership mark. As a rule it is the same as the one that is burned on the long tang or on the extension tang of the arrow point. On the beehive one finds either whole or only its lower part. Before the honey is removed /235/ the bees are driven out by a very smoky fire kindled under the tree (1).

231 [283]

Fig. 81. (1/10)

[922]

[711] 1. I never observed among the El dorobo a stupefying of the bees by means of Bovista (Lycoperdon), such as I saw on Kilimandscharo among the Wadschaggs.

/235 cont./

411 322 [283] [237] with fat several times, it is bent over the fire. The string is plaited together, turning and braidlike, out of short animal tendons and is extended by further interweaving up to the required length. The projecting starting-ends of the individual pieces of tendon are neatly cut off, whereupon one then rubs the now finished bowstring with some fat.

The arrow shaft (Fig. 84) is carved out of a dry wooden stick, first rounded, then smoothed by scraping. The upper end is wound [237] [824] with tendons that have been coated with the varnishlike juice of a not yet described species of gladiolus known as dirigé, whereupon, [412] on top, one drills in the one- /236/ /Figs. 83 and 84 appear here/ 411 centimeter-long hole for the tang of the arrow by a twirling motion [237] with a thin wooden chisel. At the lower end the three-part feather- [136] ing -- out of the feathers of the carrion vulture (Neophron perc- [283] nopterus) -- is first fastened on by being wrapped with a very fine [824] bast thread and then glued fast with the gladiolus juice just mentioned. Another wrapping of animal tendons is found between the feathering and the rear notch for the bowstring, in order to prevent a splitting of the shaft.

[325] [322] [191] [439] The people buy the iron points; only if a point breaks off /237/ do they as a rule forge a new one for themselves. Clubs are carved from a piece of wood, as among the Masai. They buy the spears, of which there are one or more in almost every camp, from the blacksmiths of the Masai. The spears serve as weapons only in the camp, where shooting with arrows is not permitted, on account of the danger connected with that, since they are always poisoned.

415 439 [285] The Asa for the most part buy wooden bowls and gourd bottles from sedentary tribes. On the other hand, in some places they plait shallow baskets, which they use for storing food.

524 829 191 The fact that the Wandorobo do not play the board game so popular among the Masai was explained to me by them with the words "During the game we would forget to hunt and then, with our families, would have to starve."

512 517 [273] [535] [533] With the coming of darkness complete stillness as a rule comes over the camps, quiet even during the day; the day's work is done and everyone goes to his hut. Only on moonlit evenings do the old people often still sit in the open for a few hours, talking, with a gourd bottle of honey beer, while the young men and girls dance and let their falsetto song ring out through the still night, from

[TEXT CONTINUED ON PAGE 313]

/253 cont./

302 [171] [412] [304] [154] manner as among the Masai, but here the eyebrows are also shaved by both sexes. The nails are cut with an ordinary two-edged knife. The two middle lower incisors are not broken out for everyone. Hair and nail cuttings are thrown away or hidden at some distance from the kraal, so that they will not fall into the hands of an evil sorcerer, who would be able to make from them sorcery leading to a sickness for their former wearer.

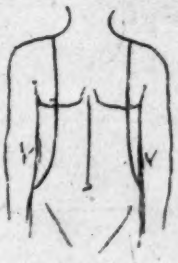

Fig 87.

302 531 [386] The young men and girls color their entire bodies with a paint made out of fat and red earth (ol garis), or the former also only legs and lower arms, and then wipe off the color again in serpentine lines (lama) that run parallel an inch apart. After killing an elephant [171] the happy hunter paints his chest with three lines, the two outer ones of which go from the collarbone over the nipples to the hips, the middle one from the chest to the navel (Fig. 87), or they paint

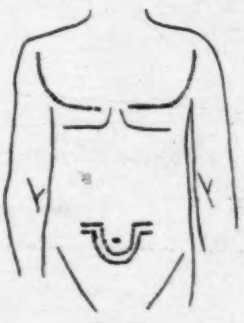

Fig. 88.

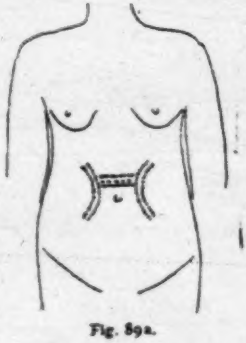

Fig. 89a.

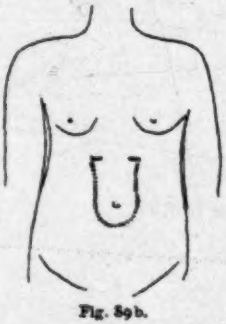

Fig. 89b.

their whole bodies, with the exception of the abdomen, with white and red stripes (like the Masai warriors). The former painting they [192] call katadiridi, the latter they designate with the Masai word eh gituñguat. At feasts the men draw a line with the powder ol mogoñgora = root, from the upper lip upward over nose and forehead to the hairline. Boys (Fig. 88) and girls (Fig. 89) tattoo the lyre 304 figure /254/ of the Masai, the latter also another similar one on the 171 abdomen. Not infrequently one also finds on the face of the women [531] the etched-in ol kigerot design, which has been discussed for the Masai.

/231 cont./

621 [192] [071] to dobonog, i.e., huts of the unmarried men, in contrast to the aija to daſma, the camp of the married. Therefore here, too, we find, even in the name, a separation into kraal of the married and kraal of the warriors, similar to the one mentioned for the Masai.

171 353 The arrangement of the interior of the hut, like the form itself, resembles that of the Masai; its furnishings, however, are even 415 sparser. A honey pot (madjé, madjeog), a gourd bottle (mget) for 237 drinking water and honey beer, a leather bag (lebenu, lebenua) 283 for collecting honey, a larger one (ndaro, ndareraũg) for water, a 352 few earthen pots, larger ones (idug, idia) and smaller ones (ruguba, 412 ruguba) for cooking, a couple of wooden bowls (tagi), a rope cut out of an animal skin (scharu, scháruga) to tie up the slain meat, a cord twisted out of the bark fibers of the baobab (Adansonia digitata) for the drawing up and letting down of the beehives hung in trees (merihgo), along with a few dehaired skins (fulót) that serve as beds, as well as ax (haũo, hauereg) and knife (pandyug), constitute the 492 principal household equipment. In a few huts one also finds the en 412 dereta /pack-holders/ of the Masai, here called lalaho (leleweg), • 413 as well as a hammer (giribét) for forging and a chisel for designing 177 the arrow points (mad, mara), and finally that sharpened small piece of sheet iron serving as razor-knife (herá, hererá). The entire family, 592 namely, husband, wife or wives, and the uncircumcised children, live in one /232/ hut. Men and boys, however, are usually out.

512 [224] [264] [825] The day begins even before daybreak for the hunting men. They set out with a snack consisting of a little piece of boiled or roasted meat, so that the first light of day already finds them in the hunting grounds. The game now behaves best; as they say, it then feeds more eagerly and carelessly than a few hours later, when the sun already becomes annoying to it. At daybreak women and children leave the huts; firewood and water are carried up in order to cook the meat fetched from a larder located in a nearby tree. The meat [251] is kept there and not in the camp, so that it hangs in the air and 512 thus remains fresh longer. After that the morning meal is eaten. 264 Actually the Wandorobo do not have definite mealtimes: as long as there is something edible they simply eat as long as they can.

1:Huntingford E-4, 5 (1938-1939) 1953 FL6 Dorobo FL6

tree," *rotinuet* (*kigelia æthiopica*); and *maiyek*, cleusine beer, made, though seldom, in the Nandi way. They also drink a mixture of honey and water called *lohomek*.

Trade and Exchange

The inability of the Dorobo to produce many of the things they need has led to the development of a system of exchange with the Nandi, who till recently were almost the only people with whom they had dealings. Relations between Dorobo and Nandi have been such that, though maintaining their complete independence, the Dorobo have not only obtained goods by trade, but have acquired and assimilated much Nandi culture, including language, clan-names, agriculture, and many material features like dress and ornaments. Their relations are in general friendly, for the Nandi like honey and furs which they get most easily from the Dorobo, and there has been an increasing number of marriages of Dorobo men with Nandi women, as well as of Dorobo women with Nandi men. But neither side takes liberties with the other: the Dorobo fear the physical superiority of the Nandi, and the Nandi fear the close-to-nature life of the Dorobo, as well as a certain mystical force as rain-makers which they attribute to them.

From the Nandi the Dorobo get objects of iron, pottery, beads, tobacco, cattle (see below, p. 61), and the seed of cereals for planting. The Nandi get skins and honey from the Dorobo. There are no special places for trade, but the Dorobo go to the nearest smith or potter or other person who can supply them, and make their bargains. This means a journey into the Nandi Land Unit, but other things can be got from the nearest friendly Nandi. The exchange values in 1939 were:

1 axe for 1 bagful of honey;
1 bundle of tobacco (about 1 lb.) for 1 bagful of honey;
1 arrowhead for 1 gourd full of honey;
1s. worth of trade beads for a gourd full of honey;
1 knife for a day's weeding in the smith's garden;
1 large earthenware pot for 1 large prepared buck skin (usually bush-buck)
1 small earthenware pot for 1 small prepared buck skin (usually duiker);
2 baskets of seed for planting for 1 new basket.

The bag, *motohet*, is made of skin and measures about 8 ins. by 7 ins.; the gourd is about 10 ins. long; the large pot is about 20 ins. high, the small pot about 10 ins. high; and the basket is about 6 ins. deep and 6 ins. wide.

Cattle

The Dorobo interest in cattle is probably due to their long contact with the Nandi; but though they desire cattle, they have not the land for them. Yet they have speculated about cattle inheritance, and by 1939 had worked out theoretical rules which they had scarcely had opportunities of testing. When they were evicted from the forest in 1937 they were officially credited with about 2,000 head of cattle; but no census of either people or stock appears to have been made in preparation for this event, and most of these cattle did not belong to real Dorobo. In 1938–9 the numbers of stock which I counted during the compilation of my census were:

	Cattle	Goats	Dogs
Koret of Kiphorom ..	25	15	4
Koret of Sosoiyo ..	54	19	3
Koret of Kelpai	11	0	0
	90	34	7

Methods of cattle-management are based on those of the Nandi.

1:Huntingford E-4, 5 (1938-1939) 1953 FL6 Dorobo FL6

find lying about on the farms. The only weapon is the bow, *kuyagda*, which the Dorobo make themselves from the *kuriot* tree (*isvlea* sp.); it is about 5 ft. long, and the bowstring, *inot*, is made from gut of the giant pig, *tumda*. Arrow-shafts are made from the *kromandet* and *masaita* trees, or from bamboo, *sosoiyat*; arrow-heads are bought from the Nandi, and are of the Nandi patterns. Arrows are carried in quivers made of hide. Arrow poison is made from the *keliot* bush (*acocanthera Schimperi*).

Baskets

Making baskets, *kerepet*, is a common occupation of Dorobo women. They are made from fibre of the *phœnix reclinata* palm, *sosiot*, and sewn with bast made from a plant called *tapuraiot*. The technique is a spiral foundation with a flat then gradually ascending coil, of the simple over-sewn type and bee-skep variety, the stitches being spaced out and not close together.

Miscellaneous

Salt used to be made from the ashes of the plant *tepenguet* (*amilia integrifolia*). Red and white earth is found near Timboroa on the east of the Dorobo country, and men go in parties of four or five to dig it, carrying home the earth in large leather bags, mainly in order to sell it to the Nandi who, in 1930, gave them 2s. a bag. Red earth, *erokoit*, is mixed with fat or simsim oil for rubbing on the hair; white earth, *eworiot*, has magico-religious uses. For carrying a number of small objects a carrying-net called *lekuelet* is used; it is made of a pair of oval rims 3 ft. 6 ins. long with pieces of liana stretched across them, somewhat resembling a pair of handleless tennis rackets. These are sometimes used by the Nandi.

Ritual and Beliefs

Religion

Asista, the sun, is recognized as a being that can supply or withhold the needs of people: *Asis, ipiiyec panyek*, "*Asis*, fill us with meat," is a common prayer. Some say that *Arana* the moon is his sister, others that she is his mother. Besides *Asis*, it is believed that there is a being called *Ilet*, the thunder, who produces rain, and "the rainbow is his arm which draws up water for him." The Dorobo also believe in spirits, good and bad, both of which are called *cesowiloi*, a word which includes the *oiik* (ancestral spirits) and *musambuanik* (evil spirits) of the Nandi. The ancestral spirits have the same significance and functions as those of the Nandi, and though they punish the living for doing evil, they are otherwise friendly and visit the living, travelling in the bodies of snakes, both to see their people and to get food in the form of *lokomek* (honey and water); spirit-snakes should not be killed.

Divination

The Dorobo appear to have no diviners of their own, and when they have recourse to divination, as in cases of illness or witchcraft, they go to Nandi diviners of the type called *takeyuot*, by whom they are charged a small fee. The people called *orkoiyot* (pl. *orkoiik*) among the Dorobo are no more than leeches or physicians who prepare healing medicines from trees and plants. Although the Dorobo have a reputation among other tribes as powerful rain-makers, they themselves say that they have no rain-makers, which is probably true.

Death and Burial

Very old men and women are buried in narrow holes about 5 ft. deep in which the bodies are laid full length wearing their clothes; one year after an old man's death his children plant a branch of *mukupcot* (*dracæna* sp.) on his grave and let it grow. Other people are laid out for the hyenas, both sexes on the right side with

2: Maguire G-5 (ca. 1926) 1927-28
FL6 Dorobo FL6

411 [386] through use and continuous contact with hands and bodies which are frequently anointed with *Ol-kária*.[1]

[237] The bowstring (*inee*) is made from the sinew embedded in the dorsal muscles of an ox, eland, greater kudu or hartebeest. Occasionally it may be manufactured from the tendon of a giraffe's leg.

[415] The quiver (*mootiet*)[2] is a cylinder of ox-, eland- or kudu-skin about two-and-a-half feet in length and capable of containing from fifteen to thirty arrows. A strap runs down one side and is attached to the removable cap. When this cap is put on, the strap, taut over the wearer's shoulder, keeps it in place. The quiver is the same in all respects as that used by the Masai, and an illustration of it will be found on p. 356 of *The Masai; their Language and Folklore* (Hollis).

The arrows (*kátik*; sing. *káte*) vary in length according to the size of the owner. They are generally between twenty and thirty inches long. Many kinds of wood are used for the making of the arrow-shaft (*muliandee*). The arrow-head (*sivelda*), which is made from any scraps of iron that can be obtained (since the decline of the *Il-Kunóno*,[3] no iron is smelted in Tanganyika Masailand, and swords and spears are made, almost exclusively, by the Chaga and the Wanguu), consists of a single barb. The hole bored in the shaft to receive it is reinforced with sinew (*Máisie*) from the leg of an ox. This is bound round the aperture, and then the work is smeared with a kind of gum (*ité*) obtained from the *Ñgoisiandee*[4] tree. The arrow feathers are those of the vulture (*Ara'chee*) or the long-legged insect-eating bird called *Endera'hi*. The feathers are bound to the shaft with thin gut and the whole (including the nock) is then coated with a sticky paste obtained by chewing a tuber (*sikóitie*). This paste is smeared on and allowed to dry in the sun, when the result is surprisingly strong and well-knit.

[531] Dorobo arrows are workmanlike and extremely strong, but they are seldom if ever embellished or ornamented in any way.

The arrow-head is generally (when coated with fresh poison)

[1] See note, p. 138 *loc. cit.*
[2] Cf. the Masai *Ol-mótian*.
[3] See note 2, p. 251.
[4] Cf. the Masai *Ol-ngorwa* (*Balanites sp.*; Hollis). The same tree.

2: Maguire G-5 (ca. 1926) 1927-28
FL6 Dorobo FL6

covered with a strip of soft hide—often that of reedbuck or impala—worked to a state of pliability resembling that of chamois leather. The barb is never coated with poison under any circumstance. 411

A small supply of fresh poison (*ngwane*) is sometimes carried in the heel of the quiver. This poison is a black, sticky mass made by boiling the leaves of a certain tree and is manufactured exclusively by the Wakamba. The Dorobo know nothing about it, hold it in considerable awe, and have never attempted to make poison of their own.[1] [278] [439]

In the quiver is also carried a fire-stick (*Ol-kiriañgeti*) and a fire-block (*sasamda*). The Dorobo are experts at making fire and scorn to use matches. A small flat spoon (*kanuléuandee*) for smearing poison on the arrow-heads is also carried—this spoon is made from the same wood as the bow; and a small knife for smoothing and rounding the arrow-shafts. This knife is called *orueta siléld*.[2] A wooden tube about twelve to eighteen inches long and a quarter of an inch in diameter, not unlike a peashooter, will always be found in a Dorobo quiver. This tube, called *endulee*, is used for drinking from pools which are shallow or which have a dirty, scummy surface. (It is a point of honour with every Dorobo and an unwritten bush law that a man should not stir up the mud in any water at which he drinks.) The *endulee* is also used to induce, by blowing through it, a blaze or clouds of smoke from lighted grass put into a hive to drive the bees away from the honey. 372 410 [577] 227

A Dorobo quiver, as we have seen, contains a large number of objects essential to the bush life that the Dorobo leads. It is scarcely to be wondered at, therefore, that it is next to impossible to purchase a furnished one. A Dorobo once told me (I am sure he meant it) that he would not exchange his quiver and its contents for five oxen. The price habitually paid to the parents of a girl taken in marriage is from two to five arrows, and a demand on the parents' part for a full quiver would be regarded as extortionate. 415 [583]

The Dorobo may be seen sometimes with a small axe which 412

[1] That is, arrow poison. The Dorobo are reputed to have a powerful poison they mix with snuff. When inhaled, it is stated to have a fatal result. I have been unable to obtain a specimen of this poison and doubt its existence. [278]

[2] Literally, "*Small knife.*"

2: Maguire G-5 (ca. 1926) 1927-28
FL6 Dorobo FL6

differs little from that used by the Masai and many Bantu tribes. This axe is, primarily, a tool and not a weapon. They also carry the usual Masai club, which they call *rungu*'.[1] This club is used indiscriminately as a throwing or hitting weapon. The Dorobo are excellent shots with it, but are more expert with the bow. The latter weapon they seem to venerate; they are for ever holding archery competitions among themselves, and it is no uncommon sight to see a Dorobo dreamily twanging the taut string of his bow (often little shorter than himself) and deriving obvious pleasure from the sound produced thereby.

A skin bag or bottle, of the usual Masai pattern, is used to bring home honey collected in the bush. The Dorobo carry this, when full (the same remark applies to any other load), by means of a strap of bark or leather round the forehead. The load hangs between the shoulder-blades in the usual Masai fashion.

THE *MÓSIRO* AND *ARAMANIK* LANGUAGES

(A comparative list of numerals, words and tenses, with the equivalents in Masai and Nandi.)

The following symbols or marks have been used to assist in the correct pronunciation of the numerals and the short lists of words and tenses given. They have also been used throughout the text. Most of them are used as in Hollis's well-known works on the Masai and Nandi.

The symbol ~ when superimposed denotes that the *ŋg* occurring in the word has the same sound as the English *singer*. In cases where it does not appear the *g* is hard.

A diaeresis has its usual grammatical significance.

´ denotes that the letter beneath it is definitely accented.

¯ denotes a long open vowel. *ee* has been used in some words to denote an inimitable, long, drawling sound.

An elevated letter (as in *dalo*^{k}) denotes that the letter in question is barely perceptibly sounded.

Where ˆ appears over a vowel, it means that the latter has a

[1] This club is almost always made of the wood of a tree called by the Masai *Ol-oirien*. According to the authority quoted in Hollis, this tree is the wild olive (*Olea chrysophylla*). *Ol-oirien* may also mean the heart-wood of a tree (Hollis).

3:Huntingford E-5 (1921-1928)1929 FL6 Dorobo FL6

II.—Mode of Subsistence.

Houses.

342 [361] The Dorobo live in little shelters or huts (*kochongot*, pl. *kochongwiek*; N. *kwiet*) built in small clearings in the forest; they are made of a framework of sticks stuck in the ground, and bent over, forming a domed roof; the whole is covered on the outside with leaves of trees and banana leaves, which are insufficient, in spite of the addition of an ox-hide on the top, to keep the hut dry inside when it rains. The upright sticks are strengthened by others tied across them with tree-rope. The huts are oblong, with rounded ends, and are of the following average dimensions:—Height, 5 ft. 10 ins.; width, 7 ft. 6 ins.; length, 11 ft. They are occupied for two or three months, after which they become ruinous and "full of fleas," when the [590] family moves to a fresh site. Two to four people live in one hut. One group of huts we saw contained two huts, and had contained a third which had been pulled down. The huts are divided into two parts, the sleeping-place (*iitkia*, N.) and the [353] fire-place, which are separated by two or three poles laid across the floor of the hut, [513] on one side of which are laid ox-hides (*maŕsaik*; N. *maisai*), upon which the occupants eat and sleep; at night they cover themselves with skins. In the other half of the hut is the door (*kurket*, N.), about 2 ft. high. Some huts have two doors, opposite [354] each other. Between the door and the sleeping-place is the hearth (*mdt*, N.), consisting of two or three smallish stones set on the floor. A loft (*sainet*, N.) is sometimes made in this part of the hut, extending across the width, and ending at the beginning of the sleeping-place. The loft is about 2 ft. 6 ins. above the floor, and is made of thin sticks supported on thicker cross-sticks, and tied together with [251] tree-rope. Upon it are kept firewood and eleusine grain (Text-figs. 26–28). The [317] only household utensils are a small broom (*sedtutiet*) about 14 ins. long, made of [412] a bush-buck's tail fastened to a thin wooden handle, for sweeping the floor; "water [415] jars" (*soiyot*) made of a hollowed piece of bamboo about 2½ ins. wide and 2 ft. 8 ins. long; a grindstone (*litito*, N.) made of granite, for sharpening knives, and for grinding eleusine grain. Gourds and earthenware pots are obtained from the [439] Nandi; the Dorobo have no stools. Fire is produced by means of fire-sticks (*piinet*; 342 N. *piónet*) (Text-figs. 11*a*, 11*b*). A thin stick of the choruet tree (*N.*),[1] about 15 ins. long and ¼ in. thick, is stood upright on a stick of cedar (*test*)[2] about 26 ins. long and 1 in. wide. The thin stick is called piinet, the cedar stick tasamet. The piinet is held between the palms of the hands, and the hands are rapidly rubbed together, beginning at the top of the piinet and working downwards (Pl. XXVI, *Fig.* 2). This is repeated until fire is obtained; the piinet drills a hole in the tasamet, and the heated wood-dust thus produced falls on to a knife-blade which is placed underneath. When sufficient heat is obtained it is laid on a small bundle of tinder (*saoyat* (dry grass) or fibre of the porówet[3] tree), and blown till the tinder kindles.

prepare food and wait upon the men, themselves eating when the men have finished. At the present day the Dorobo are taking to eating eleusine grain, which is crushed on grindstones (*lotta*, N.) and made into a sort of porridge; and milk, which they obtain from Nandi, if there are any near them. Beer is made from honey, and is called *kipketindi* (N.). Tobacco (*tomotet*, N.; or *chepkendeiti*,[1] N.) is bought from the Nandi, and is taken by men, and occasionally by women. It is either chewed (*soit*, N.) or smoked in Kavirondo pipes (*torbuit-ap-tomotet*, or *kondiondi*, N.), which are also obtained from the Nandi. The men carry tobacco in cylindrical boxes called *kiprowoit* (N. *kiprowi*) (Text-fig. 22), made from *somiyot* (bamboo), with skin coverings for the ends, to which are attached thin leather thongs, by which the box is slung round the neck.[2]

Agriculture and Stock.

Formerly the Dorobo possessed no stock, nor did they till the ground. During the last quarter of a century or so a few of these living on the edge of the forest have taken to cultivating small plantations (*imbowet*, N.), in which they grow eleusine grain (*silluiet*†, or *puiuk*; N. *pûi*) only. A few possess, at the present day, one or two cows; others have a few goats and sheep; no one has more than 5 to 10 head. The only animals they possess in numbers are dogs.

Dress and Ornaments.

(i) *Males.*—Boys wear skins of antelopes and monkeys (*akuriet*; N. *ingurisi*). Warriors wear skin garments of duiker (*ngomongo*,[3] N.) called akuriet; they wear leg-bells attached to a leather band (*ngotitiko*,[3] pl. *ngotitikoisiek*) on the ankles. Nowadays some wear pieces of cotton-cloth (*sogot*, N.) dyed brown.[4] Old men wear bush-buck skins (*akuriet*) with the fur left on. Capes (*engerusit*†) are worn, of blue duiker skin with the fur left on, by old men, and of cotton-cloth by warriors. Belts (*entorrit*†) of leather are worn by old men, and of beads by boys and warriors. Necklaces of chains (*sirimdo*, N.) or iron-wire (*asingusit*, N.) are worn; also various kinds of iron ear-rings (*olaimeriat*† and *kimeitaiit* (Text-figs. 13-17); N. *kimeiteitiot*) are worn by warriors and elders.

(ii) *Females.*—The dress of the women and girls is very similar to that of Nandi women. They wear skirts (*chepkuiyuit*; N. *chepkuswi*) and upper garments (*kolilet*, N.), both of tanned leather, with the fur removed, in the same manner as the Nandi women. Their ornaments consist of iron-wire armlets and leglets (*maliwotuik* and *kurik*, N.), and wire necklaces (*asingusit*, pl. *asingusiek*, N.). Married women wear

[1] *Chepkeketit* means "snuff" in Nandi.

[2] These are similar to the Nandi tobacco-boxes, from which indeed they are probably borrowed.

[3] As do the Nandi, from whom doubtless the custom spread to the Dorobo.

3:Huntingford E-5 (921-9218)929 FLA Dicotyo FLA

411 *Bows.*—These are made from the hazel (K.) tree, and average 3 ft. 1 in. in length. The string (net, K.), which is made from the entrails of the giant pig (wambu, K.), is tied to the bow (Text-fig. 4).

[339] [338] *Arrows.*—The iron heads (kipsiliyat) are bought from the Nandi, and are usually of the Nandi shapes called chaplelelgiot (Text-fig. 5) and kipsiongot (Text-fig. 6) (R.N. Figs. 30, 34). They are from 2½ ins. to 4 ins. long. They are always tanged, and are inserted in a slit made in the arrow-shaft (Text-fig. 8) and bound with fibre or skin binding (simotin). The shafts are made of the sawiyot (hazel-rod), emanin, and kwenanyiot trees, and are of an average length of 2 ft. Three are three feathers (kwerik, K.), which are split and trimmed, and bound to the shaft by a spirally-bound cord (Text-fig. 6). The shaft immediately above the feathers is bound with skin strands; the notch (nuin) is shortened, and bound over the shoulder with a skin strands. The length of the feathers is 3 ins. to 3½ ins. Arrows are kept in a quiver (Text-fig. 10) (sumtiet K.; sabulgiet) of leather, and about 2 ft. 2½ ins. long, with a leather cap and a sling for carrying it round the body. (For the position assumed by Dorobo for shooting with the bow, see R.N., pl. VIII.)

412 *Knives.*—The iron blades are bought from the Nandi. They vary in length from 9 ins. to 12 ins., and are about 1¼ ins. wide. The handles are about 5 ins. long, of wood, with spiral marks cut in them, and covered with skin, which is pressed into the marks so that they show through the skin. The knives are carried in leather sheaths (shukut, K.) which are attached to leather belts (sepsiwet, K.) (Text-fig. 9).

(b) Leather.

381 Skins are dressed and trimmed, and furnish, besides articles of dress and bedding, quivers, sheaths and bags. The ordinary type of bag is called sumtiet.
• 415 It is used for various purposes, including carrying honey; for honey-bags, the fur is removed. Bags for carrying other things are made of antelope skin (e.g. dipsiket, blue duiker) with the fur left on, and flaps to shut them, which are fastened by a
[419] skin cord tied round the bag (Text-fig. 12). They are slung from the shoulders by a skin cord. Small bags are about 7 ins. by 6½ ins.; others are larger.

(c) Baskets (*kwopet*, pl. *kwopsuik* (K.)).

285 [420] These are made by the women. They resemble Nandi baskets of the same name. The upright straws in the baskets are called tapetik; the cross straws, sosik (K. = *Phoenix reclinata* palm). The bottoms are flat and are made of skin, which is sewn to the sides. Some have a handle of skin. The average depth of the baskets is 6 ins., width at top 6½ ins. (Text-fig. 11).

(d) Miscellaneous.

482 For carrying things in the forest, a contraption called lokwalet (K.) is used (Text-fig. 13). It consists of two oval objects somewhat like tennis rackets fastened

Cambridge E-S (1938-/039) 1911 PLA Durobe PLA

needle is, i.e. as the bone and gate this, a new end is shaved under the binding; the heat is kept handy in a bundle. The technique is a spiral combination with a fat, then gradually ascending and, of the single over-seen type, and two-step variety, the stitches being spaced out and not close together. The base of the basket is formed of six fibre coils, sewn together with heat. A hole is made with the needle, and the heat is pushed through it. Or frequent intervals the fibre and the heat are maintained with the lips. After the first six coils, a slight rise is made: as each coil makes a complete circle it is slightly raised in order to make the bend between the base and the sides. When a new piece of heat is needed it is shaved right through the hole, leaving about ½ to 1 inch on the other side, and is sewn through as before. The basket maker works with lengths of heat of 6 to 12 inches. The fibre coil is of about the thickness of a pencil, and this must be maintained. When the length of fibre is reduced to about 2 ft. it begins to get thin, and some new strips must be added by shaving off a further length. The structure of the basket is thus, in effect, a continuous coil of compressed fibre, each line of coil tied to the next by stitches of heat. Sometimes the base is made of a circular piece of leather, in which the heat will be sewn. The rest of the procedure being the same as for the all-fibre basket.

The dressing of skins, including those used for exchange, is a simple process, for no chemical agent is applied. The newly flayed skin is tightly pegged out on the ground while it is still wet and left to dry in the sun. When dry, it becomes stiff, and in this state it is rubbed with an axe-blade held at an angle of about 20°, the blade being rubbed backwards and forwards till the skin is soft and supple. If it is to be used for a woman's garment or other object in which fur is not needed, both sides are rubbed. Skins are dressed by women. Apart from clothing, the chief objects made of skin are bags, quivers, and parts of tobacco-boxes. The material used for sewing is generally pig-gut. The needle of course has no eye, and the method of sewing is therefore to make a hole with the needle and then push the gut through it. Bags, satchels are used for many purposes, including the carrying of honey and coloured earth. They are generally made of antelope skin (e.g. blue duiker), and unless intended for honey the fur is left on the outside. They are provided with a flap, a strap for fastening and a sling for carrying them from the shoulder. A common size is 7 ins. by 6 ½ ins., but I have seen them as big as 19 ins. by 16 ins. Tobacco-boxes are made from internodes of bamboo, but they have leather covers at each end, and a thin leather strap is sewn to the covers so that the owner can sling the box round his neck.

The nature of Durobe life demands exchange of products with the Kundi. The most important of the products they get by exchange is ironwork; other things are pottery, beads, tobacco, cereal seeds, and cattle, and a fairly definite, though possibly fluctuating, scale of exchange values has come into existence. In 1938 some of these values were:

1 axe for 1 kaglol of honey.
1 arrowhead for a gourd full of honey.
2 knives for 1 day's weeding in the blacksmith's shamba.

A form of

[274] [277] [283] [285] [286] [287] [288] [289] [290] [291] [292] [293] [294] [295] [296] [297] [298] [299] [300] [301] [302] [303] [304] [305] [306] [307] [308] [309] [310] [311] [312] [313] [314] [315] [316] [317] [318] [319] [320] [321] [322] [323] [324]

in the dense forests of Kenia and Kikuyu, the forest-clad escarpment of Mau, the top of Elgeyo, Marakwet, Chilchinagwoni, Buru, Doukoie etc. They are rarely found in numbers and usually in very small villages, so that there is nothing like tribal /55/ life among them. They enjoy considerable immunity from attack by the Masai, as they are sources of wealth to the latter by attracting the game traders; usually, too, the Masai fall heir to a considerable share of the ivory. They also act as go-betweens or middlemen in getting the married people the vegetable food they require. To such an extent is this system carried, that on the plateau to the east of Naivasha at the place called by the traders Miansi-ni, a very large village of Andorobbo have altogether given up hunting, and subsist entirely by buying vegetable food from the Wa-kikuyu and selling it again to the Masai or it may be the traders.

"The language spoken by the Andorobbo is allied to that of the Masai, but they can all speak the latter in its purity. They build regular villages, and in general appearance they resemble the inferior class of Masai. As I have already remarked, they make the buffalo-hide shields of the warriors as well as the coarse earthen cooking-pots of the women. They are on the whole looked upon as a species of serf, and treated accordingly. Their transactions with the traders must be done secretly, or everything would be stolen from them."

Mr. C.W. Hobley, in the glossary to his Ikuyu Beliefs and Magic, says:

"Dorobo in Masai means tsetse fly. The name for an aboriginal race of hunters who inhabit the great forests of the highlands in East Africa. They call themselves Aci and the Kikuyu call them Adzi. The name of the Athi River is believed to be a corruption of Adzi."

[P.192, 6]

and by personal ability, and therefore to some extent by their geographical setting. They have no iron ore, no metallurgic knowledge, and no all[illegible] ivorywork is imported from the Shank. Whatever which they like, is not grown or yet, and this too must be obtained from the Shank. There is a regular exchange of ivory, skins, and leaders, for wristbands, knives, tobacco, seeds, pottery, etc., and a scale of exchange values has come into existence:

1 seven head is given for a pound of ivory.
1 bundle of tobacco is given for a bag of ivory.
1 large pot is given for a large leatherish skin.
1 small pot is given for a duiker skin.
½ leatherish of seed for one leather.

Sometimes personal services are given, e.g. a day's working in the world's garden for two knives.

Cattle are obtained from the Shank, in a limited extent, by a system of gift exchange for ivory. The Shank make friends with the Dendo chiefly for the purpose of getting ivory, and the Dendo will give some to the Shank friend without expectation of an immediate return. Presently the Shank gives the Dendo a goat, and this exchange of gifts paves the way for further and more important transactions: eventually the Dendo offers his friend a fat cheek for an ox, or e.g. my friend Jump Wimby acquired one from a Shank called Englishe or Chinee; he also got another in exchange for 7 goats, which he bought out of his wages for working on a farm.

C. Technique

1. Hunting

The dry weather, *mwahmwah*, is the shooting season, and the wet weather, *mwa*, is the time for trapping. The weapon is the bow and arrow (poisoned) and by the Kapelepalemwa Dendo, and the hunters are dogs.

In wet weather hunt any weight in traps. In the dry season, what pig of various kinds* were

*e.g. [illegible] is about 12 lbs. dung and 2 lbs. milk; a [illegible] about twice as much dung as a goat; a [illegible] is about 4 lbs. dung and ½ lb. milk a day.

*Pangolin, the scaly-ant (Phataginus subcaudatus) and Civet, the palm hog or tree-pig (Nandinia [illegible])

/301 cont./

as delong, i.e., lots of the unmarried men, in contrast to the side to father, the camp of the married. Therefore here, too, we find, even in the camp, a separation into head of the married and head of the unmarried, similar to the one mentioned for the ideal.

The arrangement of the interior of the hut, like the farm itself, resembles that of the ideal; its furnishings, however, are even sparser. A honey pot (natik, natjang), a gourd bottle (ngar) for drinking water and honey beer, a leather bag (ehem, ehemin) for collecting honey, a larger one (ehem, ehemnig) for water, a few earthen pots, larger ones (thig, thin) and smaller ones (ngaha, ngahe) for cooking, a couple of wooden bowls (ng), a rope cut out of an animal skin (ehen, ehingn) to tie up the skin bags, a cord twisted out of the bark fibers of the basket (Ahamonia digitata) for the drawing up and letting down of the bedclothes hung in trees (nerthgn), along with a few skinned skins (hide) that serve as beds, as well as an (ehe, hoonng) and knife (nanthgn), constitute the principal household equipment. In a few huts one also finds the ear sheers /pair-holders/ of the ideal, here called ishaha (ishoongh), as well as a hammer (ghthk) for forging and a chisel for designing the arrow points (mah, ihern), and finally that eloquent exact piece of steel iron serving as razor-knife (hank, hanngh). The entire family, namely, husband, wife or wives, and the unmarried children, live in one /301/ hut. Men and boys, however, are usually out. The day begins even before daybreak for the hunting men. They eat one with a snack consisting of a little piece of boiled or roasted meat, so that the first light of day already finds them in the hunting grounds. The game now behaves just as they say. A man feels more eagerly and cautiously than a fox lures lion, when the sun already becomes annoying to it. At daybreak women and children leave the huts (covered and crude) are carried up in order to cook the meat fetched from a larder located in a nearby tree. The meat is kept there and not in the camp, so that it hangs in the air and thus remains fresh longer. After that the morning meal is eaten. Normally the Wandorobbo do not have definite mealtimes as long as there is something edible they simply eat as long as they can.

Lh Marker--506 G-6 (1500-ca.1908) 1910 FLIS Masai
Dorobo FLS
Asa

/339 cont./

262 If lean times does come, one tries, as well as one can, to appease
the stomach with wild roots or tubers, with berries or other small
[252] fruits, with honey and honey beer. Meat is seldom eaten raw,
usually boiled or roasted at the open fire. For storage it is cut into
251 long strips that are hung to dry in the sun. When the meat is well
dried, it is stowed away in the aforementioned tree, close to the
231 camps; cattle and small livestock, which are bought from the Masai
for ivory, are not kept, but slaughtered immediately. Insofar as the
262 Wandorobo, in barter with mountain tribes, are able to come into
[339] the possession of vegetables, they also live on these, but actually
only during times when, for some reason, only little game is to be
had. Otherwise the vegetable food acquired by trade constitutes
only a side dish, especially for women and children. Many of them
[272] detest milk and base this on the fact that their stomachs, accustomed
only to meat diet from early childhood, do not tolerate it. Some
go so far as to throw away the udder of a slaughtered cow, although
[271] they eat that of a slain piece of game. There indeed seems to be no
doubt but that the previously mentioned Masai belief, according to
which milk and meat must not be brought together, rests on these
273 customs. Besides water, honey beer, which they make in the same
[311] way as the Masai, also serves them as a beverage. The latter price
[271] that made by them more than their own, which probably rests on the
fact that the Wandorobo keep the good honey for themselves and sell
254 only the inferior kind. Men, women, and children eat together.
[258] both the foods for the men, his wives, and children and, on the other
[265] hand, those for the youth and his favorite girl are cooked in one pot.
From this the food is poured into small wooden bowls (kinkeng), of
273 which each adult drawing in the meal has his own. From the food
191 laws of the Masai, the custom that young uncircumcised men may not
drink honey beer is still found here as a survival. Tobacco is a
276 luxury of the married. Men smoke it, coarsely cut, in pipes carved
by themselves. Ground to powder and mixed with a little soapy
ash and /339/ fat, it serves both men and women for snuffing.
Women also like to chew the snuff.

231 /310 cont./

Then a man climbs up to the beehive, fastens it to a rope, unhooks it, and very slowly lowers it to the ground, so that through the continuing effect of the smoke the bees will also be driven out of the combs or stupefied in them. It is obvious that through this the honey must become very dirty, and, in fact, it tastes strongly of smoke and contains a large number of dead bees and larvae. No other method of driving the bees out is possible, however, and since they are extremely vicious and the people, only scantily clad, expose such large areas for their stings, the honey gatherers have to be enveloped in a thick cloud of smoke for their own protection. I was able to observe the viciousness of the native bees several times. It is by no means rare that a swarm will attack a caravan and sting some of the porters and donkeys into unconsciousness, the latter even to death. Tobacco smoke in particular incites them to attack, but they also seem to dislike loud singing and shouting.

In extracting the honey, one leaves about a quarter of it in each comb so that the bees will not abandon the hive. The extracted honey is packed into leather bags or wooden pots and thus stored. The capture of wild bees is unknown. Where such are found in a hollow tree, one hangs in the vicinity an empty beehive that has previously been smeared on the inside with the extraordinarily aromatic honey of a Melipona species (subspecies Trigona) (2)

2. Identified by Herr Dr. Enderlein from samples sent to the Museum für Naturkunde /Museum of Natural Science/, Berlin.

222 known as oi nuth. In order to be able to extract the honey of wild bees from hollow trees, one drives them out by holding aloft a burning branch with which one climbs to the hole.

In the camp one sees the men either squatting about dully or busy with carving, such as the beehives just mentioned, or with making bows, arrows, and clubs. The stick intended for the making of a bow (Fig. 53) (from the oi lumpai tree) is rounded, cut tapering at both ends, and then scraped smooth. After it has been rubbed

/235 cont./

411 322 [283] [237] with fat several times, it is bent over the fire. The string is plaited together, turning and braidlike, out of short animal tendons and is extended by further interweaving up to the required length. The projecting starting-ends of the individual pieces of tendon are neatly cut off, whereupon one then rubs the now finished bowstring with some fat.

[237] [324] [412] The arrow shaft (Fig. 84) is carved out of a dry wooden stick, first rounded, then smoothed by scraping. The upper end is wound with tendons that have been coated with the varnishlike juice of a not yet described species of gladiolus known as dirit, whereupon, on top, one drills in the one- /236/ /Figs. 83 and 84 appear here/ 411 [237] [136] [283] [324] centimeter-long hole for the tang of the arrow by a twirling motion with a thin wooden chisel. At the lower end the three-part feathering -- out of the feathers of the carrion vulture (Neophron percnopterus) -- is first fastened on by being wrapped with a very fine bast thread and then glued fast with the gladiolus juice just mentioned. Another wrapping of animal tendons is found between the feathering and the rear notch for the bowstring, in order to prevent a splitting of the shaft.

[325] [322] [171] [439] The people buy the iron points; only if a point breaks off /237/ do they as a rule forge a new one for themselves. Clubs are carved from a piece of wood, as among the Masai. They buy the spears, of which there are one or more in almost every camp, from the blacksmiths of the Masai. The spears serve as weapons only in the camp, where shooting with arrows is not permitted, on account of the danger connected with that, since they are always poisoned.

* 415 [439] [285] The Asa for the most part buy wooden bowls and gourd bottles from sedentary tribes. On the other hand, in some places they plait shallow baskets, which they use for storing food.

524 [171] The fact that the Wandorobbo do not play the board game so popular among the Masai was explained to me by them with the words: "During the game we would forget to hunt and then, with our families, would have to starve."

512 517 [273] [535] [533] With the coming of darkness complete stillness as a rule comes over the camps, quiet even during the day; the day's work is done and everyone goes to his hut. Only on moonlit evenings do the old people often still sit in the open for a few hours, talking, with a gourd bottle of honey beer, while the young men and girls dance and let their falsetto sing ring out through the still night, from

[TEXT CONTINUED ON PAGE 313]

/246 cont./

000 /footnote 1 continued/ be a substantial therapeutic advance to be recorded here." From "Uber Acocanthera Schimperi als Mittel bei Herzkrankheiten/On Acocanthera Schimperi as a Remedy for Heart Ailments." By L. Lewin and E. Stadelmann. From a report delivered to the Berliner medizinischen Gesellschaft /Berlin Medical Society/. Berlin, 1906).

278 824 Although the tree is not rare in the steppe around Kilimandscharo, its poisonous nature nevertheless generally seems to be known only to the Wandorobbo, since other tribes do not manufacture the poison themselves. Thus the former sell it, for example, to the Wadschagga, the [439] Wakahe, the Wakuafi of Aruscha tschini and of Meruberg /Mt. Meru/, the Wapare, etc. To brew the poison two Wandorobbo always go a few thousand meters away from the camp into the bush. After they have collected branches and roots of Acocanthera abyssinica, they split them into thumb-thick sticks and prepare for the cooking in separate places. The wood is boiled for several hours in an earthen pot that is half filled with river water. Then it is removed, and the liquid obtained is thickened by further cooking to a viscous porridge-like consistency. The finished poison is black and looks like pitch.

278 562 834 [784] During its preparation no woman may come either in the vicinity of the poison pot or in that of the man doing the cooking. The woman who brings food and firewood therefore places these objects within calling distance. They believe that the effect of the poison is weakened or entirely destroyed through the contact or even merely the presence of a woman, whose person they, in their naïve beliefs, are unable to separate from the idea of sexual intercourse -- since the latter, according to their view, is an element acting against the poison. The same would be the case if the wife had intercourse with another man during the time the husband is busy preparing the poison, or if the husband cooked the poison while his wife was pregnant. The [415] finished poison is stored in a wooden pot (madjé) or in a leather bag /347/ (amóta), and, to be sure, like the quivers with the poisoned arrows, not in the hut, but hung on a tree not far from the camp.

/247 cont./

278 415 252 [411] 224 [634] [631] When the cooking of the poison is finished, the pot is cleaned with sand and water and used again for the preparation of food. The arrow point is thoroughly cleaned, heated red-hot, and poisoned anew.

The region in question for hunting has been divided by the El dorobo into definite districts, each of which may be hunted in only the community of its inhabitants. A district, in turn, consists of a number of precincts, whose grassy plains are burned off in a sequence following from their location, the weather conditions, etc. The wild animals then gather to graze on the grass soon freshly sprouting after the burning. This management explains why the hunter is only rarely /248/ forced to return home without booty and why he is able to feed his family continuously and regularly from the yields of his hunting.

The game in general in East Africa is game frequenting the same spot; but the meaning of this statement must be modified in accordance with the relatively enormously large areas here. Just as in Germany a hunter expects a herd of deer at a particular time on a particular knoll, the ol doroboni can quite certainly count on finding the game expected by him at the appropriate time in a region whose diameter amounts to approximately 3-5 kilometers. Considerable disturbances [136] are caused, of course, by the appearance of large predatory animals, especially lions almost always hunting in herds and the hyena dogs always hunting together in larger numbers.

In practicing hunting the men split up in such a way that the younger ones do the stalking on the open steppe, whereas the older ones lie in wait at the watering places of the game. Stalking requires incomparably greater endurance and skill than at home. The ol doroboni must more accurately watch the wind, since his own strong odor makes it extremely easy for the animal to pick up the scent. He must take the greatest pains to conceal himself from the sight of the animal, since he is unfamiliar with any kind of adaptation to the region and the surroundings, so that his black body stands out clearly, even at great distances, on the usually light yellow steppe. The difficulty of the rush is further increased by the primitive nature of his weapons, which permit him to make an accurate shot only at 20 to 30 meters. In what concerns the patience, perseverance, and dexterity that the Wandorobo show in this, a European hunter can

Slat Honey-barrel.

of enemies, which eat either them or their eggs. Three birds in particular are said to be fond of eating bees, a small brown bird called *cephurushew*, a small green bird called *listet*, and a small blackish-grey bird called *mutuhtet*. The *kwoiet* bird (cuculus indicator) cries '*kwe-kwe-kwe*', and when it says that near a tree people know that bees are there; this is the bird which many Africans follow when they are looking for wild honey. The Dorobo regard it as an enemy of the bees because it gives away their natural hiding-places. Soldier ants (*piresik*) eat the eggs and grubs (*sarek*) in the barrels. But no steps, either practical or magical, seem to be taken to protect the bees beyond the observance of certain rules regarding the eating of honey and the disposal of the comb.

The Dorobo say that bees know their owners by the smell of their bodies, and that for this reason people are stung but little when they take honey from their own barrels. But if a stranger tries to steal honey he is not recognized and gets stung badly. People claim also to be able to recognize their own bees; for if, as they say does happen, other bees settle in the barrel along with the original swarm, they can distinguish the original bees by their colour and the part of the barrel from which they come. Whether or not this is true, does not matter very much; but there seems to be some truth in the statement that bees know their owners, for I have seen Dorobo take honey without the paraphernalia put on by a European for the purpose, and get stung but little and with no ill effects from the few stings they did receive.

231

When a barrel is put in a tree in the forest, it often has to be high above the ground, since many of the trees have no branches near the ground, and to help the owner climb a sort of ladder made of a number of thin poles lashed together is tied loosely to the tree trunk with lianas (Fig. 3). To put his barrel in the tree, and to take honey from it, the Dorobo has to climb this crazy ladder which looks as if it would slip or break with each movement, but somehow does not, and lasts, rather surprisingly, for quite a long time. To take honey, the Dorobo makes fire in a loose bundle of tinder. When he has got it smouldering, he takes a bunch of leaves (preferably of *kiliyanut*, tilia sp.) and putting them and the tinder inside his garment, he climbs up to the barrel. He blows the tinder till it gives out a good smoke and then holds it under the

241 [221] The planting and reaping periods vary according as the rains are early or late. Between them there is a time when the crops have to be weeded, and after that for two or three months a time when little need be done to the crops but guard them against animal depredations.

The Dorobo grow two main crops, *pik* or *paisk*, eleusine coracana (commonly known in Kenya as *wimbi*), a short gramineous plant bearing a head composed of small grains; and *ipandek*, maize. Millet had not been [435] adopted by 939 as a cultivated crop, and when wanted had to be bought from the Nandi. As a subsidiary crop, sweet potatoes, *ropoonik*, are grown to a small extent.

[412] Implements are confined to the hoe (*mokombet*), axe (*ndolut*), and ordinary knife (*cambolnet* or *rotuet*), though the use of the *panga* or cutlass [439] is spreading. Hoe-blades (made by Nandi smiths) and *pangas* (sold by traders) are got from the Nandi in exchange for baskets, honey, or skins. The bill-hook, though used by the Nandi had not been adopted by the Dorobo in 1939.

The ground is prepared in the same way as by the Nandi. The top soil is dug with the hoe, collected into small heaps, and fired; it is left smouldering for several days and the burnt earth and vegetable ash are then spread over the plot and dug in with the hoe. Seed of maize and eleusine is [434] bought from any Nandi who is willing to sell it, usually one of the numerous [436] squatters on the nearby farms [10]. The Dorobo get two basketfuls in exchange for one basket. Potatoes (when not got in the same way) are generally grown by themselves, but maize and eleusine are planted together in the same plot so that the eleusine grows up between the maize plants. Maize has thus to be sown wider than is really economic, but it is a Nandi habit, and in favour of it one may say that the intervening spaces are partially covered and thus there is a chance of preventing some erosion in the early stage when the ground is clean, for when the crop is a few inches high, people turn out to weed, a process repeated if the land gets very dirty.

● [417] Each *samba* is surrounded by a fence made of thorns and bushes, with occasional posts to strengthen it where necessary, and trees or stumps are included in the fence when they occur in suitable positions. Sometimes there is a gap formed of movable upright poles, like the gate of a Nandi cattle enclosure, but usually the line of fence is unbroken, and access is by way of a rough stile of logs laid across the thorns.

243 Eleusine is reaped in the Nandi fashion by cutting off the heads with a knife, the straw being left to be trampled down and eventually dug in — that is, if the *shamba* is to be planted again. Maize is picked by hand, but in 1938 it was largely eaten on the field as the cobs developed, so that by the time it was fully ripe there was not much left to reap. By 1938, however, some [427] Dorobo at Ilpukua, noticing the European practice of stooking maize in rows before it is ripe, cut and stooked their own in the same way, though they did not understand why it was done by the Europeans, whose object

[10] A squatter is a "resident native labourer" living on a farm under contract with the employer.

[P. 196, A]

Economic life to-day is centred more and more on the *imbaret* than on hunting. 241 423

The family group is interdependent: the men trap, make tools, protect the family; the women look after house and children, and prepare food; the children, while dependent on their parents for existence, help them with the *imbaret* and live-stock, and in various other small ways. 592

There is little specialization, since all men can make traps and honey-barrels, and all women can make baskets. Joint-production occurs in (1) house-building, when the whole family takes part; (2) cultivation; (3) in hunting and in digging coloured earth. Food produced by the family is shared by husband, wife, and children, and also by the husband's and the wife's parents. Meat caught by trapping is divided between the trapper's family and the other people living in the settlement. Vegetable foods are not shared thus, since they can be got by all. Hospitality is given to visiting relatives, clansmen, age-mates (though they do not sleep with their host's wife), and even to stray travellers, once their good faith is established. Beer is drunk at social gatherings of men or women, at clan councils, and on ceremonial occasions. And just as meat is distributed in a particular way (p. 193), so with tobacco: a man who acquires some gives it first to his father, then to his wife's father, and lastly to his brothers and clansmen, if it will go as far. [467] [342] [241] [224] 592 421 [224] [244] 574 273 276 [431]

The typical Dorobo hut, *kachonget*, is extremely simple, being no more than a framework of sticks covered with leaves, and a hide on top. They are now building larger and better huts of Nandi type, sometimes with unplastered walls; and an intermediate form may be seen, with a nearly flat roof. 342 [171]

D. THE MAGICO-RELIGIOUS ASPECT OF ECONOMIC

That the Dorobo had hunting magic is certain: old men say that some had it, while others had none; my friend Arap Minig, for example, says he was one of those who had none. Since hunting is the one phase of Dorobo life that appears to be gone for ever as a result of government action (in spite of sporadic individual activities), this 224 [178] [48]
[illegible] almost is, I fear, irrecoverable.

423 /260 cont./
The individual person does not have an exclusive right to land or to the use of hunting grounds. Rather, both are common property.
224 Only one half of any slain game down to the size of a medium ante-
•421 lope belongs to the hunter and his campmates together, while the other half of a male animal is given to the members of his lineage, those of a female one to the relatives of his wife or wives: in both cases: insofar as those entitled to receive it live in the immediate vicinity. Of the two tusks (ligatok, ligasch) of the elephant each
[178] receives half. Recently, the large teeth of the hippopotamus have been shared in the same manner, whereas formerly /261/ they were left lying, along with the bones. For the horns (hadong, hadama) of the rhinoceros the hunter receives in exchange poison or arrow points and then distributes these things among the people who previously were to share the meat of the animal. The hides of the slain game belong to the hunter.

All smaller game belongs entirely to the hunter and his campmates.

421 Property belongs to the single individual, not to the family
425 community. A lost article is returned to the owner, without the finder's claiming a reward. There is no punishment for the appropriation of found articles.

43 There is no general medium of exchange. Money has not yet been adopted anywhere. Goods are always exchanged for goods. For ivory the caravan people pay cattle, goats, sheep, iron wire, beads, fabrics. In the individual barter transaction the Wandorobo never want one kind of goods above, but always several, and of the inanimate ones as many different kinds as possible. The exchange takes place with immediate delivery and is made valid by spitting on the objects. Only exceptionally is a brief delay granted for a
452 small part of the payment. The creditor seeks to have himself paid
426 by a dilatory debtor through self-help, and only if he has no success with that does he make a complaint. It not infrequently happens
[583] that the creditor takes a small daughter of the debtor as security, and a marriageable one as a wife; in the latter instance, he deducts the amount of the debt from the bride price. The debtor's heir is liable,
[672] and, to be sure, for the entire debt. With the debtor's inability to pay, the warrantor is liable, if -- which is seldom the case -- one is present at all. The heir of the warrantor is also liable.

6:Huntingford E-5 (1938-1939) 1953 FL6 Dorobo FL6

described as *cwaaswaaswaut*, i. e. narrow-waisted; she is bigger than the others, with a large head and body and no sting. The workers, called simply *sokowik*, "bees", are considered to be males[8], and the Dorobo say that all the male bees in a swarm fertilize the queen. The queen lives inside the swarm surrounded by the bees, and never goes outside it, being fed by the workers with the honey they make, and she lays her eggs in the fresh combs before any honey has been deposited in them. The workers make honey, according to the Dorobo, by eating the 'water' (*pek*) of the flowers, which they vomit into the empty combs when they return to the swarm[9]. A comb is made (or built, *ter mpoisiet* — build the comb) by the mouths of the bees with the help of another substance which they get also from flowers; and from the same source they get wax (*lomwoiet*) which they bring in on their feet, and use to close up openings in the hive[10]. This is what the Dorobo say. The drone, on the other hand is considered to be a female which does no work and has no sting. The drones just fly about "playing", and as far as the Dorobo can see perform no useful work. They just eat up the honey and after a time the workers kill them, *kotil kakit*, "they cut their necks", so that they shall not eat the whole supply of honey[11]. Terms used to describe bees are:

Kemet — queen (lit. mother).
Sokowik — workers (sing. *sokowiat*).
Kapuswik — drones (sing. *kapuswiat*).
Uswik — young bees, grubs (sing. *uswuet*).
Okdoiyet — swarm.
Mpokiet, *Wawoiet* — Empty comb, either new and unused, or old.
Kipiroitiat — comb full of honey.

The Dorobo seem to have no idea of the length of a bee's life, which in Europe may amount to some seven months in the case of bees born in the autumn.

231 [422] [426] Honey-barrels or hives, *pesuet*, are made of slats or of hollowed-out logs and placed in trees for the bees to swarm in. Once a swarm has entered it is considered to belong to the owner of the barrel. If it stays for a long time (the Dorobo say) it may be inherited by the owner's son; but if it should go from one man's barrel into another's, nothing is done, for though the Dorobo say that their bees get to know them, they do not claim to be able to control their movements. And if a swarm deserts a barrel, the owner just [423] waits till another swarm comes to it. The commoner type of honey-barrel is

[8] The workers are really females whose ovaries have become modified so that they do not normally produce eggs.

[9] This is not very far short of the truth, for bees take into their crops a substance called nectar from the flowers and deposit it in the cells. By the action of their saliva, which produces a chemical change, the nectar becomes honey, and is regurgitated into the cells for storage or for feeding the grubs. (Cf. article *Bee* in the Encyclopaedia Britannica, ed. 14, by Prof. C. H. Cheshire.)

[10] Wax is really secreted by special cells in the abdomen of the worker bees.

[11] Drones are in reality the males which mate with the queen. When the mating season is over and food is getting scarce they are killed and thrown out by the workers.

/234 cont./

231 322 [412] the first consists of the ax blade stuck into a wooden handle like a knife and is used as a paring chisel; the other is a hollow chisel (nja) with which one smooths the tubes on the inside. The two openings are closed corklike by flat wooden covers fitting into the opening, into each of which two holes permit entry for the wild bees. For hanging, one puts around the middle part two loops twisted out of lianas, which are connected, handlelike, by a plaiting of lianas, like the straps of a holdall. The beehive is picked up by this handle with a hooked branch, at the upper end of which is lashed a second one with a hook on top. With the latter the whole thing is hung in the branches of taller trees. On the side hanging downward the beehive bears an ownership mark. As a rule it is the same as the one that is burned on the long tang or on the extension tang of the arrow point. On the beehive one finds it either whole or only its lower part. Before the honey is removed /235/ the bees are driven out by a very smoky fire kindled under the tree (1).

231 [283]

411
[439]

rarely also make themselves, as a rule has the so-called arrow shape. It bears either a short, flat tang, which is lengthened by insertion into a cylindrical one ten centimeters long, or else the latter and the point are worked continuously out of one piece. Now an and then one also finds arrows among which the extension tang is made out of wood. These come from Ukamba, where the Wandorobo, who call them mijeki, have bought them. The tang is stuck loosely in the arrow shaft so that the latter can fall off when the animal has been hit. Less frequently they use wooden throwing-spears (Fig. 88) with a loosely inserted, poisoned iron point, which, like the arrow point, remains sticking in the animal hit, while the wooden shaft falls off. They also attack the sleeping rhinoceros and hippopotamus with a sharp sword, which they tie on a stick and use as a thrusting or throwing spear. One leaves this weapon sticking in the wound so that, if the animal flees, it cuts the entrails still more by sticking on the ground and against the bushes. Both types of spear are called mwariki. Both the point and tang of arrows and throwing spears bear a filed-in ownership mark (Plates 5 and 6), by which one can recognize tribe and lineage of the owner, in order, upon finding a slain head of game, to determine its hunter. Like the ownership marks on the cattle and donkeys of the Masai, the symbols here are not the same for all Wandorobo, but vary more or less in the individual

/340 cont./

422 districts. Besides such exotic use also finds /340/ others that belong to individual large families and are then used in place of the former, not together with them. The point and tang of the arrows and throwing spears are always smeared along their entire length with a plant poison, which the Wandorobbo themselves have out of the wood and roots of the Acocanthera abyssinica, which they call ouba, i.e., poison (1).

000 1. Prof. Dr. L. Lewin, Berlin, produced a glycoside, amorphous ouabain, from Acocanthera wood that the author sent to him, which shows the following characteristics: it tastes bitter and is copiously soluble in cold water; Drehung /rotation/ $[\alpha]_D$ ca. $-$ 38° for a 2 per cent cold dilute solution; it expands at 184°C; it has the per cent composition C_{30} H_{48} O_{12}; it is precipitated by excess of caustic dissolved in concentrated sulphuric acid, it gives a quickly arising and strong fluorescence in green. -- Prof. Dr. E. Fraenkelmann, Berlin, clinically tested ouabain for serious heart ailments and expressed himself, among other things, about the results as follows: "Ouabain is easily soluble and I took advantage of this circumstance to inject it subcutaneously or intravenously. Injected subcutaneously or intravenously in a concentration of 0.3-0.4 mg. of ouabain three times daily in the above concentration, I have so far obtained in the case put among my heart patients a very prompt, excellent result in the direction of digitalis, without unpleasant side effects. If the experiences up to now continue to be equally favorable -- and I have no reason to doubt it -- there would

THE DOMINI OF THE NORTH TINGREE FOREST (REPRINTED)

HISTORY

[13] 5.4 Over two millions of the South, West, and Kilvary, as well as of the Eastern Semenfore, that the Dombo (whatever that origin) were living in the Kaspa Highlands when the Wild Dombo and Dusky arrived there. Soon west of the Dombo border lived an Ipsel people under the British Administration became Native Reserves (Native Land Units), the land rights of these groups were accepted as far as mere domicile was concerned. But the records Dombo, including the Eighteenth, occupied land which was excluded from Native Land Units and became entirely Forest Reserve; hence their land rights were not considered.

[14] About 1927 the Government began to investigate the possibility of removing these Dombo, largely on the grounds that occupation of Forest Reserve by nomadic peoples was undesirable, and in 1937 the Eighteenth, the principal family involved, were transferred to the Ipsel Land Unit. This move was not successful, for within a few months most of and all of them transferred had crept back to the edge of the North Tingree forest, their old home, where they were living precariously when I did field work among them in 1938-9.

DEMOGRAPHY

[15] The Eighteenth Dombo of the western part of the North Tingree Forest Reserve numbered 204 when I made a census of them in 1938-39. Since part of the family was no longer, or formerly, living in the forest, it was found necessary to classify the people according to the nature of their domicile at that time, and this resulted in the distinction of four " domicile categories ":

[16]
- A. Inside the forest, on an altitude of 6,000 ft. and over.
- B. Fringeland on the edge of the forest, mostly between 7,000 and 6,000 ft., and within a mile of the edge of the forest.
- C. Fringeland on Ipsel Reserve (Land Unit) within 10 miles of the forest in natural conditions generally similar to B, but sometimes at a slightly lower altitude.
- D. Distant exiles, i.e., the Kaya and Kwanapa Land Units, and Lebigbo; in the first two there is country similar to C.

People placed under C and D were still considered to belong to the family, and were regarded as members of their original domicile (band), and accordingly the census can be analysed (1) by domicile, with domicile categories, and (2) by domicile, according to sex and age:

(1)

Domicile category	Eighteenth	Kwanapa	Kaiyan	% of total	Totals
A B C D Unknown	48 48 8 8	38 38 8 8	48 48 8 8	48 48 8 8	38 38 8 8
	48	38	48	38	38

THE OVERDUE BOOK SYSTEM

other accounts. Therefore, all lending activities are carried on illegally with the risk of being punished if caught by the police.

Proposals on the two well-publicized issues centred in a system. Fishing was used to gain grain and to evade spillages. Spears have since been used. The Overdue Book is more lending days, but in the Public Overdue Books the trend appears to have died out, though it existed in 1939. They have two kinds of bag: 1) The all-bag system, currently used for tickets, consisting of a gift 2-3 bag, 3-4, cards, and 4-5 bag, only smaller tables are in the kitchen. 2) The package of every pressed, which contains tickets, of a package each book card, with a small attached to a compartment with a platform. An atmosphere is such that when an upland mouth on the platform to hold under the stone, and the presence on the platform ensures the package stay, which then by tightening the stone and holding the upland compartment. Each single can be easily to lift from the platform. The card is used mostly to avoid overflow, but frequently have been sought to them. Overdue bags with a drag-spoon also are used for the Public Overdue.

The only lending when recorded is that the night before to give one lending to some more streets from which information. This does not apply to the setting of bags.

On March last night, the town was divided into districts, many of Yarmouth, and in the district each man had an identifying block of land to attend to towards an angle, from the lower-levels, and collected with him. Occupation rights were recognized by public opinion, and trespass on a man's land only by... Difficulties arose in some lending without permission of the possible of a piece of work, might result in the trespasser's stock or the family of the owner, who would have him to any compensation for trespass. Theft of grass from a hay is well-spread to have followed, and only because the land might be taken, but because the fully dealer would in a great use and to evade the plan acting were stolen from a dog.

Cows

Cows is to the Overdue what milk is to the Dutch. A 2) "overdue" and the monthly dairy by gathered by the disposition of calves. A cow and herd would sell for either on the open day, a house (though most may be sheep), sheep, a cock a pigeon. I keep by monthly tickets to the Anthropometric and other lending books. Nobody knows the books in books, and also the Public by making these with books.

The Overdue recognize four varieties of cow, adapted, by many purchasing small stock, animals have placed this in many thousands, each have, which from to the ground and fatherland, means here which has by milk much of gold and products of small cowshed together by their own calves. The Overdue divide the lending here, ordered, one have cows, the gentle, horse as ordered. "the number of the here", the ordinary, other sheep, produce, cooperate to the dairy, which make money by using the "one" gold of thread and here nothing I can, the sheep, which, cooperate and the Overdue, fragrance, cooperate to be the Overdue which be nothing using.

Cows or heavy-horned diseases are much other of that of wood and together, with sprains wooden partnerships on of the two halves of a piece of the gold bread sufficiently and and together. They are on a cows and small a and this, to give the the stable with the here, to a that-pinched many to cows and sprays to. Such goes, from all the country, cows take and, and give to money, gold to money. Now are and a recognized that cooperate by have only much, and of and they, when other taking money. Carrying taking there, that and appears to be a gradual or threatening glances to the Overdue, would. Might of horse here a very cooperation for livestock.

Cows is an important period to Overdue economy. 2) 3) cows a book, much are an allowance, when the most gratification, and a horse on which of consistency.

THE ORIGINS OF THE DORIS CONCEPT PROJECT

Introduction

The Doris began in response to a small area about 30 years ago for what a [illegible] and at that time grew very slowly. Though this settlement was [illegible] to become quite crowded, conditions were unfavorable to the development of cattle [illegible] as a primary activity and they have been forced to make agriculture a [illegible] however, for the country, neighborhood, and even the most part of this, they [illegible] have been involved in the Doris.

Land

There who live in and 8 Doris's categories (with whom there are not [illegible] areas) cultivate small plots in the open land which surrounds the town. They have no rights of tenure, except the temporary ones acquired, according to Doris law, if they live there as squatters under the Squatters Rights (Occupancy) [illegible] Those plots, however, all permanently range in size from one acre divided into five [illegible] agricultural holdings. At half an acre divided into four holdings to other cases, plots of a quarter to one-fifth of an acre worked by one person. All plots are fenced, and [illegible] a living but a half inside the fenced area, economically it may happen that elderly Doris who allowed by Doris squatters to have a small piece of their own [illegible] land to work.

European farmers in the district, with whom the Doris had practice may the [illegible] attempt was something to do the Doris the settlement of this land was, [illegible] they gave an income, but the government authorities brought pressure, and the practice of a Doris who did not choose to become a squatter in order to live on [illegible] to consolidate the area land was then prevented.

Cultivation Methods and Crops

The main crops are grains, chiefly, [illegible] and maize, [illegible]. Other [illegible] are [illegible] for [illegible]. Though they bought a [illegible] from the Doris. Some [illegible] apparently are sometimes grown in very limited quantities. Implements are the hoe, [illegible] hoe and the panga or cutlass, both obtained from the Doris. They have also small axes, adzes and knives, either or [illegible].

The planting of crops is dependent on the first and are adapted, [illegible] from [illegible] to March, and reaped from April to September. The land is prepared between January and April, and planted in April or May according to the rain. Cultivators follow the Doris method, with planting and hoeing at the end. The [illegible] of [illegible] and maize is bought from the Doris, usually from [illegible] living nearby. Maize and [illegible] are planted together in the same plot, though [illegible] are generally grown separately. Planting is begun in the Doris season by making [illegible] the [illegible] seeds in pockets by hand. Cultivation of Doris crop are [illegible] much, but are rather [illegible] of the plants are at least four feet [illegible] a few [illegible] generally, both on that is not worth of the Doris are to plant the one with maize. Cultivation [illegible] are roughly grouped as [illegible] or [illegible] to the Doris [illegible].

Food

Food is the [illegible] most important source of meat supplemented by beans, and vegetables, and grain bought by exchange from the Doris. The Doris supply a [illegible] with beans as their main agricultural produce, supplemented by [illegible] grain they may sell by [illegible] other foods from they can be got. Meat is [illegible] by [illegible] [illegible] by hunting, a [illegible] by Doris of [illegible] [illegible] [illegible] and [illegible]. Some [illegible] are [illegible] [illegible] [illegible]

THE KINDRED OF THE KWEE VIRIDANT FOREST

Know ye which the Kwehn are mighty small ones: (1) the hobbamokko, whose a small warrior; a Kwehn girl has taken over the powerful Khadi governors of [illegible] and she, and a varying number of gods. When a Kwehn boy reaches [illegible] Khadi gods he has to test himself by the hard command of gods. (2) the gift exchange: a Khadi godess travels with a Kwehn, seeking to get horses, and what the boy has [illegible] something he has taken, the Kwehn gives that one. Then the Khadi gives a gift, and the way is then paved for the exchange of gifts. The exchange is independent of the money which is given by the Kwehn from time to time. The ground of exchanging gifts is of course a form of payment, but it is purchase under the peculiar conditions of having a friendship for a previous exchange of gifts so the Khadi do not readily part with their gifts, and it is necessary to have gifts of the right shape for a propitiatory exchange of other things. So for the Khadi have long talking of exchange back and forth, and it is very rare to get even the Kwehn boys [illegible] to talk on hobbamokko. (3) The Khadi will not permit the exchange of gifts [illegible] with gods. The Kwehn do not make or value things they had made or [illegible] their own virtue. I first came there in 1927.

Government

The general rule is that elders [illegible] more than the gods by the rule by handing down of the traditions of their own people, or they [illegible] to them by genius law. Where a town has gathered with one [illegible] with the Kwehn, the Kwehn's brothers' sons, or the Kwehn's brothers' sons. Whereas the son inherits [illegible] death. Land rights in the Kwehn pass to the eldest son, or to a brother, or to one of the adjacent female ancestor [illegible] 1 (2). Whenever one [illegible] a brother, or a daughter, or to a [illegible]. Rings are [illegible] to sons, or to brothers or sisters [illegible]. Cows are divided proportionately between sons, or [illegible] to brother or daughter. The proportion is roughly as follows: considering that 2 cows are worth [illegible] and three sons: 2 sons are, then, a married son, one a youngest son, one a [illegible] son, this goes to offspring going eventually to the youngest son. The household division of cattle is approximately thus: to eldest son, two; to other sons, one each [illegible] son, others divide to the youngest son.

Division of Labour

Everything connected with hunting, farm and transport is done by men; domestic [illegible] work by females. The main occupations are divided thus:

Men	Women
[illegible]	[illegible]
[illegible]	[illegible]
[illegible]	[illegible]

3:Huntingford E.-5 (1921-1928)1929 FLA Dorobo FLA

together. The rim is made of a single stick bent in an oval and the ends bound together; across it are fastened pieces of tree-rope.[1] Griddlestones (Sotta, X.) have already been mentioned.

The Dorobo have no knowledge of metallurgy, and they have no smoked instruments, pottery, or, apparently, objects of ivory. Metal-work and pottery they buy from the Kavirondo.[2]

Trade and Commerce.

Trade is by barter. The Dorobo give the Kavirondo baskets, dressed skins, and bows in exchange for basswoods, tobacco, pottery, beads, and other ornamentation which they procure previous themselves. There are no special market-places, but goods are taken to any place where there are Kavirondo, and there exchanged.

Land.

(i) *Powers.*—The forest is divided by the elders into sections, and each family has its own section of forest. The boundaries between family holdings may be parts or rivers.

(ii) *Geographical Divisions.*—The Dorobo divide their country into divisions called *kwet*, pl. *kwenuk* (X.). The chief divisions appear to be called Kipkoiwon, Mirua, Kimoringo, Sosiyo (Sambur, X. *sotua*), and Mokopiek. The majority of the present place-names are Masai.

The points of the compass are called as follows:—North and South: Muret (X.); East: Tororiot (X. *sotua-kwenet* = up). West: Tu'ukuk (= where the sun descends-direction).

(iii).—Government.

The Kimalilo-Kipkoiyoiwek Dorobo have now no chief. The last to hold office was Parkipiroi[3] arap Ngondigan, who was killed at the time of the South Province Expedition, 1918. He is still alive, though he no longer holds office. The chief was elected, and the office was not hereditary. The chief (*kenogindet* (X.)=counsellor) was chosen for "*kipkoyoiyo lolio*" ("*kenogu only*" = sense, ability and position). The only form of Government that exists now is a council of elders (*kenogu ap gaisandi*, X.), who meet and decide on matters which are brought to them. They seem to have little power of enforcing obedience to their decisions, though they claim

[1] This is described and illustrated, although it is a Ponde one, above 9.9. does not mention it.

[2] For the use of terms, see X. "*Kwenkwenuna*" There are hardly to considered as terms-terms of trade.

[3] X. = *Kwenkwen*.

gaining his position through the tacit recognition of the people. The Isenye Dorobo consists of a loosely integrated group of districts held together partly because they "are all Dorobo", but much more by the clan-solidarity which extends across the district boundaries. The clan is thus a far more important institution than it is among the Nandi.

The Dorobo are a hunting people who have been forced to take up agriculture, and at the same time are in process of acquiring a small amount of live stock. A great deal of their culture and most of their language have been borrowed from the Nandi; but their habits and mental characteristics are their own, including a "hunting outlook" which contrasts with the "cattle outlook" of the pastoralist, and a feeling of sympathy with wild animals that does not exist among either pastoralists or agriculturalists. Meat is important to hunting men here, and honey is regarded much as pastoral people regard milk.

Although the Dorobo are commonly thought of as a people who wander at will wherever there is game, this notion is true only to a limited extent. Parties used to go far afield in the old days seeking game outside their own territory in the sparsely inhabited areas of the highlands; but their own forest was and still is divided into strictly observed economic areas where are family holdings to which people hunt, set traps, keep their bees, and collect vegetable food. These areas may look small on the map; but anyone who thinks that half an inch on a map (representing perhaps one mile on the ground) across a very short distance, will find when he gets to the forest that one mile on the ground is a very formidable tract offering all sorts of possibilities for the hunter, and infinite chances for the stranger to lose himself.

4:Huntingford E-5 (1938-1939) 1953 FLA Dorobo FLA

Fig. 6. Plan of a Dorobo thumbo at Kaigut showing a Kwak thumbo.

at Kipsikau in 1938 the crop was so much damaged by monkeys, pigs, and a sort of mole called *kwanat*, that the original thumbo had to be given up, and the occupiers took up new and separate plots elsewhere. Sometimes a Dorobo has a thumbo all to himself; more often, however, several people divide the area beside a town, each contributing to the labour of making it, and in some cases Dorobo share part of a kwak thumbo with Kwak (Fig. 6).

Though not connected with cultivation, we may mention here the subject of earth digging, because it is concerned with the ground. Red and white earth is found near Timboroa (or Tambaroa, as the Dorobo call it), and men go in parties of four or five to dig it. They use nothing but a digging stick, *kwost*, made of a sharpened stake, and the earth is carried home in large leather bags. In former days, when other Dorobo lived in the earth-producing area, a digging party would ask leave to dig from the man who owned over that tract of land, and though as far as we know no fee was paid, it is said that if a man should refuse his consent, the party would go home without digging. But as no Dorobo now live there, this could not be verified. Today the Dorobo sell coloured earth to the Kwak, who pay them at the rate of 1 shillings for a large bag of earth. Red earth, *ondeti*, is used mixed with fat (or sometimes cream of) for rubbing on the head; white earth, *cwonit*, is used as a magical remedy in cases of homicide.

(c) Cattle

If the Dorobo had ever been in such close contact with a people whose primary interest in life was cattle, it is possible that they would have concerned themselves with agriculture and cattle themselves. But their relations with the Kwak have inevitably led them to take an interest in cattle, and to think that the possession of cattle is a desirable thing. Therefore they are slowly trying to acquire cattle, and are in process of making them their ultimate objective. But

[illegible] mixed in the event, but they are used even to-day as much for medical and magico-religious purposes that there is a constant drain on them.

The numbers that I actually counted in the three forests of Kipkenon, Kelyet, and Tendeye were:

		Cattle	Goats	Dogs
Kipkenon:	Ang'Kotor (Cannon2)	10	—	—
	Ang'Mosoit	—	10	3
	Ang'Kamara	5	—	—
	Ang'Mokte	—	5	3
	Ang'Kotor (Kipsaat)	5	—	—
Tendeye:	Ang'Mibelio	20	—	—
	Ang'Kaat	3	—	—
	Ang'Ngeiya	—	—	2
	Ang'Cumiya	1	—	—
	Kibon ang'Obon	15	—	—
	Kiptaiwa ang'Mungoma	15	—	—
	Kiptoo ang'Ngomomin	—	5	—
	Kiberio ang'Lungat	—	10	—
	Kimilo ang'Ngomomin	—	5	—
Kelyet:	Ang'Mutoko	5	—	—
	Nomoyoi ang'Turor	5	—	—

3. The Economic Division of the S.W. Corner of the Forest

● 913 The forest is regarded by the Dorobo as their special territory. Not only is it divided between the lineages, but families have rights over parts of it, and these rights pass from father to son. The place where the river seems to set twice a natural boundary and within that boundary are Dorobo ground where the strangers, except the occasional settler or fugitive, cannot to penetrate. A man's forest rights included hunting, trapping, setting honey-barrels, and food-gathering. If anyone wished to do something on another man's ground, he might do so with the occupier's permission. A portion of forest was not the absolute property of an individual and rectified by a pronouncement of the local council, but was held on a tenure based on the fact of hereditary occupation exercised by public opinion. A man's section may conventionally taken over by his son and this succession was recognized by the people.

[illegible] The forest appeals to the Dorobo in two ways. (1) As the trees [illegible] fruit bees, and they have an manner of living in which there were [illegible] trees therefore go with the land, which in fact does not count as land [illegible] a man's section in the new effect, but if people should begin to cut down many trees, public opinion would be against them. <u>[illegible]</u> [illegible] as one, wooden (Nkol ebit). "If a Dorobo wanted to cut down many trees, he

Schmidtgood K-1 (1938-1939) 1953 FLA Dwarbo FLA

other Dwarbo would not like it", in the words of one old man. (3) The animals on whose flesh they feed and with whom they themselves have something in common, live in the forest. (3) In the trees live the bees whose honey they eat and drink, a substance so valuable to them as milk to the Masai. (4) The forest is not only the medium of their life, but their protection. And so even to-day when they can no longer live in the forest, they still think of it as their own, and the division of the parts lands which they have made their settlements is of the utmost importance to them.

The division of the south-west corner of the forest between Kipkoren and Sawiyo as it was in 1939 is shown in the Map. The forest is here divided into several unequal areas, bounded on the NE side by the main through-track from Kipkoren to Sawiyo, and crossed also by the other through-track from Kipsibon to Sawiyo. The main track is used a good deal by the Masai who go to see their friends and relations on the farms in the Mokotot valley; the other track is used mainly by Dwarbo, and their honey-barrels and traps are mostly along it, whereas there are none on the main track because strangers might interfere with them.

Between the two main tracks to the SW lay Tiwet, a stream which forms the northern boundary of the area held by the Kapkeldon (I), Kapsiwan (II), and Kapsingiro (III) families, the last of which extends eastwards to the main track. Group IV 1 is represented by Arap Kiton, Kipsaigei, and Kipsaa, three brothers; IV 2 by Arap Mosir; and IV 3 by Arap Siagiro. The occupiers of I and II live at Kipsibon, and of III at Sawiyo. The SW lay Tiwet is the southern limit of the area held by the Kamara (IV) represented by Arap Kamara who lives at Kipkoren, his land reaching to the main track. East of the main track, area IV 5 is held by the Kapsomoito family represented by Arap Cowiyo and his brother Arap Lopmaito who live at Nibenton. Above this is area IV 11, held by the Kapkeben, represented by Kiptaiwo who lives at Upper Sawiyo in the forest. And finally IV 12 is the reforestment area, occupied by the people who live at Upper Kipsaybon in the forest and Lower Kipsaybon outside it. There are a minority of six families - Kaimosonik, represented by Toll - Kamarnos, represented by Kebet - Kapkenagon, represented by Kibenya - Kapkimomoni, represented by Arap Kwat - Kapkiyego, represented by Kipkoe - and Kapkeldon, represented by Sella.* These holdings are due either to gift (except in the case of IV 11) where four clans are represented, and the division could not be satisfactorily made)

I	Family Kapkeldon	
II	Family Kapsiwan	Clan Kor
III	Family Kamara	
III	Family Kapsingiro	Clan Kipsibon
V	Family Kapsomoito	Clan Kipsaron
XI	Family Kipsaiwo	Clan Kipsaiwo

* The prefix Kap-, besides meaning "place of", also means "family of", and is used as the name of a principal male ancestor, who may be a mythical figure, e.g. Kapkeldon = descent from Kibet the wife of Arap Kiptoo's father's father.

It will be seen from the map that honey-barrels and traps are the main forest activities, the **shambaa** being outside the limit of the trees.

The Dorobo had developed a habit of saying that there were no honey-barrels in the forest. Certainly this would seem to be true to anyone who goes through the forest along the main track from Kipkoren, for there one sees no signs of any activity at all. But on the other track, where few but Dorobo go, one are plenty of them, especially in Area I where Arap and his brothers are very active, several of the barrels near the path belonging to the convert half-brother Kiyangi. In Area II there are not so many, because the Mzee regards himself as an old man by now, and unable to work nowadays in actuality — in 1939 — about 60); his brother Arap Rato works on foot and is less active in the forest than Kiyangi. But Arap Mzee has about two honey-barrels, which he showed me, as well as a trap in which subang before he had caught a bushbuck. A few paths branching off the main track which had once led to traps could still be distinguished, though they were not used in 1939. In Area III there was a new path leading to a trap set by Arap Yagira some way from the track. In Areas VI and VII are all the people still live in the forest in the old type of Dorobo hut, the **ingat**.

Now the areas are not very extensive. The space of forest occupied by Areas I-V is perhaps not more than six square miles or thereabouts, and that of Area V and VI may not be more than four square miles. But a mile on the map a very different thing from a mile on the ground in an African forest. The tracks have been forced by economic pressure to concentrate; and since Independence, even on a small scale, of agriculture, the dependence on hunting is naturally been reduced. In addition to each forest area must be reckoned the strip of open land where they live, cultivate their little shambas, at least their few livestock. Moreover the central and unoccupied part of the east is open to anyone who chooses to hunt there, though there were no hunters in 1939 that they actually did so. In the old days the forest peoples have been larger, though when all the forests were occupied there certainly have very much difference in size. But a relatively small area is ample for bee-keeping, trapping, and food-gathering, and it must be remembered that in the past, before the forest people's economy was disturbed, they ranged much further afield to hunt with bow and arrow than is possible today, while forest was primarily regarded as a trapping area. Various statements are no doubt that the Dorobo used to hunt right over Uasin and Uaso Nyiro, as well as in the high country east of Timboroa. Though thereby hunting was limited in extent, their dry weather ranges [illegible]

* This paper deals with conditions that existed up to 1939; the use of firearms must be taken as referring to that period.

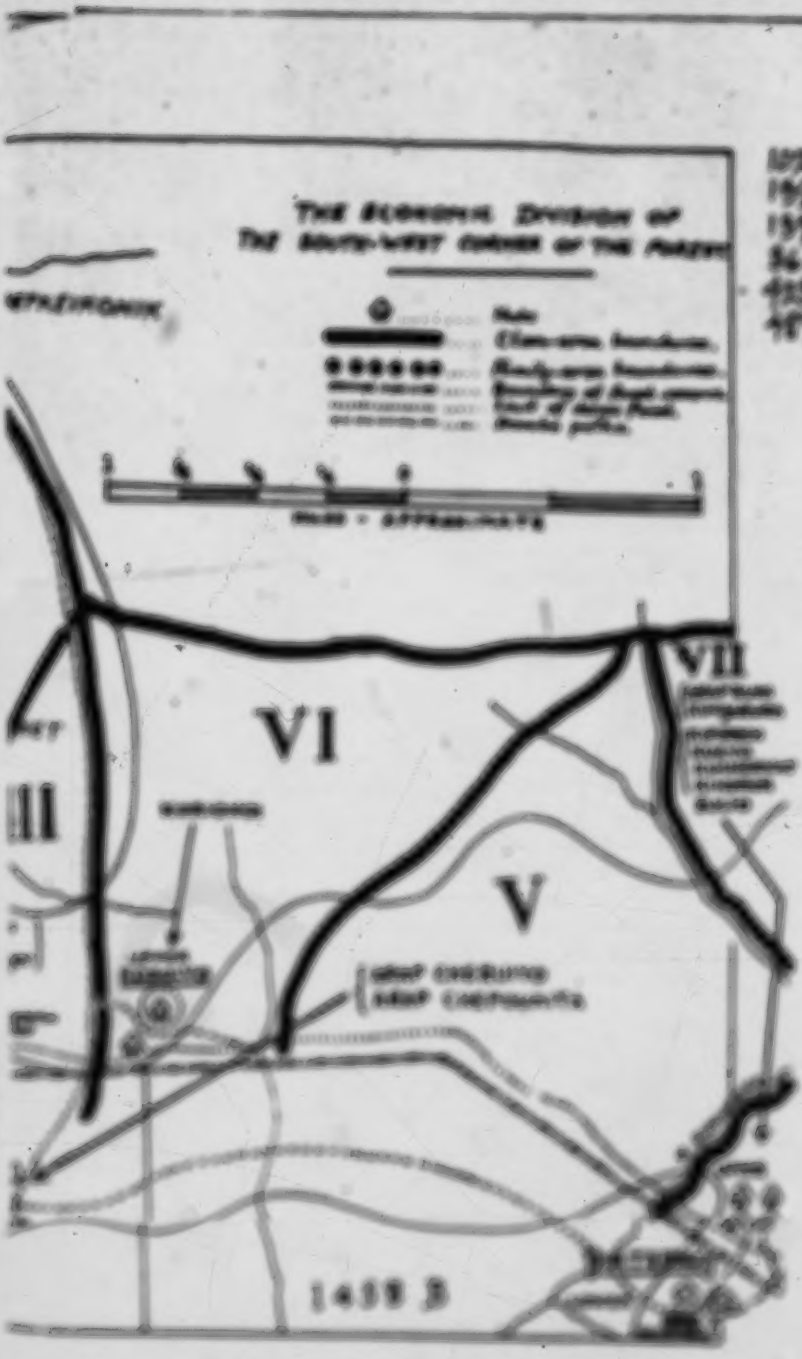
Huntingford R-5 (1938-1939) 1953 FLA Dorobo FLA



Both the social and the economic ranges of the Dorobo are very narrow. The family is a self-supporting unit, and a group of families forms a social unit; but the group is isolated, and the groups cohere through their strong clan solidarity and strict exogamy. There is no "tribe" as e.g. the Nandi, but a collection of family or clan groups forming a band or district, and a collection of such groups within a given area having a common organization, customs, and dialect, and the latter also that "we are the Dorobo of such-and-such a place." Thus the Kapchepkendi Dorobo (with whom this paper deals) distinguish themselves from the Dorobo living on Tinderet hill, though that hill is only some seven miles from Sawiyo. (See map of the Dorobo country.) Before the Government dispensed them the Dorobo possessed, more or less undisturbed, the whole of the forest. Now they have no land at all. But they maintain their solidarity in spite of disruption, by means of their isolation, strong clan-system, and the fact that outsiders, e.g. the Nandi, are half afraid of them (as long as they do not go into Nandi), as being ventriloquists and magicians of no mean ability, a people who are, in fact, somewhat uncanny. Their external relations may be described under three heads as (1) agricultural: exchange of goods and services with the Nandi, and, till about 30 years ago, with the Trans Nzoia Masai; (2) restrictive: the Government calls them (or used to call them) their land, which leads to (3) an attitude of distrust towards all Europeans, though they are driven by economic pressure to work for them.

Productive activities are concerned with the following:

A. *Food*: meat (by hunting and trapping), honey, wild plants, roasting and water (grown or obtained), milk, maize meal, salt and fats.

B. *Necessities*: houses, weapons, implements, utensils, clothing and ornaments (except of iron), firewood, cups, honey-barrels, cultivated seeds (which is dug in the eastern part of the forest and sold to the Nandi for cash).

C. *Raw Material*: wood, plants, and skins.

The exchange of their own products for things they do not make is governed by natural economic

hunted by concerted action, and still are, to a [illegible]
limited extent, by individuals, as will be several species of monkey.[1] There seems a have been no very strict close seasons, as pig are occasionally hunted in the wet weather, though not often, since the forest is difficult to traverse when wet. There are now no lion or elephant, as they are said to have existed when the foremost Kipkoris men were young men, i.e. about 1860. [193] Leopards are still common, and so still about if one runs up a tree after being put up by dogs. [231] they are sometimes caught in traps made of wire, which is now bought, but sometimes we make them home. However, a trap recently was long illegal which caught a leopard during one of my visits was said to be exceptional. Buffalo no longer exist in the western end of Sotik where the Kapchepkendi live, but they occur near Londiani, a few miles to the east.

Hunting parties varied from two + eight men. If, say, eight were out, half would go along one bank of a stream, and half along to other bank, so that one or other party would [illegible] to get something. They met after the kill and cooked the meat and the meal of it on the spot. [364] The kill was DIVIDED among the hunters and taken home for their families, the successful members of the hunt receiving a share from him who made the kill. The hunter has to provide not only his own (monogamous) family, but also his father, mother, and wife's father with one, and the distribution of meat is under of priority, i.e.—

Hunter: Meat to

1. Wife and children,
2. Father and mother,
3. Wife's father,
4. Neighbours (sometimes).

A man has (or had till they were taxed by [illegible] government) no hereditary right over a piece of [illegible] [231] [illegible] [236] trapping, and food-gathering. Other people who wished to hunt there asked permission to do so, but otherwise the right-holder might kill anyone [illegible] [1]

[illegible] [136]

for found hunting on his area, though he would be liable to pay blood-cattle for homicide.

As for trapping, it is said that anybody needs meat from traps because their bellies would swell if a great, size if they ate stolen meat. Public opinion, too, is strongly against such a mean action, and is of itself a powerful deterrent. Nowadays trapping is the chief source of meat, and the common practice is for a man to set three or four traps at a time in different places, and to visit them every two days or so to see if anything has been caught.

Monkeys and birds[1] are killed for their meat and skins; pig provide meat and gut for bow-strings.

2. Agriculture[2]

The Dembo are in process of changing from a hunting to an agricultural existence, from the uncertain hunting economy to the more certain one of agriculture; and the same economic pressure which has forced them to till the soil is now encouraging a desire for cattle, which are being slowly and laboriously acquired. This tends to turn to a more self-supporting state, with less dependence on the Dwarfs for grain crops; and agricultural techniques, both in tillage and seed, are being learnt from the Dwarfs and from Europeans.

Both sexes work in the cultivated plots (ndhoni), and are helped by children, who weed the crops, herd the stock, and milk the cows. The crops grown at present are sorghum (Sorghum vulgare, called amele in Swahili) and maize; millet and wheat are still bought from the Dwarfs, from whom the Dembo also get thatching materials and other necessary. Within the distribution of the forest into hunting areas, people cultivate the ground close to their own houses, and a group

[1] The birds killed are:
[illegible]
[illegible]
[illegible]

[illegible]

[2] Under the term "agriculture" is included for the Dembo under consideration, while in Chapter VIII of this thesis agriculture is shown more important in comparison with stock-raising even if only on a small scale.

the case of the Kikuyu we might include animated spiritual beings as far as [illegible]

3. Land in relation to the spirit world

One aspect of this belief in personal spirits who retain an interest in the welfare of their relatives on earth—and apparently a very human interest at that—is that the occupiers of the land go to reside beneath its surface when they die. It seems that some priority or extra primacy is accorded to this belief in early occupation. The 1929 Commission said,

> "... the [illegible] of ancestral spirits appears to [illegible] in the Suk[illegible] system of Uganda, where it is said that the graves of [illegible] five generations of ancestors are held to constitute a claim to the land."

Hobley, indeed, in The Ba-Ganda, had written,

> "[Such] land to be on the alert to prevent people from burying their dead in good gardens, because the gardens thereby become [illegible] lands."

Mr. L.S. then digress this succession, qualifying it as follows,

> "... the graves of previous occupiers could be pointed out as evidence of the claim, but it is important to note that they were merely evidence, the claim itself resting on the original grant and the fact that successive kings had an interest with it" (5).

5. "Baganda land tenure," Africa, April 1930

[illegible] early occupation was of great importance and apparently connected with some priority accorded to the dead.

We might perhaps find in some such principle a partial explanation of the Kikuyu attitude concerning "exile." Kinanjui wa Wamere, a Kikuyu, giving evidence to the Kikuyu District Commissioner's Appeal Case No. 1 of 1919, affirmed that the land in question had been sold by his grandfather and was Kikuyu land, for that he, and his ex-wife [illegible], were entitled to receive gifts in respect of it. Mr Hamilton admitted that the land was lawfully occupied by Kikuyu, but perhaps intended to intimate that the occupation could not be deemed complete until at least two generations of Kikuyu dead were

underneath the soil. That was not in fact the explanation that he gave but there may have been at the back of his mind some feeling of the sort. For otherwise it is difficult to understand, on any principle of direct purchase, how he could reconcile the statements that the land was Kikuyu land and that his family was entitled to receive goats "in balance the profit." His previous statement that "in the old days there was no outright sale," though it confirms in some degree our contention that the Kikuyu brought their Meratine customs with them, is no sufficient answer because all that could mean is that the land was still Dorobo land. There is, however, another possible explanation which will be noticed later.

However that may be, there was no doubt some consideration of the rights of disembodied early occupiers at the back of the reply an old Kikuyu gave me to the question as to why the Kikuyu immigrants did not drive the Dorobo out but "bought" them out instead. Like all the others questioned on the point he first of all replied that it would never have entered a Kikuyu head to do so dastardly a thing, but when invited to explain he said, "the earliest owners of the land were Gumba. They lived beneath the ground and when they disappeared they vanished into it. Our fathers, when they died, would go there too. And so they could not drive the Dorobo out by force." At first sight there is [illegible] something of a non sequitur in this reply, but examination probably reveals the line of thought. The Dorobo who succeeded them in occupation of the land had presumably already made their peace with living Gumba or with the spirits of the Gumba dead. They were probably blood-brothers of the Gumba or the latter had expressed by ritual their acquiescence in the occupation following theirs. To drive that occupation out would rouse the Gumba in the spirit world and call forth spiritual opposition to the new invaders. In any case the Gumba were still there—beneath the ground—and any rupture of the land, still theirs within the spirit world in partnership perhaps with the Dorobo dead, would certainly offend them and be liable to undermine (the very word) Kikuyu operations in a stretch of land the like of which, for agriculture, they had rarely seen. Not only that, but what a reception would they get as guests when in their turn they ceased to live on top and joined the underworld!

• 423 /300 cont./

The individual person does not have an exclusive right to land or to the use of hunting grounds. Rather, both are common property. Only one half of any game goes down to the size of a medium envelope belongs to the hunter and his companions together, while the other half of a male animal is given to the members of his lineage, those of a female one to the relatives of his wife or wives in both cases insofar as those entitled to receive it live in the immediate vicinity. Of the two tusks (Igarok, Ingwik) of the elephant each receives half. Recently, the large teeth of the hippopotamus have been shared in the same manner, whereas formerly /301/ they were left lying, along with the bones. For the bone (Kadelg, Ivalorak) of the chimpanzee the hunter would go in exchange points or knife points and then distribute these things among the people who previously were to share the meat of the animal. The hides of the dark game belong to the hunter.

All smaller game belongs entirely to the hunter and his companions.

421 Property belongs to the single individual, not to the family
425 community. A lost article is returned to the owner, without the finder's claiming a reward. There is no punishment for the appropriation of found articles.

43 There is no general medium of exchange. Money has not yet been adopted anywhere. Goods are always exchanged for goods. For ivory the cameroon people pay cattle, goats, sheep, iron wire, beads, fabrics. In the individual barter transaction the Wandoffbe never want one kind of goods alone, but always several, and of the inanimate ones as many different kinds as possible. The exchange takes place with immediate delivery and is made valid by spitting on the objects. Only exceptionally is a brief delay granted for a
452 small part of the payment. The creditor seeks to have himself paid
422 by a dilatory debtor through self-help, and only if he has no success with that does he make a complaint. It not infrequently happens
[583] that the creditor takes a small daughter of the debtor as security, and a marriageable one as a wife; in the latter instance, he deducts the
[672] amount of the debt from the bride price. The debtor's heir is liable, and, to be sure, for the entire debt. With the debtor's inability to pay, the warrantor is liable, if -- which is seldom the case -- one is present at all. The help of the warrantor is also liable.

[illegible]

[illegible] G.O. [illegible] [illegible] [illegible] [illegible]

[illegible] G.O. [illegible] had recorded in an [illegible]:

"The Gibbys themselves say they came from the north and northeast, having their land with stock from the Swedes, an honourable order of stewards." (1)

1. In "The Native Law of the northern Gibbys of British East Africa," Journal of the African Society, April 1910.

and again:

"As far as can be ascertained after the lapse of time, all the land in the occupation of the northern Gibbys was purchased with live-stock by their grandparents or great-grandparents, who bought for the Swedes an honourable order occupied and claimed none the land up to within half a century ago." (2)

2. In "Further Notes on the northern Gibbys of British East Africa," Journal of the African Society, April 1911.

[illegible] G.W.G. [illegible] writes of the present [illegible] and [illegible] divisions of the Gibbys district:

"There is another explanation of individual land tenure which arises from the description of the method by which the present 'holdings' were established. The Swedes from whom the Gibbys purchased the right to [illegible] and cultivate, and the right to live at peace had been [illegible] partitioned on the basis [illegible]. No Swede might [illegible] another one without leave, nor could he hang his [illegible] elsewhere than in his own [illegible]. When the Gibbys came, the emigrant [illegible] of the family purchased the aforesaid rights over a portion of [illegible]. The Swedish boundaries were well known and [illegible] of ancient stone [illegible] and [illegible]. These boundaries were adopted by the Gibbys. Naturally as he [illegible] the Swede, the [illegible] were further in, and the [illegible] of trees between the [illegible] and the [illegible] became [illegible] and relatives to the Swede owner and he would be more willing to sell [illegible] and to the [illegible] next on." (3)

3. Quoted by Brock, op. cit.

[illegible] [illegible] [illegible] [illegible]

4

In an [illegible] the Rev. Charles Hawtrey wrote a paper, "The [illegible] and Laws of some Swazi Tribes in East Africa," from which the following is an extract:

"As the Kibeys advanced they encountered the Swazis ... They appear to have found it more politic to purchase the land from them than to conquer it, and therefore the more wealthy Kibeys bought the land ridge by ridge, and the purchases became more numerous, after there upon the whole country in that way possible. In recognition of the service that chiefs have rendered [illegible] in the way. In Swazis District, many of the original purchasers are still alive, and an old Swazi who lives on the Swazis River can there each parcel of land which he sold and also he kept for himself - the several of the Swazis were also enough to create a part of their land, and to prevent [illegible] there have become the recognised landlords."

Hawtrey made a thorough investigation of the mode of acquisition in the Segovia sub-district in 1911. He says:

"My investigations were made in each location separately, and several thousands of witnesses were individually or collectively examined. The result of my inquiries ... was an unanimous agreement that all arable land was originally purchased by the [illegible] Kibeys from the Swazis [illegible] when they found it [illegible] [illegible]." (1)

1. [illegible]

In a footnote he adds:

"I have no evidence as to how the Swazis obtained the land. The origin of these people is still somewhat wrapped in mystery, but it is to be presumed that they followed the custom of previous tribes which they displaced, e.g., the 'wild' of Kisii. Whatever [illegible], the [illegible] claim to have bought the land from 'human kitten' to the Kibeys District" [illegible] i.e. the Segovia sub-district [illegible] the emigration taking in excess, it could naturally be [illegible] that they found there. The payments were originally made [illegible] in a 'piece of ground'. The [illegible] then sold [illegible] from the [illegible] to the white man."

Unfortunately Beech's record was not as thorough as his investigation, the following is a summary of the published results.

Location	Number of Sellers	Number of Holdings	Acreage	Notes
(14)	?	(?)	17,000 acs.	Wives who had purchased by one Kikuyu from one Swahili.
(?)	0	(?)	5,000	Two of the sellers were Scottish,
(?)	?	(?)	5,000	originally owned by one Swahili
(?)	?	(?)	5,000	
(?)	?	(?)	5,000	
(?)	?	?	5,000	Nearly three-quarters owned by one Kikuyu, who bought it from three Swahili.

In the view of the investigators there had already been considerable sub-division of the original holdings as "purchased" from the Swahili. Concerning location (14) Beech remarked that it "was interesting as it consisted of nine forest land to which the Wa-Kikuyu had emigrated not [illegible] more than 10 years ago. Such as are here live side by side with the Swahili with whom they have to a large extent intermarried."

[illegible] [illegible] [illegible] [illegible]

[illegible]

[illegible]

[illegible]

Colonel [illegible], then Chief Native Commissioner, wrote in 1938 a memorandum, "Kikuyu Explanation of the Origin of the Gitutho and the Githathu System," in which he said:

"In the course of time, the Kikuyu got into touch with these people (the Dorobo), and, where possible, made friends with them .... These Dorobo lived on game, roots, and honey, and in order to collect the latter they hung honey barrels over wide areas of the forest. They had no cultivation. The limitation of their occupation was generally influenced by the presence of these honey barrels and by game pits. The Dorobo were few in number and their villages were scattered in the forest. Gradually the Kikuyu encroached for purposes of cultivation, and began to burn and cut down the trees. The Dorobo .... resented the intrusion by the Kikuyu, and demanded compensation for disturbance of their rights. Individual families paid the compensation demanded by the Dorobo accepting such compensation they made blood-brotherhood and afterwards lived side by side, the Dorobo allowing the Kikuyu to cultivate and the Kikuyu recognizing the rights of the Dorobo to carry on his way of living. In the course of time, members of Dorobo settled down as members of the Kikuyu community and took up cultivation.

"Many thousands of goats and cattle were paid by the Kikuyu to the Dorobo not all at once, but from time to time. The Kikuyu correspondingly occupied the forest area bit by bit. The Dorobo, having but little taste, save in the chase, to whom they paid goats and cattle for permission to reside among the trees. They also paid large amounts of ivory to the chief Laibon, [illegible], in payment of his fealty. Often joined the Kikuyu, and became members of the community when they gave up hunting and became cultivators.

"In order to avoid quarrels and fighting among themselves, the Kikuyu agreed that the particular member of the community who parted with his goats or cattle as compensation should be recognized as the person who had acquired the rights of any particular lands, and so, they argue, none can challenge the [illegible] rights are claimed. When Dorobo elected to remain a member

[illegible] of the Kikuyu community they consented to occupation of what land they occupied, and in course of time they bought and sold, amongst each other, gifts or wives. It is claimed that subsequent to this understanding between the Kikuyu and the Dorobo, it happened from time to time that in the case of a Dorobo still holding a large piece of forest a Kikuyu would obtain it from him in exchange for a girl or girls handed over as a wife or wives, but such a transaction did not mean that the Dorobo left the area. It simply meant that he transferred his rights to the Kikuyu concerned, and joined his community.

"The Kikuyu claim that in the foregoing manner they acquired the Dorobo rights ..."

[illegible] witness recorded his own opinion as follows:

"There is no doubt in my mind that whatever goats and cattle were paid to the Dorobo by the Kikuyu, the payment was in respect of abandonment of the hunting rights and the right to collect honey enjoyed by the Dorobo up to the time of the coming of the forest by the Kikuyu."

[illegible] Dorobo in the area [illegible] the Native Council, Mr. [illegible] Hon. Secretary, expressed the opinion that:

"... all that the evidence before the Commission (i) established

[illegible] an opportune Commissioner to investigate the Dorobo system in July 1932.

... the fact that the Kikuyu or Dorobo [illegible] might have had from time to time made payments to [illegible] not in payment for the land from the Dorobo, who [illegible] hunting and honey rights, with an conception of ownership in land or any idea of land as a marketable asset, but as a mere payment in view the dependence and need of the Dorobo and in order that they (the Kikuyu) might remain peaceably in occupation of the land they were then in occupation of ... I should imagine that they certainly never opposed themselves the fact the Dorobo were the owners of the land or could pass any title to it. Though it may be that one day we may be put there to consider themselves the owners by purchase."

[illegible] Section F1.6

The following is an extract from a contemporaneous account, also in [illegible], by [illegible] G.A. Grabham.

"Thats (the Kikuyu) methods of purchase from a people knowing nothing originally of money or lands, are obviously a later interpretation of early transactions, just as the feudal system is often alleged to have been conceived by modern historians."

Evidence taken by the 1932 Committee

The evidence given by the Kikuyu tribe on the issue of acquisition of their land to the 1932 Committee is contained in the following account.

"Question explained. The meaning does not exist in Kikuyu for discussion and is prepared to proceed.

"Question 1. How to which land was acquired.

In the very first place the country where here was occupied by Wandorobo who were hunters. (In this place the meaning cited for adjournment for discussion—adjourned for about 2 hours.) When the Kikuyu first came the hunters objected on the ground that the coming of these for cultivation would spoil their honey supply and drive the game away from the game paths and ways. They said if you want the land you must pay us for it and not otherwise agreed to pay. In the first place each Kikuyu who bought land consequently obtained a Wandorobo as a token of good faith. Then the Wandorobo who had been obliged found the price which might be 30 or 100 sheep. Then there was a ceremony of marking out the boundaries. First the present was paid over and then the Wandorobo (a figurative title and he Kikuyu) was supplied by the purchaser. This was slaughtered and the meat eaten by the ceremony of marking out. Then the Wandorobo and the very principal one his wants as many a holes in the ground which marked by having one of them four of other Wandorobo. Then a Kikuyu elder followed planting titles and also walks along the boundary, accompanied by a Wandorobo always. The Wandorobo did not conveniently and his whole duty. He usually received a goat, which might be sold apparently subsequently. Usually the Kikuyu only bought a goat, and bought more as he could afford it, as the land might be bought by another. If a man wanted to buy a larger area than he could pay for, he could

Each man fought for himself, even though he might have to get his friends to help him with cash as in the case of buying a wife. Occasionally the Akikuyu stayed on and was given a Kikuyu wife. Sometimes he accepted a Kikuyu girl instead of cash in payment in which case he had to stay. It was always an absolute sale and there was no possibility of redemption."

Witness Evidence taken by Land Commission

The African evidence before the Land Commission is very helpful. The witness when claims usually consist of conventional statements according to a set formula—"the tribe", now consisting of so many hundreds of people, many centuries ago bought each and each a piece of land (generally ill-defined) from a Dorobo called Ko-rokho for so many thousands of goats and a girl or son." The Commissioners remark that "They took evidence on several of these claims, which enabled them to understand the nature and issues of such claims generally. The evidence was very voluminous and conflicting and the Commissioners were of opinion that it was of no great assistance to them in arriving at any conclusions on the questions upon which they were called to express an opinion." Most of the oral evidence was an appeal to the emotions or a rigmarole of deceitful subtlety rather than a reasoned argument or straightforward statement of demonstrable fact. Many of the witnesses set out to do their reasoning or claims rather than logical or even reasonably credible. "We took to your country ones bought with the cost of people" asked one, and "Can the King understand that he has taken from us not only our land but our lives?" another. An original explanation of the Dorobo (probably not to be doubted in its principle) was attempted by one witness. "What about the people who came here?" he said, "Did they come because they heard that everybody was going to sell the land? The people called Dorobo at the site who sold the land [illegible] have seen the same people who came from Kikuyu, but they came altogether. But the Dorobo from whom the land here was bought were the people who came down five ahead of the others and had taken up the land and driven out the elephants and buffaloes and other game, clearing them with fires and arrows and digging gardens for the Dorobo, and the reason why they themselves sold the land is the agricultural people who came after and that they should be expected to have sold

and their cousins and for having to cross five and do all the hard work. "The 'Royal Kilkeys Society of Southern Ulaidia of Kilkeys' tried to exploit a similar misrepresentation. "From the beginning we were Seyses and Wilkes," they said, "closest of our kind we brought from Sweden, who were the original owners. The Swedes were a part of the Kilkeys tribe who were dwelling in the Caves, living on the meat and blood of animals, and the other part of the tribe brought it from Rome." Another witness demonstrated his credibility by giving his version of the list of the Kilkeys generations ago, which must have appeared to the Commissioners to be just about as relevant to their subject as a list of the Kings of Israel until the mortal comes to an end with the most emotional appeal — "are you going to reckon all my words so that there will be no more generations? ... My cry to you is for ninety generations, each generation to have two hundred to hand to their succeeding generation, and my cry is also to my generation to leave to the following generation if you do nothing about it." It seems to have escaped the witness that the dispossessed Swedes might have had something equally urgent to say on the subject and that the land by any conceivable or potentially just reckoning was owed as by the native generations on to the two succeeding them.

Canon Lindley's Evidence

Notice must be taken of the evidence given by the Rev. Canon Lindley to the Land Commission. Some years before (in 1858) he had written a letter to the Daily Leader of which two titles from which the following is extracted:

"I am unable to narrate quarrels as I thought that the idea of the Kilkeys having purchased their land for large numbers of cows and sheep is a fabled up affair, an 'fairy tale' ... If such were the case the Kilkeys would be a richer people indeed. So it is impossible to count the old men sitting and giving contradicting evidence with regard to the early history of their land tenure. Why! They actually had to pay the Swedes who may be considered a primitive form of money rent. They were charged, beside a rent, direct or indirect, or in English 'cattle murder rent.' This young man was one part of the tax claimed by the Swedes women for nothing in a law that brought taxes

[illegible]

[illegible] extinguish [illegible] of following paths, as the laws forbid native not exclusively parties to do, and in getting away as to lay by a stolen kind of weighing scale, while he extend the boundary of the land which was about to change ownership. Can anyone be so foolish as to suppose that they made up stories of this kind on purpose to dupe the Europeans and make them believe that they bought land from other natives? I am told by well travelled men that land means to a practically unknown thing among primitive tribes before the advent of the white man. If that is true, and I have no reason to doubt it, then I venture to think that this peculiar characteristic of the tribe discoverable by a study of their folk-lore, should be considered a matter of extreme interest, and not lightly thrown aside because it happens to conflict with preconceived ideas, and to some rules does not fall in with what one wishes to prove in the case."

In a memorandum to the Land Commission Lieut Lindley wrote:

"Coming now to the question as to whether there is any truth in the statements made by the Kikuyu that they purchased their land from the Dorobo I can only say that I was told this many years ago in my visit that as it is really was a fact and I could [illegible] never find anything to make me doubt it. I am absolutely convinced in my own mind that what they say about this is absolutely correct."

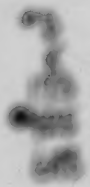
Findings of Land Commission

The Land Commission, like the Lyle Commission, found it difficult to come to any clear and conclusive as to the nature of the payments, if any, made by the Kikuyu to the Dorobo. The Commission had recorded:

"We could not define the exact significance of the claim that they 'bought the Dorobo out'. It is at least certain that payments were made, and the Kikuyu mention are the subsequent concessions to the occupation of area over which Dorobo families were hunted. This, which is all that is apparent in the purpose, is common ground."

The Land Commission expressed its general conclusions as follows:

"The vast majority of claims made to [illegible], tentative of various claims by the Dorobo. There are [illegible] cases in which the claim



[illegible] accompanied by a statement of the payments alleged to have been made. The average payment, according to the claims, [illegible] sheep and goats, 10s each, 1l for cows and goats as sheep, 5l cattle and a number of other things, while the whole total of recorded payments is 11l. 8s. 8d. goats, and the rest in sheep. We regard these figures as tentative and conjectural, whether we look at them from the standpoint of the number of goats that the Kikuyu are known to have possessed, or the grain-producing capacity of the Reserve, or compare them with the payments recorded in twelve Tribunal cases [illegible]. We do not suggest that these claims are deliberately false. There may be some which are true. No doubt there are also cases in which the claimants, being ignorant of the true history of land sales, were led many [illegible] encouraged witnesses by the general spirit of an aggressive claim is very evidently absent [illegible]. We feel that it would be rash for us to accept any detailed opinion on the witnesses' testimony given to the Native Tribunal [illegible]. We have not yet attempted that, in origin, they were payments for land or not. We can only say at this point that we are satisfied that payments of goats were sometimes made by Kikuyu in transactions for the purpose of alliance or peacemaking, that average price in these cases was often considerable and may originally have been the measure of the consideration, and that the use in terms of goats was by no means limited to the Kikuyu have experienced [illegible].

In twelve claims, where titles had been adopted by the Kikuyu witnesses in fact, while it is true that payments were made predominantly in the clearing proceeded and those according to the custom of land disputes, yet there was a proposal was to the land, and, though the payments were almost ever consecutive, or even not necessarily ancient, and the payments are irrecoverable. It seems improbable that the subsequent payments can be regarded as the balance of a stipulated purchase price, because some cases multiple land and the arrangements of that kind. The suggestion that the five payments can be the land and the other seven payments for the clearing is hard to accept, because we cannot conceive that the land would have been worth anything without the right to clear it, for a holding that the original

[illegible]

"Possibly the Gilbert Islanders had land rights in the Ocean Islands and so purchase from the Banabs would not work out very favourably for them, if it were used as the early support of their rights. The Banabs also reasonably contend: a) that the sales, generally speaking, are not proved, and that probably most of the land was not sold; b) that the obligations of protection contained in these Gilbert adoptions was not carried out, and that, in case as the Gilberts had got the land, the Banabs are entitled to be obliged' as the Gilbert Ordinance contained in the 1938 Commission; c) that the alleged 'sales,' when they took place at all, were not final, but only redeemable loans, as the custom of Gilbert Islanders proves, and that the alleged final payments are not generally agreed by the Banabs and did not reach many of them; d) that in many cases they are still partners in the land; and e) that, when and in so far as they still hold, they frequently reserved a place for themselves, as the Gilbert Land Tenure Report admits.

"We don't see why the responsibility of pronouncing on these questions, but we think that, if the Gilberts were fully to realize their implications, they would be too ready to raise that every land question should be decided on historical grounds and would be more willing to concede something to the claims of beneficial occupation.

"In a process which covered, as we have seen, partly of alliance and partnership and partly of adoption and absorption, partly of payment, and largely of force and chicanery, the Gilberts had already succeeded the Banabs when Queen Victoria granted through Gilbert land in 1887 ...."

It is to be remarked, however, that the Land Commission's findings that the process of succession contained "largely of force and chicanery" does not entitle us, however fully we accept that finding, to expect or even the Gilberts claim that the outright purchase of land was possible and in fact practiced. There is no doubt at all that valley land can be, and frequently is, bought outright by one Gilbert from another in the Ocean Islands, but, as every District Officer who has served there knows only too well, to obtain land by chicanery or even force rather than by purchase is an integrative component in modern Gilbert ideas.

adoption ceremony the transaction was placed on a legal basis for both parties and became absolutely binding." (3)

1. In Kilbane unpublished study of the Ibeliono Ndoro.

(i) Meaning of words used

By the European investigators of the Ndoro method of acquiring land three statements we have recorded as that a very general use of words which usually mean to us some form of outright, irrevocable exchange (Boyce: 'purchase'; Routledge: 'paid for the land'; Fuller-Smith: 'sold'; Lovibond: 'bought or borrowed'; McClure: 'rented'; Eyre: 'bought me'; Northcote: 'purchased'; Dobbie: 'bought'; Beech: 'purchased'; Ainsworth: 'paid'; Watkins: 'purchased'; Cases Lindley: 'bought'; 1918 Commission: 'payments'; Land Commission: 'succeeded the Ibedie'; Dr. Lindley: 'bought'). Several of these investigators qualified the expressions they used to us so even such affirmed or suggested that they did not necessarily mean literally an outright irrevocable transfer of land in the European sense (Northcote: 'the right to hill trees and to cultivate and the right to live in peace'; Beech: 'on piece of peace'; Ainsworth: 'in respect of dominance'; Watkins: 'obviously a loan interpretation'; 1918 Commission: 'more explanation are defined'; Land Commission: 'by a process partly of alliance and partnership, and partly of adoption and absorption, partly of payment, and largely of force and discovery'). There is a lack of definition in the recorded statements of Boyce, Routledge, Fuller-Smith and McClure. Lovibond's account appears to imply outright purchase but is not entirely clear on the point. Eyre and Dobbie seem to have understood their informants to refer to outright purchase, and Cases Lindley and Dr. Lindley are both absolutely correct that the payments to the Ibedie involved an irredeemable transfer of land ownership, equivalent to a transfer of the freehold in our own system.

(ii) Diffusion in assessing value of evidence

There were and are obvious difficulties confronting enquirers. It is probable that in the early days the main difficulty was simply one of interpretation. Latterly the chief problem has been a political one—it has become necessary to assess the value of

Northern 70 G-0 (ca. 1935-1950) 1950 FL10 Kikuyu FL10
Dorobo FL6

C

will seek adoption there. The first faint-hearted trickle of Kikuyu from Murungu to the south possibly did this, but when the effective exodus began the Kikuyu could have gained the confidence inspired by numbers. They would start settlements and set about the clearing of the forest without the leave of anyone. Then the Dorobo would appear and enter an objection to this encroachment on their means of livelihood. Quite possibly a few Kikuyu had already died from poisoned arrows loosed at them by unseen hunters who resented the intrusion on their hunting-grounds, and the Kikuyu settlements would have had to mount a constant guard by day and night to try to stop such murders, and would have had to provide armed warrior escorts every time their women went away from the homestead about their household chores. Neither the Kikuyu nor the Dorobo would have liked this state of affairs. The former wanted agricultural land, and peaceful penetration was the safest way to get it; the latter knew quite well a few occasional killings here and there among the interlopers would be of no avail; the encroachment would continue. The obvious answer was adoption, which, at least in theory, would give both peoples something of what they wanted. But the Kikuyu, arrogant by now by reason of their numbers—there was probably no more than one Dorobo family to a ridge—would claim that the adopting should be done by them, they being the only party with the power to guarantee protection to the other. But the rite itself entailed no sale of any kind and no exchange of property. The one exchange was that of vows involving a unity of clan, a community of wealth, the sharing of resources, reciprocal assistance, mutual trust and an unstinting aid by either when the other was in need—in fact the obligations common decency and custom and the law recognized of close relations in the gens.

Acquisition by pledge

The second way was that of pawning cultivation rights in land against the temporary accommodation of loan of goats. This was the so-called redeemable sale of all the other tribes within the Unit, including the Kikuyu to the north. There can be little doubt that when the Kikuyu from Murungu crossed the Chania they brought their

D
K
174
425
426

customs with them, and these did not include an outright sale—transfer in perpetuity—among Kikuyu. This in itself does not at once rule out the possibility of some tradition or of a tribal memory of outright purchase from Dorobo, nor are we justified, because the present outright sale in Kiambu is thought to have its origin in outright purchase from Dorobo, in arguing the other way round and finding that the lack of outright sale among the Kikuyu of Fort Hall means that there never was an outright purchase from Dorobo in that district.

K Implications of adoption

177
425
517

None the less the way in which the Kiambu Kikuyu claim to have got their land—by outright purchase—can only mean they got it by outright purchase from Kikuyu, that is if we accept it as a fact that a pre-condition of such purchase was adoption. If, in such a case, there were outright purchase, then it was in law an outright purchase by a Kikuyu from a fellow-tribesman, and consequently was contrary to the custom the Kamba people brought with them across the Chania. I have been assured by many Kamba men, both young and old (mostly the latter), that the Metume custom was still their law until fairly recent years, and that the change was brought about after the intervention of the British—some say that the Government inaugurated it, others name the Government-appointed Chiefs who, they assert, forced the change on tribesmen none too certain what its implications were, still others link it with the [illegible] change of currency, money instead of goats, but all who hold the view that there was a change in custom on the point relate it directly or indirectly to the general change in outlook attendant on the European advent.

K
425
517

In any case the Kiambu Kikuyu cannot maintain that both these customs, outright purchase and adoption, were observed in one transaction, for the two are incompatible. One cannot make another man a member of one's family, swear to protect his interests and in every way to treat him as one's own full-brother, and then exclude him absolutely from a share in any portion of the family land, at least not honestly. One might invoke a legal fiction hold that the piece of land he "sold" to one became one's share of family land, the piece he failed to "sell" remaining his, but no Metume custom gives a brother any right of absolute and irredeemable disposal of

The oath

It is not suggested that the Kikuyu deliberately set down and ob-
viously damning an adaptation of the rites of aggregation known to three
and hundred tribes with the express intention of discovering a formula
to suit their book, nor is it suggested that an astute Kikuyu brain would
be incapable of inventing some new system which would give them
at one transaction what they wanted. But the Kikuyu had to be
reckoned with, and they were a people certainly no less conservative
than the average tribe; any startling innovation or any pattern of be-
haviour not readily related to established custom would be rejected.
If the Kikuyu had in fact invented some new rite which gave them
absolute and unconditional ownership of land, and if the Dorobo had
in fact accepted it, we should certainly expect the detail of the rite
to make it clear that outright purchase was an essential part of it and
understood by both. But there is nothing in the wording of the oath
the parties swore (as recorded and translated by Dr. Leakey in his
study of the Southern Kikuyu) which clarifies this point. The Kikuyu
party swore as follows. —

"1. As for me, if any man draws blood of this my Mwathi and
kills him, and if I do not cause him pay me a full hundred (pure
and sheep understood) may I break this (1).

1. Presumably a misprint for "may I break
this," i.e. "may I be broken like this."
The K.kuyu is ndirorukie ugwo.

2. As for me, if I should ever call him a Mwathi, or suggest
that he is not a Kikuyu like myself, may I break this.
3. As for me, if I should fail to treat him as the son of my own
mother, may I break this.
4. As for me, if I should ever seek out someone and get them
to kill him in order that I may acquire his land from him without
paying for it to the full, may I break this.
5. As for me, if any other family should try to enter illegally
the land that I am going to buy from this Mwathi who is per-
forming this adoption ceremony with me, and if I fail to sue
him for so doing, may I break this.
6. As for me, if I should fail to give him a present of so many

[illegible]

would confer on right to land except perhaps a meagre one of cultivation only. The marriage of a Dundas to a Kikuyu girl, the 'bride-price' being paid in land, would in theory be impossible because it would mean a double share and that was obviously to both Kikuyu and Dundas custom, though marriage by exchange of girls between two groups is not a common [illegible] quite unknown in primitive society (1), and some of the Fan (sic) tribes say that many

> 1. Cf. Briggs's story, the Fiji tribe in case by one of its members transacted and answered by Dupon Law," 1908. "If the practice of exchange marriage Dr. Van remarks, "It is, of the form, an institution of permanent importance, and lies at the base of the whole present tribal organization." According to the Fiji theory of exchange, daughters bear children to their father's family by giving. Dr. Van says, "The most probable explanation ... is that it represents an unconscious attempt to reconcile the patrilineal and matrilineal principles." Cf. also C. G. Seligman in "Marriage by exchange in Nigeria," Africa, January 1928. "... it may be said generally that one of the main reasons for the abandonment of marriage by exchange is that women now claim the right to marry anyone they please."

years ago, land being plentiful and grass scarce, a girl was rarely handed over as the "purchase-price" of land among Kikuyu, others declare that this could not be done at all. But I doubt if we can rule this method, which would sometimes mean alliance with a family rich in grass, completely out, although it would entail an infringement of the strict Dundas law. We have seen that such a union would become a matrilocal marriage. It would serve to keep the husband close at hand and make him something of a drone, dependent, leading a lazy life and liable to degeneration. As a long-range method of absorption it would be of some effect.

Another method of acquiring land was that of compensation for a homicide—"blood-money." Theoretically the land would be

redeemable to grant to others. One of the elders, however, have at least a vague idea that land or kindred was sometimes always be redeemed, and the two full elders say that in the early days before debt land was fully accepted, when goats were hard to come by, blood money was sometimes paid to land, which land could never be redeemed after the formal handing over.

The only other method we have mentioned is the exchange of land in accordance with the rules governing exchanges of objects within the reciprocity-enabling class. This, in Gwoka law, was to all relevant aspects a similar transaction to the marriage of a girl, which is itself an exchange of objects within that class. This was the only regular and fully recognized method by which a piece of land could be transferred in perpetuity, and it involved conditions precisely similar to those involved in marriage. The medium of exchange was just the same in both, whether another object in the reciprocity-enabling class or a "spiritual currency" put inside that class by reason of its function. In the strict Gwoka law, as I have said, the payment of "bride-price" in land or "land-price" in brides would be impossible but we cannot altogether rule it out since the Gwoka had degenerated fully into pre-Kikuyu.

Incidentally, if we accept the theory that the regular method of land "purchase" from Gwoka by Kikuyu was a transaction in the reciprocity-enabling class analogous to marriage, we shall not be surprised that, in Canon Leakey's words, "it is impossible to catch the old men slipping." If one asks an old Kikuyu, "Did you really buy [your] Gwoka land?" he will answer, quite truthfully, "Yes." —"Was it redeemable, returnable or defined?" "No." —"Once it was bought it was bought for ever?" —"Yes". —"And it was your completely?" "Yes." If, knowing something of the African custom of "bride-price," one asks similar questions about marriage and gets precisely the same answers, one will not feel the least surprise. And if, in discussing land transactions, we always get these very answers [p. 145] and find ourselves surprised, the reason is that we have failed to disabuse our minds of preconceived ideas, we give a totally different meaning to the words the old men use and come to the conclusion that their story (as understood by us) must most surprisingly be true, or that the old Kikuyu are astonishingly adept at co-operative falsehood. Both conclusions, based solely on the conformation,

D
K
425

would be wrong. We have failed to catch the old men tripping, but they unwittingly, have caught us tripping badly.

Functional irredeemability

If we exclude the payment of "blood-money" (and smaller compensations of that nature) none of the methods mentioned transferred perpetual exclusive rights in land except the last—the "marriage" of it. All the rest of them transferred was nothing but a temporary cultivation right or else a share in user of the family land. But possibly there were differences between the theory and the fact of function. Goats to the Dorobo in those early days were food; they were in the consumable, ephemeral class of objects. A Dorobo given goats did not thereby acquire a store of continuity-enabling objects which could be drawn on as required for continuity-enabling; he did not bank the goats as spiritual resources. If he got a Kikuyu relative to herd them for him—herding was to him and his an unattractive occupation not included in their culture—the flock was treated as a larder, not as an investment in eternity. So that when, if ever, the question of redemption of a piece of land arose the Dorobo could not possibly accomplish it except by raising yet a further loan of goats, which meant, in general, handing over still more land, which was the only object the Dorobo had for which the Kikuyu would exchange their goats. So that such a piece of land, although redeemable in theory, was rarely so in fact, and the gap between the two ideas of irredeemability and impossibility of redemption was not so wide as to remain unbridgeable by a native mind conditioned by a change of habit. And land subjected to Kikuyu agriculture was, in Dorobo eyes, scarcely worth redeeming. The factual irreversibility of land transactions was a functional phenomenon and would soon assume a potency in practice exceeding that of any legal sanction no longer functional. This would no doubt operate as a check on the "redeemable sale" of land, which was in any case a new idea to the Dorobo, and one which, if their elders nowadays can be believed, they never had, in fact, accepted.

Effect of cultural differences

As to land acquired by means of new relationships between Kikuyu and Dorobo families such as those of ritual brotherhood and

S:Lambert--127 G-5 (ca. 1935-1950) 1950 FL10 Kikuyu FL10
Dorobo FL6
K
D
425

quasi-marriage, it would not be long before a strain arose between the parties so united. One can imagine how the Kikuyu must have seen their continuity-enabling goats put to a base ephemeral use by their Dorobo relatives with anything but pleasure, how the never-ending need of sacrificial beasts for carnivoracious satisfaction, not for sacrifice, must have seemed to them outrageous. If the Dorobo diet had been much the same as theirs they would not have grumbled —much. Food to Kikuyu meant the products of their fields and gardens, for although a bit of mutton shared on rare occasions with their "gods" or relatives-in-law, and fairly frequently with brother judges of the local bench, was much appreciated, on the whole their diet was a vegetarian one. Once more the fundamental trouble was the clash of cultures—continuity-enabling and nutritional.

In the first relationship (brother-adoption) the Kikuyu elder brother (for the adoption was a unilateral one) would not be slow in pointing out that his Dorobo younger brother had become to all intents and purposes Kikuyu, and that Kikuyu customary law forbade the begging of a goat by one Kikuyu from his brother except for some sufficient [p.150] reasons such as sacrifice or continuity-enabling; when a brother killed a goat the other brother would be asked to help him eat it, but that was rare, not an every other day event such as his adopted brother seemed to think it. After all, no good Kikuyu (albeit an adopted one) would think of goats as food. Food was grain and roots and herbs, not goats.

And in the other (quasi-marriage) the Kikuyu would insist that if the "marriage" of a piece of land was similar in all respects to the marriage of a girl it must be similar in all respects. Payment for a bride did not go on forever—uthoni yes, but payment, no. Occasional gifts of meat, and even goats if the group-in-law required them for some continuity-enabling purpose—that was only right and proper, but constant goats to eat! Ridiculous! So he would make an end of payments, stop the unprofitable flow of goats, and see what happened. Nothing happened; a girl might leave her husband, taking her children with her, to satisfy a disappointed father. But the land could not do that. And as to "bride-price," the hungry carnivore could not return it to his son-in-land (1), for had he not

by a land uthoni. I use "son-in-land," etc., to illustrate the similarity with "son-in-law" etc., but to show at the same time that the relationship is based on land exchanged, not marriage.

consumed it long ago?

That something of this nature really happened is evidenced by the stories of old Kikuyu living near the Chania. Brother-adoption, so they told me, would provide Kikuyu immigrants with a right to cultivate, but the only way to "purchase" land in perpetuity was to "marry" it. This was the general method of acquiring land. A Kikuyu could not "marry" land belonging to a man whose daughter, if he had one, would be within the prohibited degrees of matrimony; so an adopted brother would either have to satisfy himself with the cultivation right and share in ownership he got by brotherhood, or "marry" land elsewhere. The Kikuyu went on handing over goats to their relatives-in-land for a lengthy period of time, but in the end got tired of it, and some of them insisted that a final payment should be made. According to one account this was, near the Chania, in the Maina generation-age (1875 A.D. or thereabouts).

In areas where the "purchases" were on the whole more recent (the south and west of Kiambu) a similar state of affairs was reached a good deal later, and probably brought to a head by Kinyanjui, afterwards Paramount Chief, who, according to the evidence of Senior Chief Koinange in an Appeal Case (quoted by the Land Commission) had "made a brotherhood-adoption ceremony with Waweru" —a Dorobo—"and made him a sort of chief of the Dorobo. Then Waweru told his people that the old sales of land which his people had made to the Kikuyu were not valid, and that there should be a second purchase ... this second purchase was final." It seems likely that Kinyanjui (Mr. Hall's "fidus Achates") (2) had had his ideas of

2. The late Frank Hall, who founded the station now named after him, Fort Hall, at Mbiri in Metume, referred to Kinyanjui thus in correspondence, copies of which are in the Fort Hall District office.

K
425

finality strengthened by observation of the European system and was, somehow or other, in a position to enforce them with the assistance, whether willing or unwilling, of his Dorobo puppet chief, Waweru. The Land Commission comments that the Dorobo could reasonably contend, among other things, "that the alleged 'sales,' when they took place at all, were not final, but only redeemable loans, as the action of Chief Kinyanjui proves, and that the alleged final payment was not generally agreed by the Dorobo and did not reach many of them..." If for "not final, but only redeemable loans" we substitute "not outright, but, in a few cases, only redeemable loans, and, in the rest, [p. 15] uthoni transactions conditioned by the rules of marriage," we shall, I think, have a somewhat truer picture of the facts.

Conclusions regarding acquisition in Kiambu

We are now in a position to formulate conclusions with regard to acquisition in Karura. Our conclusions are:—

1) that the common method of acquiring land was by exchange within the continuity-enabling class, which exchange created a condition of uthoni so similar in effect to that created by marriage that, having full regard to the native understanding of the functional relationship set up, we shall not be using a misleading term if for convenience and the want of a better word in English we call it "marriage of the land";

2) that a share in ownership, as contemplated in the native law, was acquired in certain cases by a brotherhood-adoption;

3) that various other methods of acquiring land were rarely practiced and consisted theoretically in temporary transactions reversible at will, although in point of fact such rare transactions operated functionally as irreversible; and

4) the Kikuyu statement that an outright irreversible exclusive purchase was effected by a brotherhood-adoption and the payment of a stipulated price in goats or girls is not to be believed.

My answer to the question as to whether Kikuyu immigrants bought or could buy land in the Kiambu District from Dorobo in any sense approaching the transfer of a freehold as understood in English law is definitely "no."

561 /244 cont./
191 elephants, buffalo, and lions, has distinguished himself through

411 For the dobonog of the Wandorobo hunting is what war is for the
[561] El móran of the Masai. Their principal weapons are bow and arrow.
[224] The two-sided bow ([Fig. 83] gari, geleweg) has the shape of a flattened segment of a circle. It is as a rule 1.50 meters long and very sharply flexible. With it belongs a leather quiver ([Fig. 85] madiet, madimoig) with arrows ([Fig. 84] mat, mara). The wooden arrow-shaft bears a small notch on its rear end for setting it on the bow string, and directly in front of it the three-part feathering (haiya).
[439] The iron point, which the Wandorobo usually buy from Wakuafi and Masai blacksmiths, but also from sedentary Negroes, and more

423 /260 cont./

The individual person does not have an exclusive right to land or to the use of hunting grounds. Rather, both are common property.
224 421 Only one half of any slain game down to the size of a medium antelope belongs to the hunter and his campmates together, while the other half of a male animal is given to the members of his lineage, those of a female one to the relatives of his wife or wives: in both cases: insofar as those entitled to receive it live in the immediate vicinity. Of the two tusks (ligatok, ligasch) of the elephant each
[178] receives half. Recently, the large teeth of the hippopotamus have been shared in the same manner, whereas formerly /261/ they were left lying, along with the bones. For the horns (hadong, hadama) of the rhinoceros the hunter receives in exchange poison or arrow points and then distributes these things among the people who previously were to share the meat of the animal. The hides of the slain game belong to the hunter.

All smaller game belongs entirely to the hunter and his campmates.

421 Property belongs to the single individual, not to the family
• 425 community. A lost article is returned to the owner, without the finder's claiming a reward. There is no punishment for the appropriation of found articles.

43 There is no general medium of exchange. Money has not yet been adopted anywhere. Goods are always exchanged for goods. For ivory the caravan people pay cattle, goats, sheep, iron wire, beads, fabrics. In the individual barter transaction the Wandorobo never want one kind of goods above, but always several, and of the inanimate ones as many different kinds as possible. The exchange takes place with immediate delivery and is made valid by spitting on the objects. Only exceptionally is a brief delay granted for a
452 426 small part of the payment. The creditor seeks to have himself paid by a dilatory debtor through self-help, and only if he has no success with that does he make a complaint. It not infrequently happens
[583] that the creditor takes a small daughter of the debtor as security, and a marriageable one as a wife; in the latter instance, he deducts the amount of the debt from the bride price. The debtor's heir is liable,
[672] and, to be sure, for the entire debt. With the debtor's inability to pay, the warrantor is liable, if -- which is seldom the case -- one is present at all. The heir of the warrantor is also liable.

DK 174

will seek adoption there. The first faint-hearted trickle of Kikuyu from Metume to the south possibly did this, but when the effective exodus began the Kikuyu would have gained the confidence inspired by numbers. They would start settlements and set about the clearing of the forest without the leave of anyone. Then the Dorobo would appear and enter an objection to this encroachment on their means of livelihood. Quite possibly a few Kikuyu had already died from poisoned arrows loosed at them by unseen hunters who resented the intrusion on their hunting-grounds, and the Kikuyu settlements would have had to mount a constant guard by day and night to try to stop such murders, and would have had to provide armed warrior escorts every time their women went away from the homestead about their household chores. Neither the Kikuyu nor the Dorobo would have liked this state of affairs. The former wanted agricultural land, and peaceful penetration was the safest way to get it; the latter knew quite well a few occasional killings here and there among the interlopers would be of no avail; the encroachment would continue. The obvious answer was adoption, which, at least in theory, would give both peoples something of what they wanted. But the Kikuyu, arrogant by now by reason of their numbers—there was probably no more than one Dorobo family to a ridge—would claim that the adopting should be done by them, they being the only party with the power to guarantee protection to the other. But the rite itself entailed no sale of any kind and no exchange of property. The one exchange was that of vows involving a unity of clan, a community of wealth, the sharing of resources, reciprocal assistance, mutual trust and an unstinting aid by either when the other was in need—in fact the obligations common decency and custom and the law required of close relations in the gens.

DK 174 425 426

Acquisition by pledge

The second way was that of pawning cultivation rights in land against the temporary accommodation of loan of goats. This was the so-called redeemable sale of all the other tribes within the Unit, including the Kikuyu to the north. There can be little doubt that when the Kikuyu from Metume crossed the Chania they brought their

D
K
174
425
426

customs with them, and these did not include an outright sale—transfer in perpetuity—among Kikuyu. This in itself does not at once rule out the possibility of some tradition or of a tribal memory of outright purchase from Dorobo, nor are we justified, because the present outright sale in Kiambu is thought to have its raison d'être in outright purchase from Dorobo, in arguing the other way round and finding that the lack of outright sale among the Kikuyu of Fort Hall means that there never was an outright purchase from Dorobo in that district.

K Implications of adoption

177
425
547

None the less the way in which the Kiambu Kikuyu claim to have got their land—by outright purchase—can only mean they got it by outright purchase from Kikuyu, that is if we accept it as a fact that a pre-condition of such purchase was adoption. If, in such a case, there were outright purchase, then it was in law an outright purchase by a Kikuyu from a fellow-tribesman, and consequently was contrary to the custom the Karura people brought with them across the Chania. I have been assured by many Karura men, both young and old (mostly the latter), that the Metume custom was still their law until fairly recent years, and that the change was brought about after the intervention of the British—some say that the Government inaugurated it, others name the Government-appointed Chiefs who, they assert, forced the change on tribesmen none too certain what its implications were, still others link it with the [p. 104] change of currency, money instead of goats, but all who hold the view that there was a change in custom on the point relate it directly or indirectly to the general change in outlook attendant on the European advent.

K
425
547

In any case the Kiambu Kikuyu cannot maintain that both these customs, outright purchase and adoption, were observed in one transaction, for the two are incompatible. One cannot make another man a member of one's family, swear to protect his interests and in every way to treat him as one's own full-brother, and then exclude him absolutely from a share in any portion of the family land; at least not honestly. One might invoke a legal fiction hold that the piece of land he "sold" to one became one's share of family land, the piece he failed to "sell" remaining his, but no Metume custom gives a brother any right of absolute and irredeemable disposal of

423 /260 cont./

The individual person does not have an exclusive right to land or to the use of hunting grounds. Rather, both are common property. 224 Only one half of any slain game down to the size of a medium ante- 421 lope belongs to the hunter and his campmates together, while the other half of a male animal is given to the members of his lineage, those of a female one to the relatives of his wife or wives: in both cases: insofar as those entitled to receive it live in the immediate vicinity. Of the two tusks (ligatok, ligasch) of the elephant each [178] receives half. Recently, the large teeth of the hippopotamus have been shared in the same manner, whereas formerly /261/ they were left lying, along with the bones. For the horns (hadong, hadama) of the rhinoceros the hunter receives in exchange poison or arrow points and then distributes these things among the people who previously were to share the meat of the animal. The hides of the slain game belong to the hunter.

All smaller game belongs entirely to the hunter and his campmates.

421 Property belongs to the single individual, not to the family community. A lost article is returned to the owner, without the finder's 425 claiming a reward. There is no punishment for the appropriation of found articles.

43 There is no general medium of exchange. Money has not yet been adopted anywhere. Goods are always exchanged for goods. For ivory the caravan people pay cattle, goats, sheep, iron wire, beads, fabrics. In the individual barter transaction the Wandorobo never want one kind of goods above, but always several, and of the inanimate ones as many different kinds as possible. The exchange takes place with immediate delivery and is made valid by spitting on the objects. Only exceptionally is a brief delay granted for a 452 small part of the payment. The creditor seeks to have himself paid 426 by a dilatory debtor through self-help, and only if he has no success with that does he make a complaint. It not infrequently happens [583] that the creditor takes a small daughter of the debtor as security, and a marriageable one as a wife; in the latter instance, he deducts the amount of the debt from the bride price. The debtor's heir is liable, [672] and, to be sure, for the entire debt. With the debtor's inability to pay, the warranter is liable, if -- which is seldom the case -- one is present at all. The heir of the warrantor is also liable.

/261 cont./

000 D 431 D 572 is present at all. The heir of the warrantor is also liable. The giver is offended by a refusal to accept a gift. A counter-gift of approximately the same value follows gift-giving. The giver spits upon the gift when he hands it over. The Wandorobo never conclude into blood friendships among themselves, but only -- and, to be sure, very rarely -- with members of other tribes. The ceremony observed for this resembles the one described above among the Masai. If a stranger has bought ivory from him and paid only part of the price, D [197] [426] the ol doroboni often likes to conclude blood friendship with him because he thinks that then the debtor must die if he does not repay the debt as quickly as possible (1).

D [197]

1. This view is in general rare; it was not originally peculiar to the Asá, but adopted.

D 682 628 [171] [672] As among the Masai, the legal view makes no distinction between murder and manslaughter, but indeed between the latter and negligent homicide. A murderer caught in the very act is subject to blood revenge, for the execution of which every man belonging to the family of the one murdered and in some districts also any of his friends and campmates are justified. If the avengers do not succeed in capturing the murderer on the day of the murder, /262/ the latter is safe from blood revenge, for people see in the unsuccessful search for him a command of God to let him live. To atone for his deed, however, he must pay the principal heir of the deceased one large and two small ivory tusks. Negligent homicide is punished by the payment of a medium-sized ivory tusk. If the perpetrator and the one who was killed belong to the same lineage, the punishment is considerably D [648] less than if they are from different lineages of the same tribe. On the other hand, if the two belong to different tribes, the ones entitled to blood revenge often hand over the execution of it to the Masai, who kill the perpetrator, even if they do not capture him until after several months. Up to the completed payment the perpetrator is D M 682 648 M [564] [326] regarded as puni-andgt, corresponding to the ol oikobani of the Masai. If an Asá kills a Masai blacksmith, the deed remains unpunished because the blacksmiths are too weak for revenge and the Masai would

1: Huntingford E-4, 5 (1938-1939) 1953 FL6 Dorobo FL6

Means by which the Dorobo can acquire stock are: (1) By bridewealth: when a Nandi marries a Dorobo girl, her father gets the normal Nandi payment of one cow, one ox, and a varying number of goats. (When a Dorobo man marries a Nandi girl he has to find somehow the same amount of cattle.) (2) By gift exchange: a Nandi makes friends with a Dorobo, mainly to get honey, and after the first step towards friendship has been taken, the Dorobo gives him some. Later the Nandi gives a goat, and the way is thus paved for the exchange of cattle. This exchange is independent of the honey, which is given by the Dorobo from time to time. This process of acquiring cattle is of course a form of payment, but it is purchase under the peculiar conditions of forming a friendship by a previous exchange of gifts, for the Nandi do not readily part with their cattle, and it is necessary to lead up to the final stage by a preparatory exchange of other things. So far the Nandi have been willing to exchange male stock only in this way; to get cows the Dorobo have had to rely on bridewealth. (3) The Nandi will sell goats for cash, but not (at least up to 1939) cattle. The Dorobo do not seem to want sheep; they had none in 1939, nor when I first knew them in 1927.

Inheritance

The general rule is that when a man dies, his goods are kept by his wife for handing over to his children if they are small, or they pass straight to them if grown up. When a man has neither wife nor children, his heirs are his brothers, his father's brothers' sons, or his mother's brothers' sons. Women do not inherit stock. Land rights in the forest pass to the eldest son, or to a brother, or to one of the relatives termed *macokor* (see below, p. 62). Weapons are left to a brother, to a *macokor*, or to a clansman. Dogs are left to sons, or else to a brother or *macokor*. Goats are divided proportionately between sons, or pass to a brother or *macokor*. The proportion is roughly as follows, assuming that a man left seven goats and three sons: to eldest son, three; to second son, two; to youngest son, one; to his wife, one, this and its offspring going eventually to the youngest son. The theoretical division of cattle is approximately thus: to eldest son, two; to other sons, one each; to wife, one, which reverts to the youngest son.

Division of Labour

Everything connected with hunting, bees, and weapons is done by men; domestic work by women. The main occupations are divided thus:

Men:	Women:
Making fire.	Building houses.
Hunting.	Collecting vegetable food.
Trapping.	Getting water and firewood.
Putting meat on to cook.	Looking after meat cooking.
Making honey-barrels.	Cooking other food.
Collecting honey.	Milking when there are cows.
Making weapons.	Making baskets.
Trading with the Nandi.	Preparing skins.
Getting coloured earth.	Making clothes, etc.
Cutting wood.	Care of the children.
Making fences.	Sweeping huts.
Preliminary heavy work in the *mbaret*.	Cultivation, all stages.

Children of both sexes help in weeding and herding stock; girls help with the housework and milking, though boys are allowed to milk till they are circumcised. This division is followed strictly with regard to the first nine male activities; but with the last three there is some overlapping; and the essential domestic work and cultivation are often done by men, especially when they are unmarried or live quite alone.

6:Huntingford E-5 (1938-1939) 1953 FL6 Dorobo FL6

described as *cemeneneuwet*, i. e. narrow-waisted; she is bigger than the others, with a large head and body and no sting. The workers, called simply *sekemik*, "bees", are considered to be males [8], and the Dorobo say that all the male bees in a swarm fertilise the queen. The queen lives inside the swarm surrounded by the bees, and never goes outside it, being fed by the workers with the honey they make, and she lays her eggs in the fresh combs before any honey has been deposited in them. The workers make honey, according to the Dorobo, by eating the 'water' (*bek*) of the flowers, which they vomit into the empty combs when they return to the swarm [9]. A comb is made (or built, *tec mpokiet* = build the comb) by the mouths of the bees with the help of another substance which they get also from flowers; and from the same source they get wax (*temeniat*) which they bring in on their feet, and use to close up openings in the hive [10]. This is what the Dorobo say. The drone, on the other hand is considered to be a female which does no work and has no sting. The drones just fly about "playing", and as far as the Dorobo can see perform no useful work. They just eat up the honey and after a time the workers kill them, *kutil kütit*, "they cut their necks", so that they shall not eat the whole supply of honey [11]. Terms used to describe bees are:

Kamet = queen (lit. mother).
Sekemik = workers (sing. *sekemiat*).
Kapurenik = drones (sing. *kapuriot*).
Uarek = young bees, grubs (sing. *uaruwet*).
Oldoiyet = swarm.
Mpokiet, *Wanasiet* = Empty comb, either new and unused, or old.
Kipiriritiet = comb full of honey.

The Dorobo seem to have no idea of the length of a bee's life, which in Europe may amount to some seven months in the case of bees born in the autumn.

231 [422] [428] Honey-barrels or hives, *pasanet*, are made of slats or of hollowed-out logs and placed in trees for the bees to swarm in. Once a swarm has entered it is considered to belong to the owner to the barrel. If it stays for a long time (the Dorobo say) it may be inherited by the owner's son; but if it should go from one man's barrel into another's, nothing is done, for though the Dorobo say that their bees get to know them, they do not claim to be able to control their movements. And if a swarm deserts a barrel, the owner just [322] waits till another swarm comes to it. The commoner type of honey-barrel is

[8] The workers are really females whose ovaries have become modified so that they do not normally produce eggs.

[9] This is not very far short of the truth, for bees take into their crops a substance called nectar from the flowers and deposit it in the comb. By the action of their saliva, which produces a chemical change, the nectar becomes honey, and is regurgitated into the cells for storage or for feeding the grubs. (Cf. article Bee in the Encyclopaedia Britannica, ed. 11, by Prof. G. H. CARPENTER.)

[10] Wax is really secreted by special cells in the abdomen of the worker bees.

[11] Drones are in reality the males which mate with the queen. When the mating season is over and food is getting scarce, they are killed and thrown out by the workers.

6:Huntingford E-5 (1938-1939) 1953 FL6 Dorobo FL6

281 missed in the count, but they are used even to-day so much for medical and magico-religious purposes that there is a constant drain on them.

The numbers that I actually counted in the three *korossuk* of Kipkorom, Kelpui, and Sonoiyo were:

		Cattle:	Goats:	Dogs:
Kipkorom:	Arap Keter (Ceserdil)	10	—	—
	Arap Menati	—	10	2
	Arap Korucu	5	—	—
	Arap Minio	—	5	2
	Arap Keter (Kipsan)	5	—	—
Sonoiyo:	Arap Silimbo	20	—	—
	Arap Eusi	3	—	—
	Arap Singira	—	—	3
	Arap Ceruiyo	1	—	—
	Kikon arap Silena	15	—	—
	Koriomoi arap Munyenua	15	—	—
	Kiptoo arap Ngamaam	—	5	—

3. The Economic Division of the S. W. Corner of the Forest

423 The forest is regarded by the Dorobo as their special territory. Not only is it divided between the *korossuk*, but families have rights over parts of it, and these rights pass from father to son. The place where the trees come to an end forms a natural boundary and within that boundary was Dorobo ground where few strangers, except the occasional outlaw or fugitive, cared to penetrate. A man's forest rights included hunting, trapping, setting honey-barrels, and food-gathering. If anyone wished to do something on another man's ground, he might do so with the occupier's permission. A section of forest was not the absolute property of an individual and ratified by a pronouncement of the *koret* council, but was held on a tenure based on the fact of hereditary occupation sanctioned by public opinion: a man's section was automatically taken over by his son and this succession was recognized by the people.

[428]

The forest appeals to the Dorobo in four ways: (1) In the trees they had their homes, and they knew no manner of living in which there were no trees; trees therefore go with the land, which in fact does not count as land, but as something which bears trees. The cutting down of one or two trees on a man's section is his own affair, but if people should begin to cut down many trees, public opinion would be against them: *ngut komac Okiot si kotil ketik ce caw, mecome Okied alak*, "if a Dorobo wanted to cut down many trees, the

hunted by concerted action, and still are, to a limited extent, by individuals, as well as several species of monkey.[1] There seems to have been no very strict close season, as pig were occasionally hunted in the wet weather, though not often, since the forest is difficult to traverse when wet. There are now no lion or elephant, but they are said to have existed when the Sawe and Kipkoiimet ages were young men, i.e. about 1860. Leopards are still common, and are still shot if one runs up a tree after being put up by dogs; they are sometimes caught in traps made of wire, which is not bought, but searched for or stolen from farms. However, a trap made by one Arap Mengati which caught a leopard during one of my visits was said to be exceptional. Buffalo no longer exist in the western end of the forest where the Kapchepkend[2] live, but they occur near Londiani, a few miles to the east.

Hunting parties varied from two to eight men. If, say, eight went out, half would go along one bank of a stream, and half along the other bank, so that one or other party would be sure to get something. They met after the kill, and cooked the meat and ate some of it on the spot. The rest was divided among the hunters and taken home for their families, the unsuccessful members of the hunt receiving a share from those who made the kill. The hunter has to provide, not only his own (elementary) family, but also his father, mother, and wife's father with meat, and the distribution of meat in order of priority, is:—

Hunter: *Meat to*

1. Wife and children.
2. Father and mother.
3. Wife's father.
4. Neighbours (clansmen).

A man has (or had till they were evicted by the government) an hereditary right over a piece of forest, which included hunting, trapping, bee-keeping, and food-gathering. Other people who wanted to hunt there asked permission to do so, for otherwise the right-holder might kill anyone

XI.

Interment of the corpse. -- Hereditary succession.

764 [171] [511] [556] The interment of the corpse differs from the practice customary among the Masai only insofar as the poverty of the Asá affects it. They neither hold a funeral feast nor do they anoint the corpse with fat. Wealthy people, i.e., here such with numerous progeny, are here buried by some, and, to be sure, in the kraal near the hut, so that after death they may hear the conversations of their children and enjoy the fragrance of their meals. All other corpses are simply dragged out of the kraal and put down approximately 100 paces from it. If the corpse has not already been devoured by hyenas the first night, which, moreover, is said not to happen only rarely, since in reality these carrion-eaters roam about the usually foul-smelling camps every night, /255/ then one burns as an offering the residue of the honey beer, consisting of wax particles, beside the corpse. A burial of corpses outside the camp is not customary anywhere. [782] The prayer beside the corpse of a family father runs here: Ûût, nge gurgurta, nge haga = God, father, give advice, give meat. What 765 171 was said above about the Masai holds for the mourning.[1]

• 428 [171] In the right of succession the same principles hold as among the Masai. The insignificance of the goods left behind, however, often makes a division among those qualified to inherit impossible, and one can therefore very often observe in practice that the eldest son (of the principal wife) receives the entire inheritance consisting of bows, arrows, and beehives. The latter form the principal part of [171] the estate and, after the death of a man, are distributed among the sons in the same way as the cattle among the Masai. Just as the latter gives each of his wives a number of cattle to care for and enjoy the use of, the ol doroboni leaves each of his wives a part of his beehives, which the sons of the wife in question then inherit. Widows 768 as a rule join a man of their age class and live with him. Surviving [583] daughters pass into the possession of the eldest son insofar as the bride price is to be paid to him upon their marriage.

1. [See Masai FL12, 18:Merker, category 765--Analyst]

423 /260 cont./

The individual person does not have an exclusive right to land or to the use of hunting grounds. Rather, both are common property.

224 421 Only one half of any slain game down to the size of a medium antelope belongs to the hunter and his campmates together, while the other half of a male animal is given to the members of his lineage, those of a female one to the relatives of his wife or wives: in both cases insofar as those entitled to receive it live in the immediate vicinity. Of the two tusks (ligitok, ligach) of the elephant each

[178] receives half. Recently, the large teeth of the hippopotamus have been shared in the same manner, whereas formerly /261/ they were left lying, along with the bones. For the horns (hadolg, hadama) of the rhinoceros the hunter receives in exchange poison or arrow points and then distributes these things among the people who previously were to share the meat of the animal. The hides of the slain game belong to the hunter.

All smaller game belongs entirely to the hunter and his campmates.

421 Property belongs to the single individual, not to the family

425 community. A lost article is returned to the owner, without the finder's claiming a reward. There is no punishment for the appropriation of found articles.

•43 There is no general medium of exchange. Money has not yet been adopted anywhere. Goods are always exchanged for goods. For ivory the caravan people pay cattle, goats, sheep, iron wire, beads, fabrics. In the individual barter transaction the Wandorobo never want one kind of goods above, but always several, and of the inanimate ones as many different kinds as possible. The exchange takes place with immediate delivery and is made valid by spitting on the objects. Only exceptionally is a brief delay granted for a

452 small part of the payment. The creditor seeks to have himself paid

422 by a dilatory debtor through self-help, and only if he has no success with that does he make a complaint. It not infrequently happens

[583] that the creditor takes a small daughter of the debtor as security, and a marriageable one as a wife: in the latter instance, he deducts the amount of the debt from the bride price. The debtor's heir is liable,

[572] and, to be sure, for the entire debt. With the debtor's inability to pay, the warrantor is liable, if -- which is seldom the case -- one is present at all. The heir of the warrantor is also liable.

Means by which the Dorobo can acquire stock are: (1) By bridewealth: when a Nandi marries a Dorobo girl, her father gets the normal Nandi payment of one cow, one ox, and a varying number of goats. (When a Dorobo man marries a Nandi girl he has to find somehow the same amount of cattle.) (2) By gift exchange: a Nandi makes friends with a Dorobo, mainly to get honey, and after the first steps towards friendship has been taken, the Dorobo gives him some. Later the Nandi gives a goat, and the way is thus paved for the exchange of cattle. This exchange is independent of the honey, which is given by the Dorobo from time to time. This process of acquiring cattle is of course a form of payment, but it is purchase under the peculiar conditions of forming a friendship by a previous exchange of gifts, for the Nandi do not readily part with their cattle, and it is necessary to lead up to the final stage by a preparatory exchange of other things. So far the Nandi have been willing to exchange male stock only in this way; to get cows the Dorobo have had to rely on bridewealth. (3) The Nandi will sell goats for cash, but not (at least up to 1939) cattle. The Dorobo do not seem to want sheep; they had none in 1938, nor when I first knew them in 1927.

Inheritance

The general rule is that when a man dies, his goods are kept by his wife for handing over to his children if they are small, or they pass straight to them if grown up. When a man has neither wife nor children, his heirs are his brothers, his father's brothers' sons, or his mother's brothers' sons. Women do not inherit stock. Land rights in the forest pass to the eldest son, or to a brother, or to one of the relatives termed *macokor* (see below, p. 62). Weapons are left to a brother, to a *macokor*, or to a clansman. Dogs are left to sons, or else to a brother or *macokor*. Goats are divided proportionately between sons, or pass to a brother or *macokor*. The proportion is roughly as follows, assuming that a man left seven goats and three sons: to eldest son, three; to second son, two; to youngest son, one; to his wife, one, this and its offspring going eventually to the youngest son. The theoretical division of cattle is approximately thus: to eldest son, two; to other sons, one each; to wife, one, which reverts to the youngest son.

Division of Labour

Everything connected with hunting, bees, and weapons is done by men; domestic work by women. The main occupations are divided thus:

Men:	Women:
Making fire.	Building houses.
Hunting.	Collecting vegetable food.
Trapping.	Getting water and firewood.
Putting meat on to cook.	Looking after meat cooking.
Making honey-barrels.	Cooking other food.
Collecting honey.	Milking when there are cows.
Making weapons.	Making baskets.
Trading with the Nandi.	Preparing skins.
Getting coloured earth.	Making clothes, etc.
Cutting wood.	Care of the children.
Making fences.	Sweeping huts.
Preliminary heavy work in the cultivation.	Cultivation, all stages.

Children of both sexes help in weeding and herding stock; girls help with the housework and milking, though boys are allowed to milk till they are circumcised. This division is followed strictly with regard to the first nine male activities; but with the last three there is some overlapping; and the essential domestic work and cultivation are often done by men, especially when they are unmarried or live quite alone.

6:Huntingford E-S (1938-1939) 1953 FLA Dorobo FLA

they have been stock-owners for too short a time, and on too small a scale to have formulated *or developed any* cattle *customs* of their own; they do not think (like the Nandi) in terms of cattle; and their main efforts are at present concentrated on trying to acquire cattle. For the last, three ways are open to them, all slow and laborious: bride-payment, gift exchange, and purchase.

Bride-payment. A Dorobo whose daughter is married to a Nandi receives for her the number of stock that a Nandi would give for a girl of his own tribe, i.e. 1 cow and 1 ox or bull, together with a variable number of goats; and when a Dorobo marries a Nandi woman he has to pay at the same rate. Arap Keter acquired his cattle from the marriages of his three sisters: the eldest, Kapotikuany, was married while his father was still alive, and on the old man's death he inherited the cattle paid for her; the other two, Ceuum and Taprandic were married after their father's death, and the cattle for them (amounting in the case of Taprandic to 1 bull, 1 cow, and 5 goats) was paid to Arap Keter.

Gift exchange. Nandi from time to time make friends with Dorobo, *chiefly* for the purpose of getting honey. The first move after two men have come to regard each other as friends, *cowat*, is for the Dorobo to give the Nandi some honey, without expectation of any immediate return. After a time, the Nandi gives the Dorobo a goat, and thus the way is prepared for the handing over of cattle. Arap Minio became the friend of a Nandi at Ofleau called Kapkile, and eventually got from him an ox in exchange for a fur cloak; and on another occasion he got an ox in exchange for seven goats which he bought with his wages for working on a farm. Arap Koruen in his youth hunted at Kapiyet in Nandi, and shot *thirty* monkeys, from which he made fur cloaks which he exchanged for cattle. To-day he has *five* head of cattle which are herded for him by a Nandi named Kipkoeir arap Serem on Farm 1679: the Nandi looks after them in return for the use of their milk, Arap Koruen being given a small amount of it. This process of acquiring cattle is, of course, a form of purchase, but it is purchase under the peculiar conditions of forming a friendship by exchange of gifts first. The Nandi do not readily part with their cattle, and it is therefore necessary to lead up to the final stage, as the Dorobo regard it, by the preparatory exchange of other things. And as a method of acquiring cattle it is limited by the fact that the Nandi seem willing to exchange only male stock in this way, so that for female stock the Dorobo have to rely on bride-payment.

Purchase. The Nandi do not sell cattle to the Dorobo except as just described, that is, in the form of bride-payment or by exchange. But they will sell goats for cash. The Dorobo do not seem to care about sheep, for in 1939 none possessed any.

At the time of their move in 1937 the Dorobo were credited officially with a large number of cattle, some 2000 head in fact. But in 1939 the actual numbers that I saw and counted (and I have reason to believe that these were practically all they had) were very much smaller. The following list, while it may not be perhaps completely accurate, gives a truer idea of the real numbers. It will be noticed that there were few goats; some were undoubtedly

14 Huntingford E-A (1930-1939) 193
[P 191, A]
FLS Dunsbo FLS

Apart from the rule of exogamy, there are certain other marriage regulations:

1. A person may not marry anyone who comes into the *tiliet* or relationship (except F. Sis. D. D.), that is, anyone addressed by a relationship term, or as *oreyon*.
2. A man may not marry his wife's sister because such unions are thought to be sterile.
3. A person may marry into the clan of his or her M., M.M., Br.W., or Sis.H.

Pre-marital intercourse with anyone in the *tiliet* is forbidden; but with a clansfellow condoned, though not approved of.

The shortage of women and the lack of wealth have resulted in the Dorobo being largely monogamous, though if a man has the wealth, he may have more than one wife. The *hedua* (bride-price)[1] is said to have been formerly 4 oxen for slaughtering; today it is 1 cow, 1 ox and 4 goats, which go to the bride's father and become his personal property. This *hedua* is high for a people who own little or no stock; but by means of gift exchange cattle can be obtained from the Nandi (See below, p. 192.) Rarity of divorce is another result of this shortage, and since a wife is something comparatively hard to come by, she is more cherished than is usual among other peoples where women are plentiful. The inability to get wives has produced a tendency to what may be called *mondeit*, that is, unmarried men (some of whom never marry) live entirely alone, and do all their domestic work, as well as hunting and cultivation, without assistance.

III

ECONOMIC LIFE.

A. Environment.

The home of the Kapchepkendi Dorobo is the western end of the high ground which occupies the country between Eldama Ravine and the Nandi escarpment. The greater part of it is covered with dense forest, and is crossed on the S. W. corner by two parallel paths from Kipkorom in the north to Ndoroton in the south. The forest begins about the 8,000 ft. contour, and to reach it from any side entails a steep climb of

[1] On this term, see "Bride-price in antiquity," *MAN*, 1931, 187.

14.Huntingford E-S (1930-1939)1942
FLS Dorobo FLS

[P. 196, A]

Economic life to-day is centred more and more on the *shamba* than on hunting. 241 423

The family group is interdependent: the men trap, make tools, protect the family; the women look after house and children, and prepare food; the children, while dependent on their parents for existence, help them with the *imbaret* and live-stock, and in various other small ways. 592

There is little specialization, since all men can make traps and honey-barrels, and all women can make baskets. Joint-production occurs in (1) house-building, when the whole family takes part; (2) cultivation; (3) in hunting and in digging coloured earth. Food produced by the family is shared by husband, wife, and children, and also by the husband's and the wife's parents. Meat caught by trapping is divided between the trapper's family and the other people living in the settlement. Vegetable foods are not shared thus, since they can be got by all. Hospitality is given to visiting relatives, clansmen, age-mates (though they do not sleep with their host's wife), and even to stray travellers, once their good faith is established. Beer is drunk at social gatherings of men or women, at clan councils, and on ceremonial occasions. And just as meat is distributed in a particular way (p. 193), so with tobacco: a man who acquires some gives it first to his father, then to his wife's father, and lastly to his brothers and clansmen, if it will go as far. [462] [342] [241] [224] 592 421 [224] [244] 574 273 276 [431]

The typical Dorobo hut, *kochonget*, is extremely simple, being no more than a framework of sticks covered with leaves, and a hide on top. They are now building larger and better huts of Nandi type, sometimes with unplastered walls; and an intermediate form may be seen, with a nearly flat roof. 342 [177]

D. THE MAGICO-RELIGIOUS ASPECT OF ECONOMIC

That the Dorobo had hunting magic is certain: old men say that some had it, while others had none; my friend Arap Miniŋ, for example, says he was one of those who had none. Since hunting is the one phase of Dorobo life that appears to be gone for ever as a result of government action (in spite of sporadic individual activities), this important aspect is, I fear, irrecoverable. 224 [178] [648]

/241 cont./

V.

000 Pregnancy. -- Behavior of the pregnant woman and her husband. -- Care and treatment of the pregnant woman, the woman in labor, and the woman in childbed. -- Killing newborn children. -- Fertility. -- Child mortality.

843 [842] [824] The opinion that the author heard expressed a number of times by Asá-Wandorobo, that pregnancy is more or less bound up with a definite time of year, and, to be sure, in such a way that either conception takes place at blossom time or birth takes place at the time of the fruitage of the poisonous tree Acocanthera abyssinica, appears surprising.

[224] /242/ During his wife's pregnancy the husband does not pursue a game animal shot at in hunting, because it is believed that the latter, at his approach, will resist the poison and escape. Therefore, after he has shot an animal, he returns to the camp and from there sends another man out to look for the animal. The pregnant woman [825] may not be beaten. Neither he nor the pregnant wife may step over a procession of migrating ants. She is forbidden to eat meat from a wild animal that died or was killed by a predatory animal, likewise soup, and furthermore honey in which dead bee larvae are found. She must avoid coming near a chameleon or a snake, or exposing herself to the heat of the sun for any length of time. All this, in the opinion of the Asá, would harm the fetus.

[302] [202] If the woman visits another camp, she smears her forehead with white clay beforehand in order to announce her condition to its occupants. On the way there she is accompanied by a little girl, [858] whom she leads by the hand. As the reason for this, the people [825] say that a miscarriage would take place if the woman went without a girl and on the way saw the previously mentioned weaver bird or heard its dil-dil-dil calls. A woman pregnant for the first time is 843 given gifts by all the people (men, women, boys, girls) of the camp • 431 and her friends in the neighboring camps at about the middle of her pregnancy. She is presented with a leather apron, a pair of ear pendants, beads, chains, or even a head of small livestock.

/261 cont./

is present at all. The heir of the warrantor is also liable. The giver is offended by a refusal to accept a gift. A counter-gift of approximately the same value follows gift-giving. The giver spits upon the gift when he hands it over. The Wandorobo never conclude into blood friendships among themselves, but only -- and, to be sure, very rarely -- with members of other tribes. The ceremony observed for this resembles the one described above among the Masai. If a stranger has bought ivory from him and paid only part of the price, the ol doroboni often likes to conclude blood friendship with him because he thinks that then the debtor must die if he does not repay the debt as quickly as possible (1).

1. This view is in general rare; it was not originally peculiar to the Asá, but adopted.

As among the Masai, the legal view makes no distinction between murder and manslaughter, but indeed between the latter and negligent homicide. A murderer caught in the very act is subject to blood revenge, for the execution of which every man belonging to the family of the one murdered and in some districts also any of his friends and campmates are justified. If the avengers do not succeed in capturing the murderer on the day of the murder, /262/ the latter is safe from blood revenge, for people see in the unsuccessful search for him a command of God to let him live. To atone for his deed, however, he must pay the principal heir of the deceased one large and two small ivory tusks. Negligent homicide is punished by the payment of a medium-sized ivory tusk. If the perpetrator and the one who was killed belong to the same lineage, the punishment is considerably less than if they are from different lineages of the same tribe. On the other hand, if the two belong to different tribes, the ones entitled to blood revenge often hand over the execution of it to the Masai, who kill the perpetrator, even if they do not capture him until after several months. Up to the completed payment the perpetrator is regarded as puni-andgt, corresponding to the ol oikobani of the Masai. If an Asá kills a Masai blacksmith, the deed remains unpunished because the blacksmiths are too weak for revenge and the Masai would

6:Huntingford E-5 (1938-1939) 1953 FL6 Dorobo FL6

805 [221] [224] [132] The Dorobo divide the year into two parts, *Muainonik*, the dry season, when they used to go hunting the bigger game with bow and arrow; and *Iuot*, the wet season, when they set traps. Each season covers roughly half the year, the rain beginning to tail off in September and getting less and less till January, and then starting to work up again in March, reaching its peak about May; so that *Muainonik* comprises our months of October to March, and *Iuot*, April to September. The Dorobo have twelve months, all but two having the same names as the Nandi months, but they do not synchronize [4]:

Dorobo names:	Nandi names:		
Kipiriruo	*Kipsundet*	October	
Kipsundet	*Kipsundet oiew*	November	
Kipsundet ake	*Mulkul*	December	Muainonik
Mulkul	*Ngotiotet* *	January	
Ngotiotet *	*Kiptamo*	February	
Kiptamo	*Iwat kut*	March	
Iwat kut	*Waket*	April	
Waket	*Ngei* *	May	
Mamut	*Rop tui*	June	Iuot
Rop tui	*Puret*	July	
Pureto	*Epeso*	August	
Yepeset	*Mulkul oiew*	September	

132 The average rainfall at Kapchorua Farm, about two miles below the edge of the forest for the years 1929 to 1937 was 54.09 inches, the maximum being 66.17, the minimum 28.61. Details are given in the Appendix. In the forest itself I think the rainfall is undoubtedly a little higher, perhaps amounting to another 2-3 ins. in the course of an average year.

821 The Dorobo seem to have a better weather sense than the Nandi, and I found that they were generally accurate when making a forecast, whereas the Nandi are usually wrong when they try to foretell the weather. This weather sense is perhaps one of the reasons for their reputation among other [791] tribes as rainmakers; for these Dorobo not only say that they have no rainmakers, but I could find no trace whatever of rainmaking activities, nor any hint that they ever had any. Climatic conditions are such, however, that in a hunting economy rainmaking is not a necessity.

● 433 [311] [325] The environment of the Dorobo provides them with food, skins, wood, and other vegetable materials. Iron they had not, and they still have no knowledge of ironworking, though they use iron implements. Their activities comprised hunting, trapping, food-gathering, hut-building, the production of honey, and the making of objects of wood, leather, and grass, such as traps, arrow-shafts, bows, honey-barrels, clothing, caps, baskets, and handles for tools 439 Objects of iron they have got for as far back as they can remember from the Nandi by exchange for such things as they can make or produce themselves.

104 [4] Throughout this paper I have written the velar nasal by the sign n, representing the "long-tailed n". In words marked * the first consonant is the velar nasal.

6:Huntingford E-5 (1938-1939) 1953 FL6 Dorobo FL6

father (if he lives nearby), to his brothers, and lastly, if there is any over, to his clansmen in the settlement; so that a man who gets a pound or so of Nandi tobacco does not keep much of it for himself.

Drink, mainly in the form of honey-wine, is prepared not so much for private consumption as for social gatherings. It is used in various magico-religious performances, and as part of the bride-payment. When a man is visited by a friend or two, he gives them honey-wine; when there is a clan council, honey-wine is drunk; and when men and women meet for a wedding or a naming they drink honey-wine. It is thus an indispensable part of Dorobo social life. When a man wants to relax, he lies down and goes to sleep; but his amusement is composed of social gatherings. Visiting, ceremonials, and clan councils in fact provide him with his entertainment, and conversation and gossip seem to take the place of games and dances. I saw no sign whatever of the game called *kecuiek* by the Nandi, which is played with seeds or pebbles in holes in the ground or in a board, and never heard it mentioned. I neither saw nor heard of a dance, and I never once heard a Dorobo of either sex singing.

The principal standard of wealth is really a man's skill as trapper, hunter, and bee-keeper. But the products of this skill are perishable, and formerly the only way in which tangible wealth could be accumulated was in the form of weapons, honey-barrels, and dogs. Now that the old hunting conditions have gone, it is becoming possible for a man to accumulate wealth to a very limited extent in cattle or goats, which he can get by purchase, gift-exchange, or through bride-payment. The use of money has just become familiar, and a certain number of Dorobo earn wages; but except for one or two who have joined the Police, wages are not high, and the average in 1939 was 7 to 10 shillings a month. So far the Dorobo have had little inducement to work for wages, except that by signing on as squatters for a small wage they can acquire a temporary right to live on what was their own land. Beyond the fact that money enables them to buy a little extra food, our idea of wealth means little or nothing to them, and they have not yet advanced far enough into the transitional stage for it to be anything more than a small supplement to their traditional way of living. It is all that they can do to maintain themselves, let alone accumulate reserves or surplus wealth.

The transitional stage which the Dorobo had reached by 1939 is that from hunting to agriculture, with at the same time a strong desire to acquire cattle. It is sometimes suggested that hunting peoples like the Dorobo are really agriculturalists or pastoralists who have had to give up their agricultural or pastoral way of life and take to hunting. This may be true of some, such as the 'false Dorobo' in parts of Kenya who are merely outlaws and fugitives from various tribes. But it is quite clearly not true of the real Dorobo [1], like those who form the subject of this paper, who are unmistakably non-pastoral and non-agricultural. Their basic hunting tendency is shown by their character and behaviour, by their hunting techniques and skill, by

[1] Cf. my remarks in JRAI 59. 1929. p. 378.

6:Huntingford E-5 (1938-1939) 1953 FL6 Dorobo FL6

the absence of pastoral and agricultural techniques and vocabulary, by their myths, and in fact by everything about them. To-day it is true that they are becoming agriculturalists, as the following analysis of their economic activities will show:

		Past:	→	Past:	→	Most: (in most cases)
Family	Men:	Trapping game in the forest		Cultivation of shambas		Stock
		Making weapons, honey-barrels, etc.				
		Some: working for wages				
	Women:	Preparing the results of trapping		Cultivation of shambas		
		Making baskets, skin clothes, etc.				
		Housework and food collecting				
	Children:	Weeding				
		Herding				
		Housework				
Men Living Alone:		Trapping		Cultivation of shambas		Stock
		Making things				
		Preparing the results of trapping				
		Cooking, housework				

Dorobo life therefore converges on cultivation, with a hunting background, and stock in view as the ultimate achievement. For though the hunting instinct is still very much alive, and though a great deal of time is now spent on cultivation, there is no doubt that the Dorobo (in 1939 at least) had a livestock economy in their minds as the ultimate goal.

2. Economic Activities

a) Bee-keeping

Honey is to the Dorobo what milk is to the Nandi. It is semi-sacred and has a high ritual value, in consequence of which certain rules must be observed lest the supply fail. A person must not eat fruit or blood on the same day that he has eaten honey, though he or she may eat meat. After eating honey, bits of the comb must not be left lying on the ground, but must be hidden in the undergrowth. Arap Minin said, somewhat unconvincingly, that the reason for this was "that other people shall not see them and so be led to your honey-barrel". But this is probably not the true reason, which may be either simply respect to the honey, from a fear that if treated disrespectfully the supply will fail; or else fear of a witch putting a spell on the bees or honey

6:Huntingford E-5 (1938-1939) 1953 FL6 Dorobo FL6

is to get as much as possible of the crop out of the way so that ploughing can start at once without having to wait till the crop is ripe. But the Dorobo had, all the same, made a step forward, for a solid, compact stook is less likely to be devastated by animals than plants standing scattered over a field.

By 25 November, 1938 the Kipukua people had reaped their crops. The shamba here was about an acre in extent, and was divided into four approximately equal-sized plots. There was little maize, for some had been eaten on the field and some had been destroyed by vermin; what was left had been stooked, and anything like an accurate estimate was impossible, though there might have been two or perhaps three bags in the stooks. If we estimate that the equivalent of two bags might have been eaten, and two more destroyed by vermin, we have about 6 or 7 bags, a somewhat high estimate for a crop grown mixed with eleusine, but not impossible [20]. Of eleusine, one plot yielded 3 bags, and another 2 bags (that is 5 bags from half an acre), not a great deal, certainly, but a fair yield under such conditions, and most useful as food, for the Dorobo eat most of their eleusine, and turn very little of it into beer. Maize and eleusine are ground by crushing on slabs of granite (*liteito*), and the resulting meal is made into gruel (*musarek*) for the children, and stiff porridge (*kiniet*) for the older people; it is generally eaten with a mess of vegetable food (*inguek*) prepared separately.

Storage of crops is not yet a very difficult problem. A few of the Dorobo, it is true, have built granaries of Nandi type, hidden just inside the forest to prevent thefts by the Nandi, for anyone can lift up the roof of such a granary in the night. But since so much of the maize is eaten on the field, what is left at harvest time can be stored in the loft; and the same applies to eleusine, for it does not yield a large amount of grain. I saw no millet growing, and the Dorobo said they bought it from the Nandi.

As we have already noted, agricultural labour is divided to a certain extent between the sexes, but the distinction is not very sharp, and it was found to work out in the following way:

Men:	Both:	Women:
Heavy preliminary work	Digging	
Planting	Weeding	Collecting and burning weeds
	Reaping	

The heavy work includes lopping off branches in the Nandi manner, clearing bushes, and breaking up the ground when hard. Women may also plant, but the tendency seems to be for men to do it, though there is no absolute rule against women planting. Children help with the weeding, and herd the goats when there are any; old men herd cattle, and women also sometimes herd goats.

The Dorobo had not by 1939 acquired the Nandi belief that each eleusine crop requires new land, which in the circumstances is just as well; but they do not hesitate to give up using land which is unproductive. Thus,

[20] The bag is the standard 2 ½ lb. gunny bag used in East Africa, holding 200 lbs. of maize.

[P. 192, A]

Both the social and the economic ranges of the Dorobo are very narrow. The family is a self-supporting unit, and a group of families forms a social unit; but the group is isolated, and the groups cohere through their strong clan solidarity and strict exogamy. There is no "tribe" as e.g. the Nandi, but a collection of family or clan groups forming a *koret* or district, and a collection of such groups within a given area having a common organization, customs, and dialect, and the innate idea that "we are the Dorobo of such-and-such a place." Thus the Kapchepkendi Dorobo (with whom this paper deals) distinguish themselves from the Dorobo living on Tindiret hill, though that hill is only some seven miles from Sosoiyo. (See map of the Dorobo country.) Before the Government dispersed them, the Dorobo possessed, more or less undisturbed, the whole of the forest. Now they have no land at all. But they maintain their solidarity in spite of disruption, by means of their isolation, strong clan-system, and the fact that outsiders, e.g. the Nandi, are half afraid of them (so long as they do not go into Nandi), as being rainmakers and magicians of no mean ability, a people who are, in fact, somewhat uncanny. Their external relations may be described under three heads as (1) acquisitional: exchange of goods and services with the Nandi, and, till about 80 years ago, with the Vasin Gishu Masae; (2) restrictive: the Government raids them for taxes, and takes away their land, which leads to (3) an attitude of deep suspicion towards all Europeans, though they are driven by economic pressure to work for them.

Productive activities are concerned with the following:

A. *Food*: meat (by hunting and trapping), honey, wild plants, eleusine and maize (grown or obtained), milk, maize meal, salt and beer.

B. *Non-edible*: houses, weapons, implements, utensils, clothing and ornaments (except of iron), firewood, traps, honey-barrels, coloured earth (which is dug in the eastern part of the forest and sold to the Nandi for cash.)

C. *Raw Materials*: wood, plants, and skins.

The exchange of their own products for things they do not make is governed by natural resources,

[P.192, B]

and by personal ability, and therefore to some extent by their geographical setting. They have no iron ore, no metallurgic knowledge, and so all ironwork is imported from the Nandi. Tobacco which they like, is not grown as yet, and this too must be obtained from the Nandi. There is a regular exchange of honey, skins, and baskets, for arrowheads, knives, tobacco, seeds, pottery, etc., and a scale of exchange values has come into existence:

1 arrow head is given for a gourd of honey.
1 bundle of tobacco is given for a bag of honey.
1 large pot is given for a large bushbuck skin.
1 small pot is given for a duiker skin.
2 basketfuls of seed for one basket.[1]

Sometimes personal services are given, e.g. a day's weeding in the smith's garden for two knives.

Cattle are obtained from the Nandi, to a limited extent, by a system of gift exchange for furs. The Nandi make friends with the Dorobo chiefly for the purpose of getting honey, and the Dorobo will give some to his Nandi friend without expectation of an immediate return. Presently the Nandi gives the Dorobo a goat, and this exchange of gifts paves the way for further and more important transactions: eventually the Dorobo offers his friend a fur cloak for an ox, as e.g. my friend Arap Miniŋ acquired one from a Nandi called Kapkile at Ollesos; he also got another in exchange for 7 goats, which he bought out of his wages for working on a farm.

C. Techniques

1. Hunting

The dry weather, ***mwainonik***, is the shooting season, and the wet weather, ***iwot***, is the time for trapping. The weapon is the bow and arrow (spears are not used by the Kapchepkendi Dorobo), and the hunters use dogs.

In wet weather buck are caught in traps. In the dry season, wild pig of various kinds[2] were

[1] A honey-bag is about 12 ins. deep, and 8 ins. wide; it contains about twice as much honey as a gourd. A basket (kerepet) is about 6 ins. deep and 6½ ins. wide at the top.

[2] *Tumda*, the wart-hog (Phacochoerus aethiopicus); and *Toraet*, the giant hog or bush-pig (Hylochoerus Meinertzhageni).

1:Huntingford E-4, 5 (1938-1939) 1953 FL6 Dorobo FL6

tree," *rotinuet* (*higelia æthiopica*); and *maiyek*, eleusine beer, made, though seldom, in the Nandi way. They also drink a mixture of honey and water called *lohomek*.

Trade and Exchange

The inability of the Dorobo to produce many of the things they need has led to the development of a system of exchange with the Nandi, who till recently were almost the only people with whom they had dealings. Relations between Dorobo and Nandi have been such that, though maintaining their complete independence, the Dorobo have not only obtained goods by trade, but have acquired and assimilated much Nandi culture, including language, clan-names, agriculture, and many material features like dress and ornaments. Their relations are in general friendly, for the Nandi like honey and furs which they get most easily from the Dorobo, and there has been an increasing number of marriages of Dorobo men with Nandi women, as well as of Dorobo women with Nandi men. But neither side takes liberties with the other: the Dorobo fear the physical superiority of the Nandi, and the Nandi fear the close-to-nature life of the Dorobo, as well as a certain mystical force as rain-makers which they attribute to them.

From the Nandi the Dorobo get objects of iron, pottery, beads, tobacco, cattle (see below, p. 61), and the seed of cereals for planting. The Nandi get skins and honey from the Dorobo. There are no special places for trade, but the Dorobo go to the nearest smith or potter or other person who can supply them, and make their bargains. This means a journey into the Nandi Land Unit, but other things can be got from the nearest friendly Nandi. The exchange values in 1939 were:

1 axe for 1 bagful of honey;
1 bundle of tobacco (about 1 lb.) for 1 bagful of honey;
1 arrowhead for 1 gourd full of honey;
1s. worth of trade beads for a gourd full of honey;
1 knife for a day's weeding in the smith's garden;
1 large earthenware pot for 1 large prepared buck skin (usually bush-buck)
1 small earthenware pot for 1 small prepared buck skin (usually duiker);
2 baskets of seed for planting for 1 new basket.

The bag, *motoket*, is made of skin and measures about 8 ins. by 7 ins.; the gourd is about 10 ins. long; the large pot is about 20 ins. high, the small pot about 10 ins. high; and the basket is about 6 ins. deep and 6 ins. wide.

Cattle

The Dorobo interest in cattle is probably due to their long contact with the Nandi; but though they desire cattle, they have not the land for them. Yet they have speculated about cattle inheritance, and by 1939 had worked out theoretical rules which they had scarcely had opportunities of testing. When they were evicted from the forest in 1937 they were officially credited with about 2,000 head of cattle; but no census of either people or stock appears to have been made in preparation for this event, and most of these cattle did not belong to real Dorobo. In 1938–9 the numbers of stock which I counted during the compilation of my census were:

	Cattle	Goats	Dogs
Koret of Kipkorom ..	25	15	4
Koret of Sosoiyo ..	54	19	3
Koret of Kelpui	11	0	0
	90	34	7

Methods of cattle-management are based on those of the Nandi.

6:Huntingford E-5 (1938-1939) 1953 Fl6 Dorobo Fl6

wants it, i. e. as the loose end gets thin, a new end is shoved under the binding; the bast is kept handy in a bundle. The technique is a spiral foundation with a flat, then gradually ascending coil, of the simple over-sewn type, and bee-skep variety, the stitches being spaced out and not close together. The base of the basket is formed of six fibre coils, sewn together with bast. A hole is made with the needle, and the bast is pushed through it. At frequent intervals the fibre and the bast are moistened with the lips. After the first six coils, a slight rise is made: as each coil makes a complete circle it is slightly raised in order to make the bend between the base and the sides. When a new piece of bast is needed it is shoved right through the hole, leaving about ½ to 1 inch on the other side, and is sewn through as before. The basket maker works with lengths of bast of 6 to 12 inches. The fibre coil is of about the thickness of a pencil, and this must be maintained. When the length of fibre is reduced to about 2 ft. it begins to get thin, and some new strips must be added by chewing off a further length. The structure of the basket is thus, in effect, a continuous coil of compressed fibre, each line of coil tied to the next by stitches of bast. Sometimes the base is made of a circular piece of leather, to which the first coil is sewn, the rest of the procedure being the same as for the all-fibre basket. 285

The dressing of skins, including those used for exchange, is a simple process, for no chemical agent is applied. The newly layed skin is tightly pegged out on the ground while it is still wet and left to dry in the sun. When dry, it becomes stiff, and in this state it is rubbed with an axe-blade held at an angle of about 20°, the blade being rubbed backwards and forwards till the skin is soft and supple. If it is to be used for a woman's garment or other object in which fur is not needed, both sides are rubbed. Skins are dressed by women. Apart from clothing, the chief objects made of skin are bags, quivers, and parts of tobacco-boxes. The material used for sewing is generally pig-gut. The needle of course has no eye, and the method of sewing is therefore to make a hole with the needle and then push the gut through it. Bags, *motoket*, are used for many purposes, including the carrying of honey and coloured earth. They are generally made of antelope skin (e. g. blue duiker), and unless intended for honey the fur is left on the outside. They are provided with a flap, a strap for fastening and a sling for carrying them from the shoulder. A common size is 7 ins. by 6 ½ ins., but I have seen them as big as 18 ins. by 16 ins. Tobacco-boxes are made from internodes of bamboo, but they have leather covers at each end, and a thin leather strap is sewn to the covers so that the owner can sling the box round his neck. 281 [462] [415] 283 [412] 415 [825] [276]

The nature of Dorobo life demands exchange of products with the Nandi. The most important of the products they get by exchange is ironwork; other things are pottery, beads, tobacco, cereal seeds, and cattle, and a fairly definite, though possibly fluctuating, scale of exchange values has come into existence. In 1939 some of these values were: 434 435

1 axe for 1 bagful of honey.

1 arrowhead for a gourd full of honey.

2 knives for 1 day's weeding in the blacksmith's shamba.

6:Huntingford E-5 (1938-1939) 1953 FL6 Dorobo FL6

435 1 bundle of tobacco (about 1 lb.) for 1 bagful of honey.
1 large earthenware pot for 1 large prepared antelope skin.
1 small earthenware pot for 1 small prepared antelope skin.
2 baskets of cereal seed for 1 basket (*kerepet*).
1/- worth of trade beads for 1 gourd full of honey.

[804] The bag used as a measure for honey is the smaller size of *kerepet*, measuring 7 or 8 ins. by 6 ½ or 7 ins. The gourd is about 10 ins. long. The large pot stands about 20 ins. high, the small, about 10 ins., and the large antelope skin is usually a bushbuck, the small one a duiker.

437 There are no special market places or places of exchange. The Dorobo
439 go to the nearest smith or potter and make a bargain, returning later with
[443] the exchange equivalent to collect the goods. There is no language difficulty
[197] in these transactions, for the Dorobo language is no more than an easily understood dialect of Nandi. Getting iron or pottery means going into the Reserve, but to get seeds, tobacco or beads they need only go to the nearest friendly Nandi who has what they want and is willing to make the exchange. Sometimes plant material of medicinal value (i. e. what they think is medicinal value) is substituted for some of the regular exchange articles, but the above list represents the ordinary practice. When Dorobo have money with which to buy what they want instead of exchanging goods, they have the choice of going to the shops at either Songhor in the south, or else at Aruos in the Nandi Reserve, where there is a collection of Indian shops. The men do not
[562] like their womenfolk to go to these places unescorted, but occasionally some of the bolder ones try to slip away unobserved to Aruos; they seldom go to Songhor, as it is in the European area.

476 No human group can exist without some form of co-operation, and even when a man lives alone, as he may have to among the Dorobo, he is not because of that cut off from or unable to share in the activities of his horde. Within the family people are interdependent, and in the settlement they help each other. The main activities in which people normally co-operate are four in number: 1. House-building; 2. Hunting; 3. Digging earth; 4. Cultivation.
[462] (1) Building huts is women's work, which a man will do if he has no wife, and
[224] for which he will get help from a relative or clansfellow. (2) When people hunted game they usually went out in parties, and the kill was shared among
[317] them. (3) Digging earth means a journey of anything up to 16 miles round the edge of the forest and into country where nowadays there are strangers, so people find it both safer and more convenient to go in parties, for though they are in no danger of being attacked, their unconquerable shyness demands numbers to give
[241] confidence. (4) In a family or clan group, though each individual has his own shamba, he will expect both to help and to be helped by the other members.

[276] Together with the spirit of co-operation is the rule of joint consumption. We have already seen how meat is shared according to definite rules; and among the Dorobo certain other things which are hard to come by must also be shared. The chief of these is tobacco, of which when a man has acquired even a small supply, he is supposed to give some to his father, to his wife's

Huntingford E-5 (1938-1939) 1953 FLÁ Dorobo FLÁ

Fig. 8. A Simpler Kind of Springe. This trap has no "trigger-peg". The animal treads on the platform and by so doing presses it against the upright K to which liana *b* is attached, thus releasing the liana and allowing the bent stick D to spring upright and tighten the noose round the neck of the quarry.

when an animal treads on it, allowing the liana to slip over the top and thus release the bent stick D.

Hunting parties might be made up by as many as eight men, though I think that probably four or five was a more usual number. A common practice was for half the party to work along one bank of a stream and the rest along the other bank, so that if there was nothing on one side, those on the other side might be more successful; or if the quarry got across the stream, the men on the other side would be able to deal with it. When a kill was made all the hunters assembled. The animal was skinned, the meat cut up, and some of it eaten on the spot, either raw, or partly cooked by laying it across a rough wooden framework over a fire. The rest of the meat was divided among them and taken home. In the best days, when meat was plentiful, what was left over was dried and kept either as a reserve or else exchanged with the Nandi for eleusine and millet. A stack of dried meat (*sirikeniot*) about 2 ft. square, was sold for about 25 lbs. of grain. Meat is cut into strips (*sir*, whence *sirikeniot*) which are laid out on the drying tray or loft over the fire to be smoke-cured after being dried on the roof of a hut or in the fork of a tree.

c) Agriculture

Since they can no longer hunt, and present conditions are[18] not favourable for the acquisition of cattle on a large scale (even if the Dorobo had the means of so doing), the adoption of agriculture has become an economic necessity, and methods, implements, and seed have been obtained from the Nandi. This change from hunting to agriculture has taken place virtually between the years 1927 and 1938. In the first of these years the area cultivated by them was so small as to be negligible; but by the latter year their lives were, as we have seen, to a great deal centered on agriculture. And as with hunting in the old days, so with agriculture to-day, the growing of crops is naturally regulated by the wet and dry seasons and the main divisions of the agricultural year are:

January to April: preparation of the land.
April-May: planting.
September: reaping.

[18] This refers to the years 1938-39.

6:Huntingford E-5 (1938-1939) 1953 FLA Dorobo FLA

241 The planting and reaping periods vary according as the rains are early or late.
[221] Between them there is a time when the crops have to be weeded, and after that for two or three months a time when little need be done to the crops but guard them against animal depredations.

The Dorobo grow two main crops, *pik* or *poisk*, eleusine coracana (commonly known in Kenya as *wimbi*), a short gramineous plant bearing a head composed of small grains; and *chemdek*, maize. Millet had not been
[435] adopted by 1939 as a cultivated crop, and when wanted had to be bought from the Nandi. As a subsidiary crop, sweet potatoes, *rujowsik*, are grown to a small extent.

[412] Implements are confined to the hoe (*mukombet*), axe (*ndolet*), and ordinary knife (*rembolnet* or *rutwet*), though the use of the *panga* or cutlass
[439] is spreading. Hoe-blades (made by Nandi smiths) and *pangas* (sold by traders) are got from the Nandi in exchange for baskets, honey, or skins. The bill-hook, though used by the Nandi had not been adopted by the Dorobo in 1939.

The ground is prepared in the same way as by the Nandi. The top soil is dug with the hoe, collected into small heaps, and fired; it is left smouldering for several days and the burnt earth and vegetable ash are then spread over the plot and dug in with the hoe. Seed of maize and eleusine is
[434] bought from any Nandi who is willing to sell it, usually one of the numerous
• [435] squatters on the nearby farms[19]. The Dorobo get two basketfuls in exchange for one basket. Potatoes (when not got in the same way) are generally grown by themselves, but maize and eleusine are planted together in the same plot so that the eleusine grows up between the maize plants. Maize has thus to be sown wider than is really economic, but it is a Nandi habit, and in favour of it one may say that the intervening spaces are partially covered and thus there is a chance of preventing some erosion in the early stage when the ground is clean, for when the crop is a few inches high, people turn out to weed, a process repeated if the land gets very dirty.

[417] Each shamba is surrounded by a fence made of thorns and bushes, with occasional posts to strengthen it where necessary, and trees or stumps are included in the fence when they occur in suitable positions. Sometimes there is a gate formed of movable upright poles, like the gate of a Nandi cattle enclosure, but usually the line of fence is unbroken, and access is by way of a rough stile of logs laid across the thorns.

243 Eleusine is reaped in the Nandi fashion by cutting off the heads with a knife, the straw being left to be trampled down and eventually dug in — that is, if the shamba is to be planted again. Maize is picked by hand, but in 1938 it was largely eaten on the field as the cobs developed, so that by the time it was fully ripe there was not much left to reap. By 1938, however, some
[197] Dorobo at Kipukua, noticing the European practice of stooking maize in rows before it is ripe, cut and stooked their own in the same way, though they did not understand why it was done by the Europeans, whose object

[19] A Squatter is a "resident native labourer" living on a farm under contract with the employer.

241
[341]

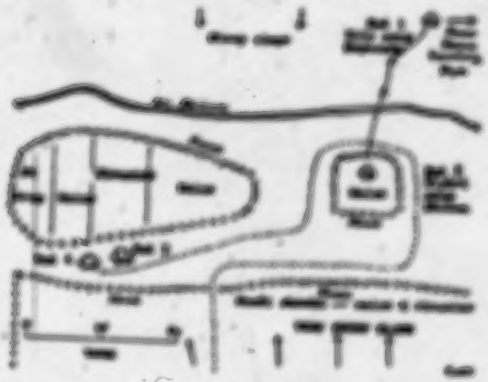

Fig. 4. Plan of a Dorobo shamba at Kolpot alongside a Nandi shamba.

at Kipsikus in 1938 the crop was so much damaged by monkeys, pigs, and a sort of mole called *kowoiet*, that the original shamba had to be given up, and the occupiers took up new and separate plots elsewhere. Sometimes a Dorobo has a shamba all to himself; more often, however, several people divide the area inside a fence, each contributing to the labour of making it; and in some cases Dorobo share part of a fenced shamba with Nandi (Fig. 4).

[448]
317

Though not connected with cultivation, we may mention here the subject of earth digging, because it is concerned with the ground. Red and white earth is found near Timboroa (or *Tembaroa*, as the Dorobo call it), and men go in parties of four or five to dig it. They use nothing but a digging stick, *kamet*, made of a sharpened stake, and the earth is carried home in large leather bags. In former days, when other Dorobo lived in the earth-producing area, a digging party would ask leave to dig from the man who hunted over that tract of land, and though no fee seems to have been paid, it is said that if a man should refuse his consent, the party would go home without digging. But as no Dorobo now live there, this could not be verified. To-day the Dorobo sell coloured earth to the Nandi, who pay them at the rate of 2 shillings for a large bag of earth. Red earth, *ondoit*, is used mixed with fat (or sometimes cassava oil) for rubbing on the head; white earth, *emeriot*, is used as a magical remedy in cases of homicide.

(b) Cattle

231
177
181

If the Dorobo had not been in such close contact with a people whose primary interest in life was cattle, it is possible that they would have contented themselves with agriculture and no live stock. But their relations with the Nandi have inevitably led them to take an interest in cattle, and to think that the possession of cattle is a desirable thing. Therefore they are slowly trying to acquire cattle, and are in process of making them their ultimate objective. But

[552]

6:Huntingford E-5 (1938-1939) 1953 FLÁ Dorobo FLÁ

father (if he lives nearby), to his brothers, and lastly, if there is any over, to his clansmen in the settlement; so that a man who gets a pound or so of Nandi tobacco does not keep much of it for himself.

Drink, mainly in the form of honey-wine, is prepared not so much for private consumption as for social gatherings. It is used in various magico-religious performances, and as part of the bride-payment. When a man is visited by a friend or two, he gives them honey-wine; when there is a clan council, honey-wine is drunk; and when men and women meet for a wedding or a naming they drink honey-wine. It is thus an indispensable part of Dorobo social life. When a man wants to relax, he lies down and goes to sleep; but his amusement is composed of social gatherings. Visiting, ceremonials, and clan councils in fact provide him with his entertainment, and conversation and gossip seem to take the place of games and dances. I saw no sign whatever of the game called *kerwiek* by the Nandi, which is played with seeds or pebbles in holes in the ground or in a board, and never heard it mentioned. I neither saw nor heard of a dance, and I never once heard a Dorobo of either sex singing.

The principal standard of wealth is really a man's skill as trapper, hunter, and bee-keeper. But the products of this skill are perishable, and formerly the only way in which tangible wealth could be accumulated was in the form of weapons, honey-barrels, and dogs. Now that the old hunting conditions have gone, it is becoming possible for a man to accumulate wealth to a very limited extent in cattle or goats, which he can get by purchase, gift-exchange, or through bride-payment. The use of money has just become familiar, and a certain number of Dorobo earn wages; but except for one or two who have joined the Police, wages are not high, and the average in 1939 was 7 to 10 shillings a month. So far the Dorobo have had little inducement to work for wages, except that by signing on as squatters for a small wage they can acquire a temporary right to live on what was their own land. Beyond the fact that money enables them to buy a little extra food, our idea of wealth means little or nothing to them, and they have not yet advanced far enough into the transitional stage for it to be anything more than a small supplement to their traditional way of living. It is all that they can do to maintain themselves, let alone accumulate reserves or surplus wealth.

The transitional stage which the Dorobo had reached by 1939 is that from hunting to agriculture, with at the same time a strong desire to acquire cattle. It is sometimes suggested that hunting peoples like the Dorobo are really agriculturalists or pastoralists who have had to give up their agricultural or pastoral way of life and take to hunting. This may be true of some, such as the 'false Dorobo' in parts of Kenya who are merely outlaws and fugitives from various tribes. But it is quite clearly not true of the real Dorobo[9], like those who form the subject of this paper, who are unmistakably non-pastoral and non-agricultural. Their basic hunting tendency is shown by their character and behaviour, by their hunting techniques and skill, by

[9] Cf. my remarks in JRAI 59. 1929. p. 278.

61Huntingford E-5 (1938-1939) 1953 FL6 Dorobo FL6

barrel so that the smoke goes inside and the bees come out. He then takes out what honey he wants, wraps it in the leaves he has brought, and descends, carefully extinguishing the tinder when he has reached the ground. Though sometimes the barrels are not more than a few feet from the ground, very often the process of taking honey means a climb of eighty feet or so with no help but the unsteady ladder already described.

Although honey has great ritual and social value, like milk to the Nandi, it cannot be said that bees take the place of cattle in the daily life of the people, for they require and receive no care beyond the provision of barrels and the due observance of the taboos concerning honey, and there is really no need to know very much about them. But as producers of honey, bees provide material for food, drink, and ritual, and they are thus of some importance. Honey, too, is a much-used medium of exchange. Without honey, Dorobo life would be vain and empty.

b) Hunting

In the past, hunting was the chief occupation of Dorobo men, and though they hunt but little now, confining their activities to trapping, they have still a "hunting outlook". The conversation of Dorobo walking through the forest sooner or later turns on the animal life around them, for as we have already noted, they have what the Nandi call *comiet*, which one might almost render 'affinity', with the beasts of the forest. The sort of talk that goes on in the forest is something like this sample, which I took down after hearing it :

A. *Kelich aṗ tiowik.*
The-feet of the-animals.

B. *Iro, ni poinot, puuu yo, wendi yo.*
Look, this-one (is) the-bushbuck, it-comes-from over-there, it-goes over-there.
Miniu, a ma miniu miniu, tinye lakuennyi kitchin.
Small, but not small very, it-has its-child small.

A. *Cecok cuto tiowik, mii samakiannyon; acoma*
(They are) ours these animals, they-are-in our-forest; I-like (the things)
cepo samak.
which-are-of forest.

B. *Ingeeuwen ulinio timin, apdre mii tiond ake. Ne*
Let-us-look over-there (in) that-forest, perhaps there-is the-animal another. What
ni ne kuikuioti orii?
(is) this that creeps-about inside?

A. *Apdre tumia.*
Perhaps the-giant-pig.

B. *Weiis, asuweni matit. Ingoatinye kuyanda apdre no. A mamii*
Yes, I-see the-head. If-I-had the-bow I-kill that-one. But there-is-
kuyanda.
not-here the-bow.

A. *Ingeeuwen ole mwe.*
Let-us-see where it-escapes-(to).

and by personal ability, and therefore to some extent by their geographical setting. They have no iron ore, no metallurgic knowledge, and so all ironwork is imported from the Nandi. Tobacco, which they like, is not grown as yet, and this too must be obtained from the Nandi. There is a regular exchange of honey, skins, and baskets, for arrowheads, knives, tobacco, seeds, pottery, etc., and a scale of exchange values has come into existence:

1 arrow head is given for a gourd of honey.
1 bundle of tobacco is given for a bag of honey.
1 large pot is given for a large bushbuck skin.
1 small pot is given for a duiker skin.
2 basketfuls of seed for one basket.[1]

Sometimes personal services are given, e.g. a day's weeding in the smith's garden for two knives.

Cattle are obtained from the Nandi, to a limited extent, by a system of gift exchange for furs. The Nandi make friends with the Dorobo chiefly for the purpose of getting honey, and the Dorobo will give some to his Nandi friend without expectation of an immediate return. Presently the Nandi gives the Dorobo a goat, and this exchange of gifts paves the way for further and more important transactions: eventually the Dorobo offers his friend a fur cloak for an ox, as e.g. my friend Arap Minig acquired one from a Nandi called Kapkile at Ollesos; he also got another in exchange for 7 goats, which he bought out of his wages for working on a farm.

C. *Techniques*

1. Hunting

The dry weather, ~~*umainonik*~~, is the shooting season, and the wet weather, *imot*, is the time for trapping. The weapon is the bow and arrow (spears are not used by the Kapchepkendi Dorobo), and the hunters use dogs.

In wet weather buck are caught in traps. In the dry season, wild pig of various kinds[2] were

[1] A honey-bag is about 12 ins. deep, and 8 ins. wide; it contains about twice as much honey as a gourd. A basket (kerepet) is about 6 ins. deep and 6½ ins. wide at the top.

[2] *Tumda*, the wart-hog (Phacochoerus aethiopicus); and *Torsot*, the giant hog or bush-pig (Hylochoerus Meinertzhageni).

1:Huntingford E-4, 5 (1938-1939) 1953 FL6 Dorobo FL6

862 [273] true," *rotiaust* (*higelia æthiopica*); and *maiyek*, eleusine beer, made, though seldom, in the Nandi way. They also drink a mixture of honey and water called *lokomek*.

Trade and Exchange

439 [648] [177] [582] [181] [186] The inability of the Dorobo to produce many of the things they need has led to the development of a system of exchange with the Nandi, who till recently were almost the only people with whom they had dealings. Relations between Dorobo and Nandi have been such that, though maintaining their complete independence, the Dorobo have not only obtained goods by trade, but have acquired and assimilated much Nandi culture, including language, clan-names, agriculture, and many material features like dress and ornaments. Their relations are in general friendly, for the Nandi like honey and furs which they get most easily from the Dorobo, and there has been an increasing number of marriages of Dorobo men with Nandi women, as well as of Dorobo women with Nandi men. But neither side takes liberties with the other: the Dorobo fear the physical superiority of the Nandi, and the Nandi fear the close-to-nature life of the Dorobo, as well as a certain mystical force as rain-makers which they attribute to them.

From the Nandi the Dorobo get objects of iron, pottery, beads, tobacco, cattle (see below, p. 61), and the seed of cereals for planting. The Nandi get skins and honey from the Dorobo. There are no special places for trade, but the Dorobo go to [437] the nearest smith or potter or other person who can supply them, and make their bargains. This means a journey into the Nandi Land Unit, but other things can be got from the nearest friendly Nandi. The exchange values in 1939 were:

[435]
1 axe for 1 bagful of honey;
1 bundle of tobacco (about 1 lb.) for 1 bagful of honey;
1 arrowhead for 1 gourd full of honey;
1s. worth of trade beads for a gourd full of honey;
1 knife for a day's weeding in the smith's garden;
1 large earthenware pot for 1 large prepared buck skin (usually bush-buck)
1 small earthenware pot for 1 small prepared buck skin (usually duiker);
2 baskets of seed for planting for 1 new basket.

[415] The bag, *motoket*, is made of skin and measures about 8 ins. by 7 ins.; the gourd is about 10 ins. long; the large pot is about 20 ins. high, the small pot about 10 ins. high; and the basket is about 6 ins. deep and 6 ins. wide.

Cattle

231 [177] [648] The Dorobo interest in cattle is probably due to their long contact with the Nandi; but though they desire cattle, they have not the land for them. Yet they have speculated about cattle inheritance, and by 1939 had worked out theoretical rules which they had scarcely had opportunities of testing. When they were evicted from the forest in 1937 they were officially credited with about 2,000 head of cattle; but no census of either people or stock appears to have been made in preparation for this event, and most of these cattle did not belong to real Dorobo. In 1938–9 the numbers of stock which I counted during the compilation of my census were:

	Cattle	Goats	Dogs
Koret of Kipkorom ..	25	15	4
Koret of Sosoiyo ..	54	19	3
Koret of Kelpui	11	0	0
	90	34	7

[171] Methods of cattle-management are based on those of the Nandi.

6:Huntingford E-5 (1938-1939) 1953 FL6 Dorobo FL6

435 1 bundle of tobacco (about 1 lb.) for 1 bagful of honey.
1 large earthenware pot for 1 large prepared antelope skin.
1 small earthenware pot for 1 small prepared antelope skin.
2 baskets of cereal seed for 1 basket (*kerepet*).
1/- worth of trade beads for 1 gourd full of honey.

[804] The bag used as a measure for honey is the smaller size of *kerepet*, measuring 7 or 8 ins. by 6 ½ or 7 ins. The gourd is about 10 ins. long. The large pot stands about 20 ins. high, the small, about 10 ins., and the large antelope skin is usually a bushbuck, the small one a duiker.

437 There are no special market places or places of exchange. The Dorobo
439 go to the nearest smith or potter and make a bargain, returning later with
[443] the exchange equivalent to collect the goods. There is no language difficulty
[197] in these transactions, for the Dorobo language is no more than an easily understood dialect of Nandi. Getting iron or pottery means going into the Reserve, but to get seeds, tobacco or beads they need only go to the nearest friendly Nandi who has what they want and is willing to make the exchange. Sometimes plant material of medicinal value (i. e. what they think is medicinal value) is substituted for some of the regular exchange articles, but the above list represents the ordinary practice. When Dorobo have money with which to buy what they want instead of exchanging goods, they have the choice of going to the shops at either Songhor in the south, or else at Aruos in the Nandi Reserve, where there is a collection of Indian shops. The men do not
[562] like their womenfolk to go to these places unescorted, but occasionally some of the bolder ones try to slip away unobserved to Aruos ; they seldom go to Songhor, as it is in the European area.

476 No human group can exist without some form of co-operation, and even when a man lives alone, as he may have to among the Dorobo, he is not because of that cut off from or unable to share in the activities of his horde. Within the family people are interdependent, and in the settlement they help each other. The main activities in which people normally co-operate are four in number : 1. House-building ; 2. Hunting ; 3. Digging earth ; 4. Cultivation.
[462] (1) Building huts is women's work, which a man will do if he has no wife, and
[224] for which he will get help from a relative or clansfellow. (2) When people hunted game they usually went out in parties, and the kill was shared among
[317] them. (3) Digging earth means a journey of anything up to 16 miles round the edge of the forest and into country where nowadays there are strangers, so people find it both safer and more convenient to go in parties, for though they are in no danger of being attacked, their unconquerable shyness demands numbers to give
[241] confidence. (4) In a family or clan group, though each individual has his own shamba, he will expect both to help and to be helped by the other members.

[276] Together with the spirit of co-operation is the rule of joint consumption. We have already seen how meat is shared according to definite rules ; and among the Dorobo certain other things which are hard to come by must also be shared. The chief of these is tobacco, of which when a man has acquired even a small supply, he is supposed to give some to his father, to his wife's

6:Huntingford E-5 (1938-1939) 1953 FL6 Dorobo FL6

they have been stock-owners for too short a time, and on too small a scale to have formulated or developed any cattle customs of their own; they do not think (like the Nandi) in terms of cattle; and their main efforts are at present concentrated on trying to acquire cattle. For the last, three ways are open to them, all slow and laborious: bride-payment, gift exchange, and purchase.

Bride-payment. A Dorobo whose daughter is married to a Nandi receives for her the number of stock that a Nandi would give for a girl of his own tribe, i. e. 1 cow and 1 ox or bull, together with a variable number of goats; and when a Dorobo marries a Nandi woman he has to pay at the same rate. Arap Keter acquired his cattle from the marriages of his three sisters: the eldest, Kapotikuany, was married while his father was still alive, and on the old man's death he inherited the cattle paid for her; the other two, Cesum and Taprandic were married after their father's death, and the cattle for them (amounting in the case of Taprandic to 1 bull, 1 cow, and 5 goats) was paid to Arap Keter.

Gift exchange. Nandi from time to time make friends with Dorobo, chiefly for the purpose of getting honey. The first move after two men have come to regard each other as friends, *coruet*, is for the Dorobo to give the Nandi some honey, without expectation of any immediate return. After a time, the Nandi gives the Dorobo a goat, and thus the way is prepared for the handing over of cattle. Arap Minin became the friend of a Nandi at Ollesos called Kapkile, and eventually got from him an ox in exchange for a fur cloak; and on another occasion he got an ox in exchange for seven goats which he bought with his wages for working on a farm. Arap Korucu in his youth hunted at Kapiyet in Nandi, and shot *tisiet* monkeys, from which he made fur cloaks which he exchanged for cattle. To-day he has five head of cattle which are herded for him by a Nandi named Kipkorir arap Serem on Farm 1479: the Nandi looks after them in return for the use of their milk, Arap Korucu being given a small amount of it. This process of acquiring cattle is, of course, a form of purchase, but it is purchase under the peculiar conditions of forming a friendship by exchange of gifts first. The Nandi do not readily part with their cattle, and it is therefore necessary to lead up to the final stage, as the Dorobo regard it, by the preparatory exchange of other things. And as a method of acquiring cattle it is limited by the fact that the Nandi seem willing to exchange only male stock in this way, so that for female stock the Dorobo have to rely on bride-payment.

Purchase. The Nandi do not sell cattle to the Dorobo except as just described, that is, in the form of bride-payment or by exchange. But they will sell goats for cash. The Dorobo do not seem to care about sheep, for in 1939 none possessed any.

At the time of their move in 1937 the Dorobo were credited officially with a large number of cattle, some 2000 head in fact. But in 1939 the actual numbers that I saw and counted (and I have reason to believe that these were practically all they had) were very much smaller. The following list, while it may not be perhaps completely accurate, gives a truer idea of the real numbers. It will be noticed that there were few goats; some were undoubtedly

and by personal ability, and therefore to some extent by their geographical setting. They have no iron ore, no metallurgic knowledge, and so all ironwork is imported from the Nandi. Tobacco, which they like, is not grown as yet, and this too must be obtained from the Nandi. There is a regular exchange of honey, skins, and baskets, for arrowheads, knives, tobacco, seeds, pottery, etc., and a scale of exchange values has come into existence:

1 arrow head is given for a gourd of honey.
1 bundle of tobacco is given for a bag of honey.
1 large pot is given for a large bushbuck skin.
1 small pot is given for a duiker skin.
2 basketfuls of seed for one basket.[1]

Sometimes personal services are given, e.g. a day's weeding in the smith's garden for two knives.

Cattle are obtained from the Nandi, to a limited extent, by a system of gift exchange for furs. The Nandi make friends with the Dorobo chiefly for the purpose of getting honey, and the Dorobo will give some to his Nandi friend without expectation of an immediate return. Presently the Nandi gives the Dorobo a goat, and this exchange of gifts paves the way for further and more important transactions: eventually the Dorobo offers his friend a fur cloak for an ox, as e.g. my friend Arap Miniŋ acquired one from a Nandi called Kapkile at Ollesos; he also got another in exchange for 7 goats, which he bought out of his wages for working on a farm.

C. Techniques

1. Hunting

The dry weather, *owainonik*, is the shooting season, and the wet weather, *imot*, is the time for trapping. The weapon is the bow and arrow (spears are not used by the Kapchepkendi Dorobo), and the hunters use dogs.

In wet weather buck are caught in traps. In the dry season, wild pig of various kinds[2] were

[1] A honey-bag is about 12 ins. deep, and 8 ins. wide; it contains about twice as much honey as a gourd. A basket (kerepet) is about 6 ins. deep and 6½ ins. wide at the top.

[2] *Tumda*, the wart-hog (Phacochoerus aethiopicus); and *Torset*, the giant hog or bush-pig (Hylochoerus Meinertzhageni).

shares the *imbaret*, each house having its own strip, the whole being surrounded by a thorn fence which all help to make. Each is therefore a family or clan *imbaret*, and the group is an independent labour unit. 241 423 [351] [614]

The grain crops are stored either in granaries of Nandi type, or else in the loft (*tapot*) of the hut; but as most of the crop is eaten before or soon after it is reaped, and as the yields are not large owing to the small areas planted, storage problems are not yet acute. Further supplies of food are got (1) by purchase or exchange; (2) by begging 251 261 [937] [735]

[P. 197, B]

one down each side of the nose, and one down the centre of each cheek. 789 [726] [823]

Now it seems that a particular material is not always essential, i.e. for a homicide either a goat or a sheep may be killed to get the *eiyat*, and a sick man may be anointed either with goat's fat or with butter (though it must be a she-goat). An alternative is thus sometimes just as effective. But an essential feature is that the remedy must be something that is not easy to obtain; till quite recently, few Dorobo had any goats, sheep, or cattle from which they could get the necessary fat, *eiyat*, or butter, and even now many still lack them; nor does anybody keep a permanent stock of white earth in his hut. The whole procedure is an act of faith as much as anything else, and entails a possibly laborious search for the necessary material. There is also an economic implication, for when people have no stock they must buy the animals they need, so that into what might seem to be a purely ritual transaction, enters an element of business. 789 825 [231] 437

/233 cont./ As there,[1] the tanned
294 412 283 hides are sewed into articles of clothing with an awl (maramaog)
and a thread twisted out of animal tendons (asug). If a number of
439 hides for which, at the moment, one has no need for one's own
• 437 use has piled up, a few old men with women and children, laden
with skins and also steppe salt, set out for a neighboring area. Where
the distance between this and the Wandorobo camp is such that it
permits frequent trade, these caravans appear at the regularly held
markets. If, however, they are able to come only rarely, they
[805] peddle their wares, inasmuch as, out of ignorance of time reckoning,
they do not wait for the market days. They readily find customers,
since both articles are very much in demand. The agriculturalist
principally dependent on a vegetable diet always needs salt, but he
can only rarely extract it himself, since as a rule the arable soil
contains no salt or such not in sufficient quantities. The need for
hides /234/ is also often greater than the local production, even
today when fabrics have largely replaced the leather clothing. After
protracted haggling, an agreement is finally reached, and the
Wandorobo, satisfied, set out for home with the bartered vegetables.
If the hunting was sometimes particularly lucrative or if an elephant
or rhinoceros was killed, part of the meat would also be sold to the
always meat-hungry agriculturalists. Many of the latter, for example,
the Wataita and Wakamba, also buy the meat of predatory animals
from the Wandorobo, others disdain it altogether, and therefore, in
trading, they test each piece for smell and taste.

231 Old men, who only now and then in the evening lie in wait for
[887] game at a watering place, devote themselves outside the camp
especially to the checking and supervision of the beehives (Fig. 82),
a large number of which hang within an hour's range. These are
wooden tubes 120 centimeters long and /Fig. 82 appears here/ 30
centimeters thick, with an interior breadth of about 25 centimetem.
231 322 412 They are made by hollowing out a correspondingly long piece of tree
trunk, a very arduous task because the tools are so primitive. After
the trunk, through hewing with an ax, appears circular in cross-sec-
tion and tapered at both ends, it is smoothed on the outside with a
knife (pandyug). Two instruments are used for the hollowing out

1, [i.e., among the Masai--Analyst]

6:Huntingford E-5 (1938-1939) 1953 FL6 Dorobo FL6

224 476 In a settlement or clearing inhabited by several people, meat would be shared in a definite way:

I	Or	II	Or	III
A a man		A a man		A a man
B his father		B his brother		B a clansman
C his brother		C a clansman		C a clansman

A supplies B first, then C if C has no food; but before anybody else is given meat, A must give some to his father or father-in-law if they are within reach. Vegetable food, being accessible to all, is not shared.

462 There is a clear division of essential work between the sexes. Everything connected with hunting, bees, and weapons is done by men; women do the domestic work and other things of that nature. The more important normal occupations are divided thus:

Men:	Women:
1. Making fire.	Building houses.
2. Hunting.	Collecting vegetable food.
3. Trapping.	Getting water and firewood.
4. Putting meat on to cook.	Looking after meat cooking.
5. Making honey-barrels.	Collecting other foods.
6. Collecting honey.	Milking (if cattle are owned).
7. Making weapons.	Making baskets.
8. Exchange with the Nandi.	Preparing skins.
9. Getting coloured earth.	Making clothes, etc.
10. Cutting wood for uses other than firewood and building.	Care of the children.
11. Making fences.	Sweeping huts, etc.
12. Preliminary heavy work in the shamba [8].	Cultivation — all stages.

[857] Children of both sexes help in weeding and herding livestock; girls help with the housework and milking cows; boys milk till they are circumcised.

In the list above, the sex-division is followed strictly with regard to the first nine items of men's work; in the last three there is a certain amount of overlapping. Of women's work, basket-making, the preparation of skins, and making clothes are strictly confined to women, but the essential household work of preparing and cooking food, sweeping, and cultivation is often done by men, especially when they live alone in the state of monosis; such [438] men get baskets and suchlike from women in exchange for meat and food. House-building, including cutting and carrying the wood and roof-material, is all done by women, unless a man is living alone, or has to build a new hut at a time when his wife is for some reason away; Arap Minin, for instance, had to build a new hut when his wife was ill, and in consequence had to do

[8] Swahili for a piece of cultivated ground, and widely used by Europeans.

1:Huntingford E-4, 5 (1938-1939) 1953 FL6 Dorobo FL6

other scavengers. Nowadays, all hunting activities are carried on illegally with the risk of being punished if caught by the police.

Weapons are the bow and poisoned arrows carried in a quiver. Knives are used to skin game and to make springes. Spears have never been used. The Dorobo used to have hunting dogs, but in the North Tindiret Forest the breed seems to have died out, though it existed in 1927. They have two kinds of trap: (i) The pit trap, *ngwet*, formerly used for buffalo, consisting of a pit 8 ft. long, 3 ft. wide, and 6 ft. deep, with wooden spikes set in the bottom. (ii) The springe or snare, *porowet*, which consists, briefly, of a springy stick bent over, with a noose attached to it connected with a platform: the arrangement is such that when an animal treads on the platform its head enters the noose, and the pressure on the platform releases the springy stick, which flies up, tightening the noose, and holding the animal suspended. Such traps can be made in less than ten minutes. This type is used chiefly to catch antelopes, but leopards have been caught in them. Cross-bar traps with a drop-spear were not used by the Kipkurerek Dorobo.

The only hunting taboo recorded is that the night before he goes out hunting a man must abstain from sexual intercourse. This does not apply to the setting of traps.

As regards land rights, the forest was divided into districts, *koret*, pl. *korosuek*, and in his district each man had an hereditary block of land in which he hunted, set traps, kept his honey-barrels, and collected wild food. Occupation rights were recognized by public opinion, and trespass on a man's forest area, i.e., deliberate entry in order to start hunting without permission or the promise of a piece of meat, might result in the trespasser's death at the hands of the owner, who would then have to pay compensation for homicide. Theft of game from a trap is said never to have occurred, not only because the thief might be killed, but because his belly would swell to a great size and he would die after eating meat stolen from a trap.

Bees

Honey is to the Dorobo what milk is to the Nandi: it is "sacred," and its supply must be protected by the observance of taboos. Fruit and blood must not be eaten on the same day as honey (though meat may be eaten); when a comb is emptied, it must be carefully hidden in the undergrowth; and after eating honey a Dorobo cleans his hands in earth, not (like the Nandi) by wiping them with leaves.

The Dorobo recognize four varieties of bee: *sekemik*, the honey-producing kind; *imeiik*, solitary bees which live in trees; *kosomek*, earth bees, which live in the ground; and *kiptulonik*, mason bees, which live in cells made of earth and particles of stone cemented together by their own saliva. The Dorobo divide the honey-bees, *sekemik*, into three kinds: the queen, *kamet ap sekemik*, "the mother of the bees": the workers, called simply *sekemik*, considered to be males, which make honey by eating the "sap" (*pek*) of flowers and then vomiting it into the empty honey-combs; and the drones, *kapurenik*, considered to be idle females which do nothing useful.

Hives or honey-barrels (*pasanet*) are made either of slats of wood tied together, with circular wooden end-pieces; or of the two halves of a piece of log split longitudinally and tied together. They are set in trees, and when a new hive is put up, the owner calls the bees, in a high-pitched tone, to come and occupy it: "Bees, bees, from all the country, come here now, and pour in honey, pour in honey." Bees are said to recognize their owners by their body-smell, and do not sting them when taking honey. Certainly taking honey does not appear to be a painful or dangerous process to the Dorobo owner. Theft of honey from a barrel is considered very low, and a man might kill a thief, though he would have to pay compensation for homicide.

Honey is an important article in Dorobo economy: it is eaten as food, made into an intoxicant, used for ritual purification, and it forms an article of commerce.

1: Huntingford E-4, 5 (1938-1939) 1953 FL6 Dorobo FL6

AGRICULTURE

The Dorobo began to cultivate in a small way about 30 years ago (or even a little earlier) and at first they grew only eleusine. Though their inclinations were to become cattle-owners, conditions were unfavourable to the development of cattle-breeding as a primary activity and they have been forced to make agriculture a serious business; for the methods, implements, and even the seed used in this, they have been indebted to the Nandi.

Land

Those who live in A and B domicile categories (with whom alone we are concerned here) cultivate small plots in the open land which surrounds the forest. They have no rights of tenure, except the temporary ones acquired, according to Kenya law, if they live there as squatters under the Resident Native Labourers Ordinance. Their plots, *imbaret*, pl. *imbarenik*, range in size from one acre divided into four individual holdings, to half an acre divided into four holdings; in other cases, plots of a quarter to one-fifth of an acre worked by one person. All plots are fenced, and sometimes a living-hut is built inside the fenced area; occasionally it was found that elderly Dorobo were allowed by Nandi squatters to have a little piece of their cultivated land to work.

European farmers in the district, with whom the Dorobo land question was discussed, seemed not unwilling to let the Dorobo live unmolested on their land provided they gave no trouble; but the government authorities thought otherwise, and the position of a Dorobo who did not choose to become a squatter in order to live on what he considered his own land was thus precarious.

Cultivation Methods and Crops

Two main crops are grown, eleusine, *paiek*, and maize, *ipandek*. Millet had not been grown by 1940, though they bought it from the Nandi. Sweet potatoes, *ropoonik*, are sometimes grown in very limited quantities. Implements are the heart-shaped hoe and the panga or cutlass, both obtained from the Nandi. They have also small axes, *ndolut*, and knives, *roluet* or *cambolust*.

The growing of crops is regulated by the dry and wet seasons, *muainonik*, from October to March, and *iwotet*, from April to September. The land is prepared between January and April, and planted in April or May according to the rain. Cultivation follows the Nandi method, with paring and burning of new land. The seed of eleusine and maize is bought from the Nandi, usually from squatters living nearby. Maize and eleusine are planted together in the same plot, though potatoes are generally grown separately. Eleusine is reaped in the Nandi manner by cutting off the heads; maize is picked by hand. Granaries of Nandi type are sometimes made, but are seldom needed, as the yields are so small that the loft of a hut can generally hold all that is not eaten on the field (as is often the case with maize). Cereals are roughly ground on slabs of granite in the Nandi manner.

Food

Food in the old days consisted mainly of meat supplemented by honey, wild vegetables, and grain bought by exchange from the Nandi. The food supply is now based on their own agricultural produce, supplemented by milk when they have any, and by certain other foods when they can be got. Meat is still obtained by trapping, though seldom by hunting; it includes the flesh of antelopes, monkeys, pigs, and leopards. Honey is got, as already described, from honey-barrels. Wild food, collected in the forest, includes fruit of the *momoniat* (*rubus rigidus*), *lemeiyuet* (*ximenia americana*), and *sasuriet* (*musa ensete*, wild banana), the sap of the *sasuriet*, and leaves of nettle, *sinot*.

Intoxicating drink is of two kinds: the Dorobo honey-wine, *kipketinik* or *kumik ap lo*, made from honey, and fermented with the long seed-pods of the "sausage

1:Huntingford E-4, 5 (1938-1939) 1953 FL6 Dorobo FL6

[262] [273] true," *rotinust* (*higelia athiopica*); and *maiyek*, eleusine beer, made, though seldom, in the Nandi way. They also drink a mixture of honey and water called *lokomek*.

Trade and Exchange

● 439 The inability of the Dorobo to produce many of the things they need has led to the development of a system of exchange with the Nandi, who till recently were [648] almost the only people with whom they had dealings. Relations between Dorobo and Nandi have been such that, though maintaining their complete independence, [177] the Dorobo have not only obtained goods by trade, but have acquired and assimilated much Nandi culture, including language, clan-names, agriculture, and many material features like dress and ornaments. Their relations are in general friendly, [582] for the Nandi like honey and furs which they get most easily from the Dorobo, and there has been an increasing number of marriages of Dorobo men with Nandi women, as well as of Dorobo women with Nandi men. But neither side takes liberties with [181] the other: the Dorobo fear the physical superiority of the Nandi, and the Nandi [186] fear the close-to-nature life of the Dorobo, as well as a certain mystical force as rain-makers which they attribute to them.

From the Nandi the Dorobo get objects of iron, pottery, beads, tobacco, cattle (see below, p. 61), and the seed of cereals for planting. The Nandi get skins and [437] honey from the Dorobo. There are no special places for trade, but the Dorobo go to the nearest smith or potter or other person who can supply them, and make their bargains. This means a journey into the Nandi Land Unit, but other things can be got from the nearest friendly Nandi. The exchange values in 1939 were:

[935]
1 axe for 1 bagful of honey;
1 bundle of tobacco (about 1 lb.) for 1 bagful of honey;
1 arrowhead for 1 gourd full of honey;
1s. worth of trade beads for a gourd full of honey;
1 knife for a day's weeding in the smith's garden;
1 large earthenware pot for 1 large prepared buck skin (usually bush-buck)
1 small earthenware pot for 1 small prepared buck skin (usually duiker);
2 baskets of seed for planting for 1 new basket.

[415] The bag, *motoket*, is made of skin and measures about 8 ins. by 7 ins.; the gourd is about 10 ins. long; the large pot is about 20 ins. high, the small pot about 10 ins. high; and the basket is about 6 ins. deep and 6 ins. wide.

Cattle

231 [177] [648] The Dorobo interest in cattle is probably due to their long contact with the Nandi; but though they desire cattle, they have not the land for them. Yet they have speculated about cattle inheritance, and by 1939 had worked out theoretical rules which they had scarcely had opportunities of testing. When they were evicted from the forest in 1937 they were officially credited with about 2,000 head of cattle; but no census of either people or stock appears to have been made in preparation for this event, and most of these cattle did not belong to real Dorobo. In 1938–9 the numbers of stock which I counted during the compilation of my census were:

	Cattle	Goats	Dogs
Koret of Kipkorom ..	25	15	4
Koret of Sosoiyo ..	54	19	3
Koret of Kelpai	11	0	0
	90	34	7

[171] Methods of cattle-management are based on those of the Nandi.

l: Huntingford E-4, 5 (1938-1939) 1953 FL6 Dorobo FL6

cide, adultery, and assault. In the first category, incest is punished under the authority of the clan council: the man is beaten, his hut burnt, his honey-barrels destroyed; the woman also is beaten. Witches might be killed under authority of the *koret* council. In cases of persistent disobedience to the council, the elders could call upon two or three men to force the offender, by moral and physical persuasion, to mend his ways. Of offences in the second category, trespass has already been mentioned (p. 58). Theft, when not dealt with summarily, can be brought to the *koret* council, which can order payment of compensation. A man accused of stealing food may say, "If I am a thief, may this grass eat me," and place a blade of grass between his teeth. Adultery might be punished by the injured husband, who, if he killed the offender, had to pay blood-cattle. If a man incapacitates another by assaulting him, he must feed him till he recovers. Homicide of a Dorobo of another clan, though not involving primary sanctions, was a serious offence because it meant that the murderer had to get cattle in order to pay compensation. The usual number was nine head of cattle, though when the murderer was a very poor man living alone the number might be reduced. The kind of cattle (male or female) did not matter. The murderer had to provide as many as he could, from his own herd if he had one, or by exchange from the Nandi, or by any other means, including theft. The deficiency had to be made up by his fellow-clansmen.

Summary

The Dorobo horde consists of a loosely integrated group of districts held together partly by the feeling that they are all Dorobo, but much more by the clan ties which cut across the district boundaries. The clan is therefore one of the chief institutions in the life of the Dorobo.

MAIN CULTURAL FEATURES

CRAFTS

Housing

(*a*) Forest type: the *koconget*, in use as late as 1927, was a framework of sticks bent over to form an oblong, dome-shaped structure, covered on the outside with banana leaves and leaves of trees; height, 6 ft.; length, 11 ft.; width, 7 ft. (*b*) New types: the *keriet* has a circular wall about 5 ft. high plastered with mud, and an almost flat thatched roof supported by a centre post; the *kot* is a hut of ordinary Nandi type, the walls of which are occasionally left unplastered.

Settlements in the forest, consisting of three or four *koconget* huts, were situated in clearings just big enough to hold the huts, and were approached by concealed paths which branched in a bewildering manner that made it impossible to find them without a guide. Settlements outside the forest are arranged in small groups usually close to the cultivated land.

Dress and Ornaments

Clothing is made largely from the skins of wild animals, and the forms are mainly copied from those of the Nandi, as are most of the ornaments, which include, among other things, iron wire armlets and leglets, necklaces, and married women's ear-rings (*taok*). The ear-lobes are pierced and elongated (sometimes getting torn in the forest), and a small hole is bored in the top of the ear. Some but not all remove the two lower middle incisors. Hair is allowed to grow to a length of about 2 ins., when it is sometimes covered with a bladder cap, and sometimes dressed with red earth and fat. Occasionally a man has his hair done in pigtails like the Nandi.

Tools and Weapons

Axes and knives are obtained from Nandi smiths, the Dorobo making the wooden handles. Needles are made from old nails and bits of wire which the Dorobo

1:Huntingford E-4, 5 (1938-1939) 1953 FL6 Dorobo FL6

find lying about on the farms. The only weapon is the bow, *kuyeyda*, which the Dorobo make themselves from the *kwiet* tree (*Acokanthera* sp.); it is about 5 ft. long, and the bowstring, *iset*, is made from gut of the giant pig, *tumda*. Arrow-shafts are made from the *koromandet* and *masaita* trees, or from bamboo, *sosiyet*; arrow-heads are bought from the Nandi, and are of the Nandi patterns. Arrows are carried in quivers made of hide. Arrow poison is made from the *kelket* bush (*Acocanthera Schimperi*).

Baskets

Making baskets, *kevepet*, is a common occupation of Dorobo women. They are made from fibre of the *phoenix reclinata* palm, *sosiet*, and sewn with bast made from a plant called *taparuriet*. The technique is a spiral foundation with a flat then gradually ascending coil, of the simple over-sewn type and bee-skep variety, the stitches being spaced out and not close together.

Miscellaneous

Salt used to be made from the ashes of the plant *tepengwet* (*aemilia integrifolia*). Red and white earth is found near Timboroa on the east of the Dorobo country, and men go in parties of four or five to dig it, carrying home the earth in large leather bags, mainly in order to sell it to the Nandi who, in 1930, gave them 2s. a bag. Red earth, *erokoit*, is mixed with fat or simsim oil for rubbing on the hair; white earth, *eworiot*, has magico-religious uses. For carrying a number of small objects a carrying-net called *lekuelet* is used; it is made of a pair of oval rims 3 ft. 6 in. long with pieces of liana stretched across them, somewhat resembling a pair of handleless tennis rackets. These are sometimes used by the Nandi.

Ritual and Beliefs

Religion

Asista, the sun, is recognized as a being that can supply or withhold the needs of people: *Asis, ipiiyec panyek*, "*Asis*, fill us with meat," is a common prayer. Some say that *Arawa* the moon is his sister, others that she is his mother. Besides *Asis*, it is believed that there is a being called *Ilet*, the thunder, who produces rain, and "the rainbow is his arm which draws up water for him." The Dorobo also believe in spirits, good and bad, both of which are called *cesowiinik*, a word which includes the *oiik* (ancestral spirits) and *masambaanik* (evil spirits) of the Nandi. The ancestral spirits have the same significance and functions as those of the Nandi, and though they punish the living for doing evil, they are otherwise friendly and visit the living, travelling in the bodies of snakes, both to see their people and to get food in the form of *lokumek* (honey and water); spirit-snakes should not be killed.

Divination

The Dorobo appear to have no diviners of their own, and when they have recourse to divination, as in cases of illness or witchcraft, they go to Nandi diviners of the type called *sakeywot*, by whom they are charged a small fee. The people called *orkoiyot* (pl. *orkoiik*) among the Dorobo are no more than leeches or physicians who prepare healing medicines from trees and plants. Although the Dorobo have a reputation among other tribes as powerful rain-makers, they themselves say that they have no rain-makers, which is probably true.

Death and Burial

Very old men and women are buried in narrow holes about 5 ft. deep in which the bodies are laid full length wearing their clothes; one year after an old man's death his children plant a branch of *mukuyeet* (*dracaena* sp.) on his grave and let it grow. Other people are laid out for the hyenas, both sexes on the right side with

1:Huntingford K-4, 5 (1938-1939) 1953 FLA Dorobo FLA

THE DOROBO OF KIDOI (KERUTA)

History

101 The group described by Lambert as living at Kaditu on top of the escarpment, on the edge of the Forest Reserve 10 miles north of Lumbwa, is first classed as Kidoi in *Anthropos* 1951.[1] It was seen by Thomson in 1883 at the place known to the Swahili as Mkondoi (" place of bamboos ") where, he says, a Dorobo village was established for selling food, bought from the Kikuyu to the Masai and the traders.[2] This group is part of the Kikuyu Dorobo who occupied the land before the Kikuyu came. The process by which the Dorobo lost completely lost their land by 1902 when Tribal reserves through is summed up by the Kenya Land Commission as one " partly of alliance and partnership and partly of adoption and absorption, partly of payment, and largely of force and chicanery."[3]

[839]

648

Organization

621 There are no chiefs, control being in the hands of a council of elders, with a leading elder called Mwenkindet, as among the Kipkoreek. Marriage is patrilocal, and descent patrilineal. Polygyny is permitted. Boys are circumcised, and girls are subjected to clitoridectomy. There appears to be some sort of age-set system, but Lambert's statement is not very clear on this point.

There are said to be nine clans, with Nandi-looking names beginning with the prefix *kap-* (which does not imply territoriality, but simply means " group of "). These clans are sometimes referred to by Masai clan names, or even by Kikuyu clan names. The word for clan is *ol-ghotet*, derived from the Masai *ol-gotet*, " clan," and not, as Lambert suggests, from *ol-gotin*, which means not " clan," but " side path."

614

Religion

NK 969 113 A so-called supreme being called *Torrorit*[4] is recognized, and the elements describing ancestral spirits as " active members " of a lineage implies the existence of an ancestor cult.

FLA Dorobo FLA

covered with a strip of soft hide—often that of reedbuck or impala—worked to a state of pliability resembling that of chamois leather. The barb is never coated with poison under any circumstances.

A small supply of *kombi* poison (*ngwana*) is sometimes carried in the keel of the quiver. This poison is a black, sticky mass made by boiling the leaves of a certain tree and is manufactured exclusively by the Wakamba. The Dorobo know nothing about it, hold it in considerable awe, and have never attempted to make poison of their own.[1]

In the quiver is also carried a fire-stick (*Ol-kiriakyat*) and a fire-block (*ensemia*). The Dorobo are experts at making fire and scorn to use matches. A small flat spoon (*kwaiiwandet*) for smearing poison on the arrow-heads is also carried—this spoon is made from the same wood as the bow; and a small knife for smoothing and rounding the arrow-shafts. This knife is called *ensata nitiit*.[2] A wooden tube about twelve to eighteen inches long and a quarter of an inch in diameter, not unlike a pea-shooter, will always be found in a Dorobo quiver. This tube, called *endaire*, is used for drinking from pools which are shallow or which have a dirty, scummy surface. (It is a point of honour with every Dorobo and an unwritten bush law that a man should not stir up the mud in any water at which he drinks.) The *endaire* is also used to induce, by blowing through it, a blast or clouds of smoke from lighted grass put into a hive to drive the bees away from the honey.

A Dorobo quiver, as we have seen, contains a large number of objects essential to the bush life that the Dorobo leads. It is scarcely to be wondered at, therefore, that it is next to impossible to purchase a furnished one. A Dorobo once told me (I am sure he meant it) that he would not exchange his quiver and its contents for five cows. The price habitually paid to the parents of a girl taken in marriage is from two to five arrows, and a demand on the parents' part for a full quiver would be regarded as extortionate.

The Dorobo may be seen sometimes with a small axe which

[1] That is, arrow poison. The Dorobo are reputed to have a powerful poison they mix with snuff. When inhaled, it is stated to have a fatal result. I have been unable to obtain a specimen of this poison and doubt its existence.

[2] Literally, "Small knife."

3:Huntingford E-5 (1921-1928)1929 FLA Dorobo FLA

II.—Mode of Subsistence.

Houses.

342 [361] The Dorobo live in little shelters or huts (*kenkenyot*, pl. *kenkenyotik*; N. *kwiq*) built in small clearings in the forest; they are made of a framework of sticks stuck in the ground, and bent over, forming a domed roof; the whole is covered on the outside with leaves of trees and banana leaves, which are insufficient, in spite of the addition of an ox-hide on the top, to keep the hut dry inside when it rains. The upright sticks are strengthened by others tied across them with tree-rope. The huts are oblong, with rounded ends, and are of the following average dimensions:—Height, 5 ft. 10 ins.; width, 7 ft. 6 ins.; length, 11 ft. They are occupied for two or three months, after which they become ruinous and "full of fleas," when the [590] family moves to a fresh site. Two to four people live in one hut. One group of huts we saw contained two huts, and had contained a third which had been pulled down. The huts are divided into two parts, the *sleeping-place* (*ilkito*, N.) and the [353] *fire-place*, which are separated by two or three poles laid across the floor of the hut, [513] on one side of which are laid ox-hides (*muteik*; N. *muiwik*), upon which the occupants eat and sleep; at night they cover themselves with skins. In the other half of the hut is the door (*kurbat*, N.), about 2 ft. high. Some huts have two doors, opposite [354] each other. Between the door and the *sleeping-place* is the hearth (*mik*, N.), consisting of two or three smallish stones set on the floor. A loft (*saiwat*, N.) is sometimes made in this part of the hut, extending across the whole [illegible] beginning of the sleeping-place. The loft is about 3 ft. 6 ins. above the floor, and [251] is made of thin sticks supported on thicker cross-sticks, and tied together with [378] tree-rope. Upon it are kept firewood and *olmisiu* grain (Text-figs. 30-32). The [412] only household utensils are a small broom (*sellutiet*) about 14 ins. long, made of [415] a hook-bark's tail fastened to a thin wooden handle, for sweeping the floor; "water jars" (*soiget*) made of a hollowed piece of bamboo about 2½ ins. wide and 2 ft. 6 ins. long; a grindstone (*lolto*, N.) made of granite, for sharpening knives, and for grinding *olmisiu* grain. Gourds and earthenware pots are obtained from the [439] Nandi; the Dorobo have no stools. Fire is produced by means of fire-sticks (*pilmet*; 372 N. *pilmet*) (Text-figs. 11a, 11b). A thin stick of the *olmorut* tree (N.),[1] about 12 ins. long and ½ in. thick, is stood upright on a stick of *ondoi* (*nut*)[2] about 20 ins. long and 1 in. wide. The thin stick is called *pilmet*, the *ondoi* stick *tasumet*. The *pilmet* is held between the palms of the hands, and the hands are rapidly rubbed together, beginning at the top of the *pilmet* and working downwards (Pl. XXVI, Fig. 2). This is repeated until fire is obtained; the *pilmet* drills a hole in the *tasumet*, and the heated wood-dust thus produced falls on to a knife-blade which is placed underneath. When sufficient heat is obtained it is laid on a small bundle of *tinder* (*soiget* (dry grass) or fibre of the *pesiwet*[3] tree), and blown till the tinder kindles.

[1] *Ficus* sp. [2] *Juniperus procera*. [3] *Dombeya* sp.

3:Huntingford E-5 (1921-1928)1929 FL6 Dorobo FL6

The women
prepare food and wait upon the men, themselves eating when the men have finished. 264
At the present day the Dorobo are taking to eating eleusine grain, which is crushed [462]
on grindstones (*lóito*, N.) and made into a sort of porridge; and milk, which they 251
obtain from Nandi, if there are any near them. Beer is made from honey, and 262
is called *kípketinik* (N.). Tobacco (*tomotet*, N.; or *chepkuchóiz*,[1] N.) is bought 273
from the Nandi, and is taken by men, and occasionally by women. It is either 276
chewed (*wit*, N.) or smoked in Kavirondo pipes (*sotbuik-ap-tomotet*, or *kwotinik*, N.), [434]
which are also obtained from the Nandi. The men carry tobacco in cylindrical
boxes called *kípsomoi* (N. *kípsot*) (Text-fig. 22), made from *sosiyot* (bamboo), [415]
with skin coverings for the ends, to which are attached thin leather thongs, by
which the box is slung round the neck.[2]

Agriculture and Stock.

Formerly the Dorobo possessed no stock, nor did they till the ground. During 231
the last quarter of a century or so a few of those living on the edge of the forest have 241
taken to cultivating small plantations (*imbwet*, N.), in which they grow eleusine 178
grain (*ulhuiyét*, or *paiot*; N. *pili*) only. A few possess, at the present day, one or
two cows; others have a few goats and sheep; no one has more than 8 to 10 head.
The only animals they possess in numbers are dogs.

Dress and Ornaments.

671
Warriors wear skin garments of dulker (*sapmwogo*,[3] N.) called *akwiet*; they wear
leg-bells attached to a leather band (*sapiitha*,[4] pl. *sapiitháinik*) on the ankles.
Nowadays some wear pieces of cotton-cloth (*angot*, N.) dyed brown.[5] Old men
wear bush-buck skins (*akwiet*) with the fur left on. Caps (*ingwenit*?) are worn, of
blue duiker skin with the fur left on, by old men, and of cotton-cloth by warriors.
Belts (*ontenit*?) of leather are worn by old men, and of beads by boys and warriors.
Necklaces of chains (*siriondo*, N.) or iron-wire (*aniegwit*, N.) are worn; also various [301]
kinds of iron ear-rings (*ndeimeriat*? and *kiwa-tinik* (Text-figs. 13-17); N. *kimá-*
tetiat) are worn by warriors and elders.

(ii) *Females.*—The dress of the women and girls is very similar to that of
Nandi women. They wear skirts (*ákeptinjuit*; N. *chepkunit*) and upper garments
(*kaldiet*, N.), both of tanned leather, with the fur removed, in the same manner as the
Nandi women. Their ornaments consist of iron-wire armlets and leglets (*mukwenhuk*
and *kwrik*, N.), and wire necklaces (*aniegwit*, pl. *aniegwáinik*, N.). Married women wear [301]

[1] Chepkuchóit means "smell" in Nandi.

[2] These are similar to the Nandi tobacco-boxes, from which indeed they are probably [111]
borrowed.

[3] As do the Nandi, from whom doubtless the custom spread to the Dorobo.

3:Huntingford E-5 (1921-1928)1929 FL6 Dorobo FL6

291
301 large discs of brass wire (*tost*, pl. *tuk*), which are hung from the ears by leather straps (*muilto*; N. *muito*), to which are frequently fastened one or two cowries (*sekerick*; N. *sekerek*) (Text-fig. 18). These ear-rings are, as among the Nandi, the sign of marriage. Girls wear skins (*aluriet*) or cloth (*anget*). They have armlets (*kurik*, N.) and leglets (*udapalwet*; N. *tapalwet*) of iron-wire, and necklaces of wire or beads (*asingait*). The edges of skin garments, both of men and women, are generally trimmed and stitched.

Mutilations of the Body.

304 (a) *Ears.*—In both sexes a small hole (*engeberit*; Kony *ingeberit*) is bored in the top of the ear. This among the Nandi is the tribal mark, and it seems to be so among the Dorôbo. Both sexes also pierce the lobes of the ears, and elongate them by inserting cylindrical blocks of wood (*kutik ap iitik*, N.), as among the Nandi.
[301] Ear-rings are hung from the lobes, which in the case of men are often broken by being caught by branches in the forest.

(b) *Teeth.*—Some Dorôbo remove the two middle incisors of the lower jaw, like the Nandi and other tribes; others do not. This is done, they say, "*si ko-kororon-it piik*" (in order that people may become beautiful).

(c) *Sexual Organs.*—Circumcision and clitoridectomy are practised. (*See* V, "Circumcision.")

302 Men wear their hair moderately long; they put oil and red clay (*ngarset*, N.) on the hair, which sometimes becomes matted, as seen often on Nandi, particularly women. The head is shaved periodically. Boys put red clay and oil on to the shaved head. Both old men and senior warriors wear beards and moustaches, though to no greater extent than the Nandi. In some old men the beard is seen trimmed and pointed. Girls and women shave their heads periodically, and put oil on the shaved heads.

Paint.

Warriors paint their legs with red and white clay, as do the Nandi; they also put red clay on their heads.

Arts and Crafts.

325 The Dorôbo have few crafts of their own. They have no knowledge of metal-
[439] lurgy, and there are no smiths; all their ironwork is obtained from the Nandi.

(c) Weapons of Chase and War.

411 These consist of bows (*bogulgulo*), arrows (*ldeiek*, *kipurtuik*, *kipukdpuuik*, N.; and *ndwantit*); spears (*almurundoit* or *murundoit*?); swords (*susulto*; or *ratuet*, N.); shields (*ledget*, N.); and knives (*skambulwat*, N.). Spears, swords, and shields are obtained from the Nandi.

3:Huntingford E-5 (1921-1928)1929 FL6 Dorobo FL6

411 *Bows.*—These are made from the kuriot (N.) tree, and average 5 ft. 1 in. in length. The string (*inet*, N.), which is made from the entrails of the giant pig [237] (*tumda*, N.), is tied to the bow (Text-fig. 4).

Arrows.—The iron heads (*kipchápet*) are bought from the Nandi, and are usually [439] of the Nandi shapes called chepilofigiot (Text-fig. 5) and kipchapet (Text-fig. 6) (H.N. Figs. 33, 34). They are from 2½ ins. to 4 ins. long. They are always tanged, and are inserted in a slit made in the arrow-shaft (Text-fig. 9) and bound with fibre or skin binding (*simolto*). The shafts are made of the sosoiyat (bamboo), masaita, and koromandet trees, and are of an average length of 2 ft. There are three feathers (*kororik*, N.), which are split and trimmed, and fastened to the shaft by a spirally-bound cord (Text-fig. 8). The shaft immediately above the feathers is bound with skin *simolto*; the notch (*saita*) is shouldered, and bound over the shoulder with a skin *simolto*. The length of the feathers is 2 ins. to 2¾ ins. Arrows are kept in a quiver (Text-fig. 10) (*mootiet* N.; *mboilgit*) of leather, and about 2 ft. 3½ ins. long, with a leather cap and a sling for carrying it round the body. (For the position assumed by Dorobo for shooting with the bow, *see* H.N., Pl. VII.)

412 *Knives.*—The iron blades are bought from the Nandi. They vary in length from 9 ins. to 12 ins., and are about 1¼ ins. wide. The handles are about 5 ins. long, of wood, with spiral marks cut in them, and covered with skin, which is pressed into the marks so that they show through the skin. The knives are carried in leather sheaths (*shokit*, N.) which are attached to leather belts (*tapsienet*, N.) (Text-fig. 3).

(*b*) Leather.

281 Skins are dressed and trimmed, and furnish, besides articles of dress and bedding, quivers, sheaths and bags. The ordinary type of bag is called motok[illegible]
415 It is used for various purposes, including carrying honey; for honey-bags, the f[illegible] removed. Bags for carrying other things are made of antelope skin (e.g. *kips*[illegible] blue duiker) with the fur left on, and flaps to shut them, which are fastened by a [480] skin cord tied round the bag (Text-fig. 12). They are slung from the shoulders by a skin cord. Small bags are about 7 ins. by 6½ ins.; others are larger.

(*c*) Baskets (*kereyet*, pl. *kereyonik* (N.)).

285 [469] These are made by the women. They resemble Nandi baskets of the same name. The upright straws in the baskets are called taparik; the cross straws, sosik (N. = *Phœnix reclinata* palm). The bottoms are flat and are made of skin, which is sewn to the sides. Some have a handle of skin. The average depth of the baskets is 6 ins., width at top 6½ ins. (Text-fig. 21).

(*d*) Miscellaneous.

482 For carrying things in the forest, a contraption called lekwelet (N.) is used (Text-fig. 23). It consists of two oval objects somewhat like tennis-rackets fastened

3:Huntingford E-5 (1921-1928)1929 FL6 Dorobo FL6

together. The rim is made of a single stick bent in an oval and the ends bound together; across it are fastened pieces of tree-rope.[1] Grindstones (*litîto*, N.) have already been mentioned.

The Dorôbo have no knowledge of metallurgy, and they have no musical instruments, pottery, or, apparently, objects of ivory. Metal-work and pottery they buy from the Nandi.[2]

Trade and Commerce.

Trade is by barter. The Dorôbo give the Nandi baskets, dressed skins, and bows in exchange for ironwork, tobacco, pottery, beads, and other necessaries which they cannot produce themselves. There are no special market-places, but goods are taken to any place where there are Nandi, and there exchanged.

Land.

(i) *Tenure.*—The forest is divided by the elders into sections, and each family has its own section of forest. The boundaries between family holdings may be paths or rivers.

(ii) *Geographical Divisions.*—The Dorôbo divide their country into divisions called *koret*, pl. *korosuek* (N.). The chief divisions appear to be called Kipkorom, Sirua, Kimurienge, Sosoiyo (bamboo, N. *tekat*), and Mokopich. The majority of the present place-names are Nandi.

The points of the compass are called as follows:—North and South: Murot (N.). East: Ye-torur (N. *ulin-durur* = up). West: Ye-'rek-to (= where(-the-sun)-descends-thither).

III.—Government.

The Kámellio-Kápchepkendi Dorôbo have now no chief. The last to hold office was Parñgetuny[3] arap Ñgamñgam, who was chief at the time of the Nandi Punitive Expedition, 1905. He is still alive, though he no longer holds office. The chief was elected, and the office was not hereditary. The chief (*kiruogindet* (N.)=councillor) was chosen for "ñgelyepta kitio" ("tongue only" = sense, ability and position). The only form of Government that exists now is a council of elders (*kiruogat ap poiisiek*, N.), who meet and decide on matters which are brought to them. They seem to have little power of enforcing obedience to their decisions, though they claim

[1] This is described and illustrated, although it is a Nandi use, since H.N. does not mention it.

[2] On the use of horns, *see* V, "Miscellaneous." These can hardly be considered as instruments of music.

[3] N. = lion-killer.

5:Huntingford E-5 (1938-1939) 1954 FL6 Dorobo FL6

in material culture. The Nandi keep cattle, till the soil, make pottery, and work iron, none of which the Dorobo did; and they have passed on to the Dorobo a number of things which have now become an inseparable part of Dorobo culture without receiving much from the Dorobo in return. Although the Nandi have never lived in the forest, they occupied and grazed their cattle till 1906 on the open ground to the west and southwest of the forest — the original Nandi divisions of Kamelilo and Kapcepkendi — and so contact was inevitable. There has been no fusion of the Dorobo with the Nandi; the few intermarriages have not resulted in anything like even partial fusion, and Dorobo who have lived for years in Nandi, like Arap Ngamngam and his sons, are regarded as nothing but Dorobo. Although KRAPF said that the "Wamau people are Wandorobo whose duty it is to hunt elephants for the Masai" [3], there are no indications whatever that the Kipkurerek ever had any "duties" to perform for the Nandi, and the occasional employment of a Dorobo as circumcisor by Nandi or Masae does not constitute "subjection". The Dorobo and Nandi have in fact lived their own separate lives, though they now share a good many cultural features which have been voluntarily adopted by the Dorobo.

A good deal, in fact, of their existing culture has been adopted from the Nandi, and among these adopted features we may include the following:

1. Clan names and possibly the totem idea, though not the clan system.
2. The method of dividing the country into districts or parishes (the Nandi *koret* system), and the resulting *koret* council (which is the basis of Nandi government).
3. Some relationship terms.
4. The age-set system, and circumcision.
5. Certain features of material culture like dress, ornaments, the use of iron objects, pottery and tobacco, and a certain type of hut. It is these features which give the Dorobo a superficial but misleading resemblance to the Nandi.
6. Language and time-reckoning.

The existence of Nandi clan-names, relationship terms, and time-reckoning may be accounted for by the use of the Nandi language. Circumcision and age-sets are definitely an Hamitic feature, and obviously borrowed from the Nandi complete with names and intervals. But the clan system is so fundamental a part of Dorobo organization that it must have existed before contact was made with the Nandi.

From the Dorobo point of view, their reception of Nandi culture may be expressed thus: Certain elements forced on them by economic pressure, like agriculture and stock, lead to economic advantage, as of course does the voluntary adoption of iron weapons and tools. Female dress and ornaments adopted voluntarily lead to prestige, while clan names, relationship

[3] Vocabulary of the Enguțuk Eloikob (1854), p. 28. KRAPF seems to have been the first to suggest that the Dorobo were serfs of the Masae, a notion which I think is just as mistaken with regard to other Dorobo as it is to the Kipkurerek.

[Text Continues on P. 126--Analyst]

5:Huntingford E-5 (1938-1939) 1954 FL6 Dorobo FL6

terms and other intangible elements, because of their suitability, fitted into the existing culture pattern and were thus voluntarily adopted. The Nandi, not being bee-experts, none the less desire honey; not being hunters, they desire furs; the Dorobo being both bee-keepers and hunters can supply the Nandi with what they want, and in return get from the Nandi things which they cannot produce. The satisfaction of these desires has undoubtedly helped in the transmission of Nandi culture to the Dorobo, and it has also preserved the continuity of friendly relations between the two peoples.

When I first met the Dorobo in 1927 they were virtually as they had been in pre-European days: a purely hunting people with a basically non-Nandi organization heavily overlaid and modified by Nandi influence, yet distinct in outlook and way of life — so distinct in fact that having taken to agriculture and cattle simultaneously, they have not acquired the cattle complex of the pastoralist and retain the outlook of the hunter.

2. The Clan and its Place in Public Life

The life of the horde is controlled by two institutions: the clan and its council, and the *koret* council. The clan council may be described as a primary institution working within the framework of the *koret* organization. The Dorobo are not a "tribe" like the Nandi, and the clan-system does not strengthen tribal solidarity, but it does strengthen and maintain horde-unity by bringing together clansmen from the whole area to deal with clan affairs. The clan council deals with matters which concern members of the clan; the *koret* council is more political and less domestic, regulating the district as a whole irrespective of clan.

If behaviour and kinship are the basis of social life, the clan is the basis of horde-cohesion and government; and it is in regard to the importance attached to the clan that Dorobo social organization differs fundamentally from that of the Nandi. To the latter, the clan is in practice little more than a means of regulating marriage, and a traditional form of tribal division (though it has actually a deeper but less easily defined significance); but to the Dorobo the regulation of public life as a whole depends upon the clan, and its social importance is emphasized by the habit of living in clan settlements, by the clan councils, and by the stress laid on the group-aspect rather than on the totem-aspect of the clan. Moreover, clan-solidarity crosses the *koret* boundaries, and is the main factor that keeps the horde together under conditions which would render powerless any institution less strong.

The social aspect of the clan has been described in a previous paper [4], and this aspect need not therefore be touched upon here. People tend to live in clan settlements, and therefore the institution of a clan council is both natural and easily maintained. The clan council consists of all the old men of the clan, that is, the men of the age-sets senior to the age of the *murenik* who correspond to the fighting men of the Nandi; though in practice it has become customary for anyone who has been circumcised to attend the council

[4] Anthropos 46. 1951. pp. 38-41.

6:Huntingford E-5 (1938-1939) 1953 FL6 Dorobo FL6

805 [221] [224] [132] The Dorobo divide the year into two parts, *Muainonik*, the dry season, when they used to go hunting the bigger game with bow and arrow; and *Iuot*, the wet season, when they set traps. Each season covers roughly half the year, the rain beginning to tail off in September and getting less and less till January, and then starting to work up again in March, reaching its peak about May; so that *Muainonik* comprises our months of October to March, and *Iuot*, April to September. The Dorobo have twelve months, all but two having the same names as the Nandi months, but they do not synchronize [4]:

Dorobo names:	Nandi names:		
Kipiriruo	*Kipsundet*	October	
Kipsundet	*Kipsundet oiew*	November	
Kipsundet ake	*Mulkul*	December	Muainonik
Mulkul	*Ngotiotet* *	January	
Ngotiotet *	*Kiptamo*	February	
Kiptamo	*Iwat kut*	March	
Iwat kut	*Waket*	April	
Waket	*Ngei* *	May	
Mamut	*Rop tui*	June	Iuot
Rop tui	*Puret*	July	
Pureto	*Epeso*	August	
Yepeset	*Mulkul oiew*	September	

132 The average rainfall at Kapchorua Farm, about two miles below the edge of the forest for the years 1929 to 1937 was 54.09 inches, the maximum being 66.17, the minimum 28.61. Details are given in the Appendix. In the forest itself I think the rainfall is undoubtedly a little higher, perhaps amounting to another 2-3 ins. in the course of an average year.

821 The Dorobo seem to have a better weather sense than the Nandi, and I found that they were generally accurate when making a forecast, whereas the Nandi are usually wrong when they try to foretell the weather. This weather sense is perhaps one of the reasons for their reputation among other [791] tribes as rainmakers; for these Dorobo not only say that they have no rainmakers, but I could find no trace whatever of rainmaking activities, nor any hint that they ever had any. Climatic conditions are such, however, that in a hunting economy rainmaking is not a necessity.

433 [311] [325] The environment of the Dorobo provides them with food, skins, wood, and other vegetable materials. Iron they had not, and they still have no knowledge of ironworking, though they use iron implements. Their activities comprised hunting, trapping, food-gathering, hut-building, the production of honey, and the making of objects of wood, leather, and grass, such as traps, arrow-shafts, bows, honey-barrels, clothing, caps, baskets, and handles for tools. ●439 Objects of iron they have got for as far back as they can remember from the Nandi by exchange for such things as they can make or produce themselves.

104 [4] Throughout this paper I have written the velar nasal by the sign ŋ, representing the "long-tailed n". In words marked * the first consonant is the velar nasal.

6:Huntingford E-5 (1938-1939) 1953 FL6 Dorobo FL6

eastern part of the area and towards Londiani. Monkeys and pigs are found both in and outside the forest; leopards live on the edge, and lions are still occasionally met with in the open country near the forest. Antelopes are still found, but they are not so plentiful as they used to be.

Honey is produced in honey-barrels. This constitutes a special department of Dorobo life, and will be described in § 2 below.

Wild vegetable foods which grow in and round the forest are eaten both cooked and raw as relishes or additions to the staple diet of meat and cereals; the task of collecting vegetable food is usually performed by the women. Recorded wild foods eaten are:

Fruit of the *silotik*, which are something like white currants, dried in the sun and eaten raw.
Fruit of the plant *momonyat*, rubus rigidus.
Fruit of the *lemeiyuet*, ximenia americana.
Fruit of the *sasuriet*, Musa ensete, the wild banana.
Leaves of the *siuot*, girardinia condensata, nettle.
Sap of the wild banana, eaten in place of what the Nandi call *kimiet* or 'porridge'.

Banana sap is collected by sticking a flat piece of wood into an incision made in the stem of the tree; a receptacle is hung on the end of the wood and left there for the sap to drip into it. The fruit of the wild banana (a very poor substitute for the cultivated kind) is placed on the drying tray (*sainet*) over the fire till it is roasted by the heat, and is then broken up with two stones and chewed; it is very hard. Tobacco is bought from the Nandi.

Before trade salt was obtainable through the Nandi, the Dorobo made a substitute from the leaves of the *tepenguet* bush (aemilia integrifolia), or of the *serenguet* tree. Leaves were burned, and the ashes collected in a suitable receptacle, a little water was poured on them and mixed, and the resulting liquid was added to food as needed. Some of the Bantu Kavirondo used to make a similar substitute for salt.

Intoxicating drink is chiefly made of honey, though now a little eleusine beer is made in the Nandi manner. The Dorobo method of making *kipketinik* or *kumik ap lo*, "honey-wine", is as follows. As a fermenting agent, the seed-pods of the *rotinuet* tree (kigelia aethiopica or the sausage tree), which may be as much as a foot long and four inches thick, are boiled till quite soft when they are cut into strips and put into the honey to make it ferment. A Dorobo description of the process of making the drink is this:

Kenam rotik, kepele mat si kokerer;
They-are-taken the-seed-pods, they-are-boiled-on the-fire that they-may-be-split;
kiune ilosto si kipete tukuk ce somisec kul
they-are-washed-in the-river that they-may-be-lost the-things which-are dirty till
kepumbunit. Kema si keyomio. Kiinde teret
they-become-soft. They-are-put-in-the-sun that they-may-dry. They-are-put-into the-po
ole mii kumiat puc, si konuanit, kiinde eŋgaret
where there-is the-honey only, that it-may-become-bitter, there-is-put the-wate

6:Huntingford E-5 (1938-1939) 1953 FL6 Dorobo FL6

it himself; but this was regarded as unusual in the case of a married man with a comparatively young wife (his wife Cepkumuren was at that time about 25).

While the sexes within the horde are interdependent, the horde as a whole is dependent on the outside world as represented by the Nandi. Not only do some Dorobo now actually live with Nandi, but they depend on them entirely for all their articles of iron, without which they cannot hunt. Socially, however, symbiosis is increasing. Sometimes unattached old men like Arap Cepsuku, who was about 70 at the time of my visit, live in huts occupied by Nandi: Arap Cepsuku himself was then living with an old woman at Kipkorom, sharing her hut, and growing a little eleusine at one end of her shamba, but merely as a lodger, having no sexual relations with her, for which both were too old. As he was a poor old man, she fed him and looked after him for nothing. This is true symbiosis, as the late Dr. SELIGMAN called it, and the principle is greatly extended by the Dorobo. For, whatever may be the collective attitude of Nandi to Dorobo, and of Dorobo to Nandi, the Dorobo depend on the Nandi for certain essentials, and the Nandi look to the Dorobo for certain things which they can get most easily from them. To the Dorobo, the Nandi, in the shape of the Nandi blacksmith, is indispensable, and the good will of the Nandi people is equally essential if they are to make use of his services.

The Dorobo do not specialize. Every man learns to make all the things he needs for bee-keeping and hunting (except those made of iron); every women learns to make baskets and prepare skins. The raw materials exist close at hand, and may be grouped under 5 heads:

(A) Wood: used for huts, implements, honey-barrels, traps, fuel.
(B) Plant material: used for food, medicine, salt, baskets, and tinder.
(C) Skins and other animal products: used for clothing, bags, roofs, etc.; dung, used to a limited extent for plastering walls.
(D) Earth and stone: coloured earth for painting; granite for grindstones; earth for plastering walls.

(A) Wood. The following trees are used for making weapons, utensils, etc.:

Kuriot (teclea sp.): bows; house-building; honey-barrels.
Masaita: arrow-shafts; firewood.
Koromandet: arrow-shafts.
Sosoiyat (bamboo): arrow-shafts; internodes used as water jars.
Ketuyuwet: traps.
Kimolnet (vangueria edulis): traps.
Keliot (acocanthera Schimperi): arrow-poison.
Lepekuet (dracaena sp.): house-building; honey-barrels.
Kipsepuet (tilia sp.): house-building; honey-barrels.
Marorta: house-building; honey-barrels; fire-wood.
Sasuriet (wild banana, musa ensete): house-building; honey-barrels.
Tenetuet: honey-barrels; fire-wood.
Poroet (liana): traps; honey-barrels; house-building; any purpose for which rope is required.

6:Huntingford E-5 (1938-1939) 1953 FL6 Dorobo FL6

313 *Rerendet* (euphorbia candelabrum) : honey-barrels.
824 *Mocet:* honey-barrels.
Oltamiyoit or *Yemdit* (olive, olea chrysophylla) : fire-wood.
Enyasieh: fire-wood.
Coruet (ficus sp.) : fire-sticks.
Teet (cedar, juniperus procera) : fire-sticks.

824 (B) Plant material. The following trees and plants provide material for food, salt, medicines, and utensils[*] :

[372] *Sasiat* (dry grass) : tinder for making fire with fire-sticks.
[285] † *Tapariet:* fibre for baskets.
Sosiot (phoenix reclinata palm) : fibre for baskets.
[278] † *Tiinet:* medicine.
† *Opeito:* medicine.
Rerendet: medicine.
Lepuyuwet: medicine.
Silotuet: medicine.
Seketet: medicine.
Usuet (ardisia sp.) : medicine.
[263] *Tepenguet* (aemilia integrifolia) : salt.
Serenguet: salt.
[273] *Rotinuet* or *Rotiot* (kigelia aethiopica) : making honey-wine.

825 (C) Skins and animal products. These include :

237 † Monkey : food ; clothing.
[241] † Antelope : food ; clothing ; bags ; quivers.
Pig-gut : bow-strings.
[411] Feathers : arrows.
† Honey : food ; wine ; ritual purposes.
Ram's fat : ritual purposes.
[583] Goats : bride-payment ; ritual purposes.
Cattle : bride-payment ; milk ; dung ; hides.
[412] Bush-buck : tails for brooms.

285 The basket most commonly made by the Dorobo is the small *herepet*, about 6 inches deep and 6 ½ inches wide at the top. This kind of basket is used a good deal by the Dorobo themselves, and is also a frequent article [439] of sale or exchange to the Nandi : *kinapci hereponik Nandi*, "we make baskets [461] for the Nandi", as an old woman said. Dorobo women make baskets when they have nothing particular to do, just as European women knit. The materials used are fibre from the midrib of the *sosiot* palm, which is split into thin strips, and bast from a plant called *tapariet* which is used for sewing the coils of fibre with the aid of a small needle (Fig. 1).[1] The basket maker starts by splitting the *sosiot* fibre, preparing a certain length and biting it off as she

[439] [*] Things marked with a dagger † are used in the preparation of objects given to the Nandi in exchange for their products.

[1] [i.e. see category 116 & 617 - ANALYST.]

6:Huntingford E-5 (1938-1939) 1953 FL6 Dorobo FL6

wants it, i. e. as the loose end gets thin, a new end is shoved under the binding; the bast is kept handy in a bundle. The technique is a spiral foundation with a flat, then gradually ascending coil, of the simple over-sewn type, and bee-skep variety, the stitches being spaced out and not close together. The base of the basket is formed of six fibre coils, sewn together with bast. A hole is made with the needle, and the bast is pushed through it. At frequent intervals the fibre and the bast are moistened with the lips. After the first six coils, a slight rise is made: as each coil makes a complete circle it is slightly raised in order to make the bend between the base and the sides. When a new piece of bast is needed it is shoved right through the hole, leaving about ½ to 1 inch on the other side, and is sewn through as before. The basket maker works with lengths of bast of 6 to 12 inches. The fibre coil is of about the thickness of a pencil, and this must be maintained. When the length of fibre is reduced to about 2 ft. it begins to get thin, and some new strips must be added by chewing off a further length. The structure of the basket is thus, in effect, a continuous coil of compressed fibre, each line of coil tied to the next by stitches of bast. Sometimes the base is made of a circular piece of leather, to which the first coil is sewn, the rest of the procedure being the same as for the all-fibre basket. 285

The dressing of skins, including those used for exchange, is a simple process, for no chemical agent is applied. The newly flayed skin is tightly pegged out on the ground while it is still wet and left to dry in the sun. When dry, it becomes stiff, and in this state it is rubbed with an axe-blade held at an angle of about 20°, the blade being rubbed backwards and forwards till the skin is soft and supple. If it is to be used for a woman's garment or other object in which fur is not needed, both sides are rubbed. Skins are dressed by women. Apart from clothing, the chief objects made of skin are bags, quivers, and parts of tobacco-boxes. The material used for sewing is generally pig-gut. The needle of course has no eye, and the method of sewing is therefore to make a hole with the needle and then push the gut through it. Bags, *motoket*, are used for many purposes, including the carrying of honey and coloured earth. They are generally made of antelope skin (e. g. blue duiker), and unless intended for honey the fur is left on the outside. They are provided with a flap, a strap for fastening and a sling for carrying them from the shoulder. A common size is 7 ins. by 6 ½ ins., but I have seen them as big as 18 ins. by 16 ins. Tobacco-boxes are made from internodes of bamboo, but they have leather covers at each end, and a thin leather strap is sewn to the covers so that the owner can sling the box round his neck. 281 [462] [415] [283] [412] 415 [825] [276]

The nature of Dorobo life demands exchange of products with the Nandi. The most important of the products they get by exchange is ironwork; other things are pottery, beads, tobacco, cereal seeds, and cattle, and a fairly definite, though possibly fluctuating, scale of exchange values has come into existence. In 1939 some of these values were: 434 435

1 axe for 1 bagful of honey.
1 arrowhead for a gourd full of honey.
2 knives for 1 day's weeding in the blacksmith's shamba.

6:Huntingford E-5 (1938-1939) 1953 FL6 Dorobo FL6

435 1 bundle of tobacco (about 1 lb.) for 1 bagful of honey.
1 large earthenware pot for 1 large prepared antelope skin.
1 small earthenware pot for 1 small prepared antelope skin.
2 baskets of cereal seed for 1 basket (*kerepet*).
1/- worth of trade beads for 1 gourd full of honey.

[804] The bag used as a measure for honey is the smaller size of *kerepet*, measuring 7 or 8 ins. by 6 ½ or 7 ins. The gourd is about 10 ins. long. The large pot stands about 20 ins. high, the small, about 10 ins., and the large antelope skin is usually a bushbuck, the small one a duiker.

437 There are no special market places or places of exchange. The Dorobo
434 go to the nearest smith or potter and make a bargain, returning later with
[443] the exchange equivalent to collect the goods. There is no language difficulty
[197] in these transactions, for the Dorobo language is no more than an easily understood dialect of Nandi. Getting iron or pottery means going into the Reserve, but to get seeds, tobacco or beads they need only go to the nearest friendly Nandi who has what they want and is willing to make the exchange. Sometimes plant material of medicinal value (i. e. what they think is medicinal value) is substituted for some of the regular exchange articles, but the above list represents the ordinary practice. When Dorobo have money with which to buy what they want instead of exchanging goods, they have the choice of going to the shops at either Songhor in the south, or else at Aruos in the Nandi Reserve, where there is a collection of Indian shops. The men do not
[562] like their womenfolk to go to these places unescorted, but occasionally some of the bolder ones try to slip away unobserved to Aruos ; they seldom go to Songhor, as it is in the European area.

476 No human group can exist without some form of co-operation, and even when a man lives alone, as he may have to among the Dorobo, he is not because of that cut off from or unable to share in the activities of his horde. Within the family people are interdependent, and in the settlement they help each other. The main activities in which people normally co-operate are four in number : 1. House-building ; 2. Hunting ; 3. Digging earth ; 4. Cultivation.
[462] (1) Building huts is women's work, which a man will do if he has no wife, and
[224] for which he will get help from a relative or clansfellow. (2) When people hunted game they usually went out in parties, and the kill was shared among
[317] them. (3) Digging earth means a journey of anything up to 16 miles round the edge of the forest and into country where nowadays there are strangers, so people find it both safer and more convenient to go in parties, for though they are in no danger of being attacked, their unconquerable shyness demands numbers to give
[241] confidence. (4) In a family or clan group, though each individual has his own shamba, he will expect both to help and to be helped by the other members.

[276] Together with the spirit of co-operation is the rule of joint consumption. We have already seen how meat is shared according to definite rules ; and among the Dorobo certain other things which are hard to come by must also be shared. The chief of these is tobacco, of which when a man has acquired even a small supply, he is supposed to give some to his father, to his wife's

6:Huntingford E-5 (1938-1939) 1953 FL6 Dorobo FL6

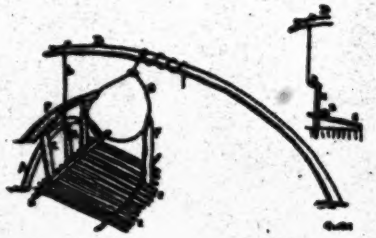

Fig. 5. A Simpler Kind of Springe. This trap has no "trigger-peg". The animal treads on the platform and by so doing presses it against the upright K to which liana *b* is attached, thus releasing the liana and allowing the bent stick D to spring upright and tighten the noose round the neck of the quarry.

when an animal treads on it, allowing the liana to slip over the top and thus release the bent stick D.

Hunting parties might be made up by as many as eight men, though I think that probably four or five was a more usual number. A common practice was for half the party to work along one bank of a stream and the rest along the other bank, so that if there was nothing on one side, those on the other side might be more successful; or if the quarry got across the stream, the men on the other side would be able to deal with it. When a kill was made, all the hunters assembled. The animal was skinned, the meat cut up, and some of it eaten on the spot, either raw, or partly cooked by laying it across a rough wooden framework over a fire. The rest of the meat was divided among them and taken home. In the best days, when meat was plentiful, what was left over was dried and kept either as a reserve or else exchanged with the Nandi for eleusine and millet. A stack of dried meat (*sirikeniot*) about 2 ft. square, was sold for about 25 lbs. of grain. Meat is cut into strips (*sir*, whence *sirikeniot*) which are laid out on the drying tray or loft over the fire to be smoke-cured after being dried on the roof of a hut or in the fork of a tree.

c) Agriculture

Since they can no longer hunt, and present conditions are[18] not favourable for the acquisition of cattle on a large scale (even if the Dorobo had the means of so doing), the adoption of agriculture has become an economic necessity, and methods, implements, and seed have been obtained from the Nandi. This change from hunting to agriculture has taken place virtually between the years 1927 and 1938. In the first of these years the area cultivated by them was so small as to be negligible; but by the latter year their lives were, as we have seen, to a great deal centered on agriculture. And as with hunting in the old days, so with agriculture to-day, the growing of crops is naturally regulated by the wet and dry seasons and the main divisions of the agricultural year are:

January to April: preparation of the land.
April-May: planting.
September: reaping.

[18] This refers to the years 1938-39.

6:Huntingford E-5 (1938-1939) 1953 FL6 Dorobo FL6

241 [221] The planting and reaping periods vary according as the rains are early or late. Between them there is a time when the crops have to be weeded, and after that for two or three months a time when little need be done to the crops but guard them against animal depredations.

The Dorobo grow two main crops, *pêk* or *paiek*, eleusine coracana (commonly known in Kenya as *wimbi*), a short gramineous plant bearing a head composed of small grains; and *ipandek*, maize. Millet had not been [439] adopted by 1939 as a cultivated crop, and when wanted had to be bought from the Nandi. As a subsidiary crop, sweet potatoes, *ropoonik*, are grown to a small extent.

[412] [439] Implements are confined to the hoe (*mokombet*), axe (*ndolut*), and ordinary knife (*cambolucl* or *rotuet*), though the use of the *panga* or cutlass is spreading. Hoe-blades (made by Nandi smiths) and *pangas* (sold by traders) are got from the Nandi in exchange for baskets, honey, or skins. The bill-hook, though used by the Nandi had not been adopted by the Dorobo in 1939.

The ground is prepared in the same way as by the Nandi. The top soil is dug with the hoe, collected into small heaps, and fired; it is left smouldering for several days and the burnt earth and vegetable ash are then spread over the plot and dug in with the hoe. Seed of maize and eleusine is [439] bought from any Nandi who is willing to sell it, usually one of the numerous [435] squatters on the nearby farms [19]. The Dorobo get two basketfuls in exchange for one basket. Potatoes (when not got in the same way) are generally grown by themselves, but maize and eleusine are planted together in the same plot so that the eleusine grows up between the maize plants. Maize has thus to be sown wider than is really economic, but it is a Nandi habit, and in favour of it one may say that the intervening spaces are partially covered and thus there is a chance of preventing some erosion in the early stage when the ground is clean, for when the crop is a few inches high, people turn out to weed, a process repeated if the land gets very dirty.

[417] Each shamba is surrounded by a fence made of thorns and bushes, with occasional posts to strengthen it where necessary, and trees or stumps are included in the fence when they occur in suitable positions. Sometimes there is a gate formed of movable upright poles, like the gate of a Nandi cattle enclosure, but usually the line of fence is unbroken, and access is by way of a rough stile of logs laid across the thorns.

243 Eleusine is reaped in the Nandi fashion by cutting off the heads with a knife, the straw being left to be trampled down and eventually dug in — that is, if the shamba is to be planted again. Maize is picked by hand, but in 1938 it was largely eaten on the field as the cobs developed, so that by the time it was fully ripe there was not much left to reap. By 1938, however, some [177] Dorobo at Kipukua, noticing the European practice of stooking maize in rows before it is ripe, cut and stooked their own in the same way, though they did not understand why it was done by the Europeans, whose object

[19] A Squatter is a "resident native labourer" living on a farm under contract with the employer.

6:Huntingford E-5 (1938-1939) 1953 FL6 Dorobo FL6

is to get as much as possible of the crop out of the way so that ploughing can start at once without having to wait till the crop is ripe. But the Dorobo had, all the same, made a step forward, for a solid, compact stook is less likely to be devastated by animals than plants standing scattered over a field.

By 25 November, 1938 the Kipukua people had reaped their crops. The shamba here was about an acre in extent, and was divided into four approximately equal-sized plots. There was little maize, for some had been eaten on the field and some had been destroyed by vermin; what was left had been stooked, and anything like an accurate estimate was impossible, though there might have been two or perhaps three bags in the stooks. If we estimate that the equivalent of two bags might have been eaten, and two more destroyed by vermin, we have about 6 or 7 bags, a somewhat high estimate for a crop grown mixed with eleusine, but not impossible [89]. Of eleusine, one plot yielded 3 bags, and another 2 bags (that is 5 bags from half an acre), not a great deal, certainly, but a fair yield under such conditions, and most useful as food, for the Dorobo eat most of their eleusine, and turn very little of it into beer. Maize and eleusine are ground by crushing on slabs of granite (*liteito*), and the resulting meal is made into gruel (*musarek*) for the children, and stiff porridge (*kimiet*) for the older people; it is generally eaten with a mess of vegetable food (*ingunek*) prepared separately.

Storage of crops is not yet a very difficult problem. A few of the Dorobo, it is true, have built granaries of Nandi type, hidden just inside the forest to prevent thefts by the Nandi, for anyone can lift up the roof of such a granary in the night. But since so much of the maize is eaten on the field, what is left at harvest time can be stored in the loft; and the same applies to eleusine, for it does not yield a large amount of grain. I saw no millet growing, and the Dorobo said they bought it from the Nandi.

As we have already noted, agricultural labour is divided to a certain extent between the sexes, but the distinction is not very sharp, and it was found to work out in the following way:

Men:	Both:	Women:
Heavy preliminary work	Digging	
Planting	Weeding	Collecting and burning weeds
	Reaping	

The heavy work includes lopping off branches in the Nandi manner, clearing bushes, and breaking up the ground when hard. Women may also plant, but the tendency seems to be for men to do it, though there is no absolute rule against women planting. Children help with the weeding, and herd the goats when there are any; old men herd cattle, and women also sometimes herd goats.

The Dorobo had not by 1939 acquired the Nandi belief that each eleusine crop requires new land, which in the circumstances is just as well; but they do not hesitate to give up using land which is unproductive. Thus,

[89] The bag is the standard 2 ½ lb. gunny bag used in East Africa, holding 200 lbs. of maize.

6:Huntingford E-5 (1938-1939) 1953 FL6 Dorobo FL6

241
[361]

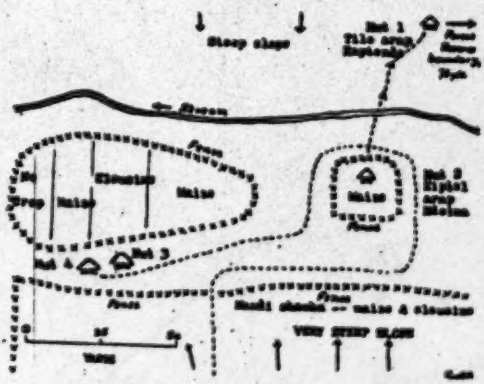

Fig. 6. Plan of a Dorobo Shamba at Kelpui alongside a Nandi Shamba.

at Kipukua in 1938 the crop was so much damaged by monkeys, pigs, and a sort of mole called *kesenïat*, that the original shamba had to be given up, and the occupiers took up new and separate plots elsewhere. Sometimes a Dorobo has a shamba all to himself; more often, however, several people divide the area inside a fence, each contributing to the labour of making it; [648] and in some cases Dorobo share part of a fenced shamba with Nandi (Fig. 6).

317 Though not connected with cultivation, we may mention here the subject of earth digging, because it is concerned with the ground. Red and white earth is found near Timboroa (or *Tambarua*, as the Dorobo call it), and men go in parties of four or five to dig it. They use nothing but a digging [482] stick, *kamet*, made of a sharpened stake, and the earth is carried home in large leather bags. In former days, when other Dorobo lived in the earth- [423] producing area, a digging party would ask leave to dig from the man who hunted over that tract of land, and though no fee seems to have been paid, it is said that if a man should refuse his consent, the party would go home without digging. But as no Dorobo now live there, this could not be 439 verified. To-day the Dorobo sell coloured earth to the Nandi, who pay them 435 at the rate of 2 shillings for a large bag of earth. Red earth, *erokoit*, is used 302 mixed with fat (or sometimes *simsim* oil) for rubbing on the head; white 789 earth, *euoriot*, is used as a magical remedy in cases of homicide.

d) Cattle

231 If the Dorobo had not been in such close contact with a people whose 177 primary interest in life was cattle, it is possible that they would have contented 181 themselves with agriculture and no live stock. But their relations with the Nandi have inevitably led them to take an interest in cattle, and to think that the [556] possession of cattle is a desirable thing. Therefore they are slowly trying to acquire cattle, and are in process of making them their ultimate objective. But

6:Huntingford E-5 (1938-1939) 1953 FL6 Dorobo FL6

they have been stock-owners for too short a time, and on too small a scale to have formulated or developed any cattle customs of their own; they do not think (like the Nandi) in terms of cattle; and their main efforts are at present concentrated on trying to acquire cattle. For the last, three ways are open to them, all slow and laborious: bride-payment, gift exchange, and purchase.

Bride-payment. A Dorobo whose daughter is married to a Nandi receives for her the number of stock that a Nandi would give for a girl of his own tribe, i. e. 1 cow and 1 ox or bull, together with a variable number of goats; and when a Dorobo marries a Nandi woman he has to pay at the same rate. Arap Keter acquired his cattle from the marriages of his three sisters: the eldest, Kapotikuany, was married while his father was still alive, and on the old man's death he inherited the cattle paid for her; the other two, Cesum and Taprandic were married after their father's death, and the cattle for them (amounting in the case of Taprandic to 1 bull, 1 cow, and 5 goats) was paid to Arap Keter.

Gift exchange. Nandi from time to time make friends with Dorobo, chiefly for the purpose of getting honey. The first move after two men have come to regard each other as friends, *cornet*, is for the Dorobo to give the Nandi some honey, without expectation of any immediate return. After a time, the Nandi gives the Dorobo a goat, and thus the way is prepared for the handing over of cattle. Arap Minis became the friend of a Nandi at Ofieson called Kapkile, and eventually got from him an ox in exchange for a fur cloak; and on another occasion he got an ox in exchange for seven goats which he bought with his wages for working on a farm. Arap Korucu in his youth hunted at Kapiyet in Nandi, and shot *tisiet* monkeys, from which he made fur cloaks which he exchanged for cattle. To-day he has five head of cattle which are herded for him by a Nandi named Kipkurir arap Serem on Farm 1479: the Nandi looks after them in return for the use of their milk, Arap Korucu being given a small amount of it. This process of acquiring cattle is, of course, a form of purchase, but it is purchase under the peculiar conditions of forming a friendship by exchange of gifts first. The Nandi do not readily part with their cattle, and it is therefore necessary to lead up to the final stage, as the Dorobo regard it, by the preparatory exchange of other things. And as a method of acquiring cattle it is limited by the fact that the Nandi seem willing to exchange only male stock in this way, so that for female stock the Dorobo have to rely on bride-payment.

Purchase. The Nandi do not sell cattle to the Dorobo except as just described, that is, in the form of bride-payment or by exchange. But they will sell goats for cash. The Dorobo do not seem to care about sheep, for in 1939 none possessed any.

At the time of their move in 1937 the Dorobo were credited officially with a large number of cattle, some 2000 head in fact. But in 1939 the actual numbers that I saw and counted (and I have reason to believe that these were practically all they had) were very much smaller. The following list, while it may not be perhaps completely accurate, gives a truer idea of the real numbers. It will be noticed that there were few goats; some were undoubtedly

7: Wayland N-5 (ca. 1926) 1931 FL6 Dorobo FL6

beer called *mo* is brewed from *ripp*. Planting is done in a season called *Lembweng*, when there are, or should be, light rains. This is well recognized, as are two other seasons or months: *Lemeru*, a time of rain; and *Leishatte*, a time of much rain.

The Calendar.—The Wanderobo are very hazy about the calendar, and disagree among themselves about it. The "year" appears to be divided into six months, of which the following lists were compiled from those who pretend to know about them. No two agree, it will be noticed, except 3 and 4, which are probably wrong, for any informants displayed much uncertainty.

1.	2.	3.	4.	5.
Lebrupe.	*Lembweng.*	*Lebrupe.*	*Lebrupe.*	*Lembweng.*
Lemeku.	*Lebrupe.*	*Lembweng.*	*Lembweng.*	*Lemeru.*
Lemeru.	*Leishatte.*	*Leishatte.*	*Leishatte.*	*Leishatte.*
	Lemeru.	*Lemeru.*	*Lemeru.*	

Food.—In addition to the above-mentioned grain the Wanderobo will eat almost anything they can get their teeth into, but I do not gather that they will eat human flesh. They will devour any kind of antelope or pig, elephant, rhinoceros, etc., also carnivorous of all kinds, except the hyæna; nor do they eat chicken (the Dodoths say that this is because they—the Wanderobo—do not possess any) or snakes. Honey is greatly prized, and locusts are not far and wide in the town.

Division of Labour.—A man's work, except during the hunting season, is weed cutting and circulation on the crops, where his main function is that of a scarecrow. During the hunting season all the able-bodied men leave the village in search of game, which they spear and trap. On wet ground they will actually run down a buck. When the hunters are out, work in the fields and village is done by women, children, and old men. The boys help with the crops, and the girls are employed in the village grinding grain and fetching water with the women. The very old people sit about and take little active part in the life of the community.

Recreations.—The Wanderobo have no musical instruments. They rarely dance, and while the children doubtless play games I gathered no reliable information under this head.

Manufactures.—The Wanderobo are peculiarly wanting in this respect. They make neither baskets nor pottery. The former I did not see among them (the people were found to be using gourds as cooking pots). The latter is obtained from the Dodoths in exchange for tobacco. Their shields (*kwee*) are similarly obtained, while their spears (*kiri*) come from the Dodoth cemetery, just over the border in the Sudan. It is noticeable that they use the short stabbing spear. These, it may be noted, are the only trophy spears I saw in Kavirondo. They are headmarks (*ankidokong*) of Dodothic origin; as with all other tribes in this part of the world, they carry their water in gourds, upon which they frequently carve crude designs.

/54/

58. The Dorobo

The last name on the list of predecessors in the occupation of the land now held by the tribes of the Unit is Dorobo. Here again there have been much confusion and lack of definition, and in spite of the continued existence of 'pockets' of so-called Dorobo in many parts of East Africa we find ourselves beset with difficulties if we try to give a synoptic ethnological interpretation to the very numerous facts. Some would lump all the Dorobo together with the other trapping tribes and call them aboriginal hunting people of a Bushman type, explaining obvious departures from that type by infiltrations in varying amounts of Hamite and Negro blood. Others (including many Africans) think that the difference between them and the other tribes is simply one of culture[1], not of origin, that the Dorobo have so stay a step behind while the others, due in part to population-pressure, moved from the hunting-trapping-gathering stage to that of herding or herding-planting.

59. Joseph Thomson, in Through Masailand, written in 1883 or thereabouts, gives the following account:

> "This tribe - the Wa-okeeboo of the Wa-swahili - is a small race of people scattered over Masai-land who gain their entire livelihood by the chase. They neither keep cattle nor cultivate the land. The antelope, the buffalo, and the elephant supply them with such meat as they may desire, while they always find neighbouring tribes...[illegible] in hunting, eager to exchange vegetable food for game. The elephant, however, seems to be their staple food, and as a rule the Andorobbo are to be found only where these animals abound; as for instance

1. To the Mwindo or the peasant some Mwaki signifies a Mwindo who, while engaging in hunting and trapping, lives in a settled village among the agricultural Mwindo, while Dorobo signifies a Mwindo (or anybody else) who lives in the forest and takes no part in agriculture.

B.Lambert--2 C-5 (ca. 1930-1949) 1950 FLS Dorobo FLS

/34 cont'd/

to the dense forests of Kenia and Kilimanjaro, the forest-clad escarpments of Mau, the top of Elgeyo, Marsabit, Chibcharagua-ni, Baro, Dondera etc. They are rarely found in numbers and usually in very small villages, so that there is nothing like tribal /35/ life among them. They enjoy considerable immunity from attack by the Masai, as they are sources of wealth to the latter by attracting the coast traders: usually, too, the Masai fall heir to a considerable share of the ivory. They also act as go-betweens or middlemen in getting the married people the vegetable food they require. To such an extent is this system carried, that on the plateau to the east of Naivasha at the place called by the traders Masai-ni, a very large village of [illegible] gives up hunting, and almost entirely by buying vegetable food from the Wa-kikuyu and selling it again to the Masai or it may be the traders.

"The language spoken by the Andorobo is allied to that of the Masai, but they can all speak the latter in its purity. They build regular villages, and in general appearance they resemble the inferior class of Masai. As I have already remarked, they make the buffalo-hide shields of the warriors as well as the coarse earthen cooking-pots of the women. They are on the whole looked upon as a species of serf, and treated accordingly. Their connections with the traders must be done secretly, or everything would be stolen from them."

Mr. C.W. Hobley, in the glossary to his Eastern Beliefs and Magic, says:

"Dorobo in Masai means arrow fly. The name for an aboriginal race of hunters who inhabit the great forests of the highlands in East Africa. They call themselves Ari and the Kikuyu call them Aciri. The name of the Athi River is believed to be a corruption of Aciri."

/58 cont'd/

intravenously by wholesale rape rather than transfused by peaceful penetration, raised a type of humankind (some of the tribes we have with us today) inferior to themselves. There is very little in general principle common to these two views except that the Dorobo, if it interests them, can claim some small degree of aboriginality in both.

64. Dr. L.S.B. Leakey told the Land Commission:-

"... there are Dorobo and Dorobo. There are Dorobo who are the nucleus of the Dorobo and are a tribe quite distinct from anything I know in this country. They speak a language which I have completely failed to connect up with any of the languages spoken by the other tribes here. There are two or three families living on the Mau today. Round that nucleus you have deserters from Masai, Kikuyu, Nandi, Lumbwa, and all sorts of other people. You thus come across a mixed Dorobo people who have left their tribes and become Dorobo in the wide sense. Up behind Kijabe there are innumerable families, half true Dorobo and half Kikuyu .... They call themselves Kikuyu, but live like Dorobo ..."

65. Modern Kikuyu opinion among the older men is that the Dorobo, though legends suggest a remote relationship with the Kikuyu as well as others, were a separate tribe, speaking a language of their own, who subsequently became mixed up with other people who adopted their way of life. Some identify them with the Il-Kunono of the Masai, but the Dorobo of Karura repudiate this and point out that there were no smiths among them and that they bought their spears and iron implements from the Masai and, later on, the Kikuyu. Mr. Jomo Kenyatta, however, regards the Dorobo as a Kikuyu-Gumba blend. In Facing Mount Kenya he writes:

"... soon after the Gumba had disappeared as a race, there came into being another race of hunters known as Ndorobo or Aathi, who seemed to have grown like mushrooms in the forests.

Gdambwi--13 G-S (ca. 1935-1969) 1950 F16 Dorobo F16

/50 cont'd/

from the north and east which forced the Bantu /51/ immigrants in turn to settle down to a more intensive agricultural life in the higher, safer country, where by an exploitation of the forest soils a density of population hitherto unknown in Eastern Africa could be maintained by shifting cultivation. One can well imagine that this change in subsistence-culture was not an altogether welcome one to the Bantu tribes who had hitherto lived on game and other natural produce of the plains and occasionally reaped, perhaps, some short-term annual. Increasing population-density as well as virile enemies had forced a settled life of agricultural drudgery on the Bantu, especially on their women. Many, no doubt, would try to retain the freedom of the former life by wandering in the forests and any other kind of country still unoccupied, provided an adequate supply of game and water could be found there. So there would be some slight degree of inter-penetration and intermarriage, and the pre-Dorobo tribe would undergo some change from blood-infusions of a Bantu type. Others of the pre-Dorobo tribe would find themselves excluded from the lower forests by the increasing mass of Bantu immigrants and, to a large extent, excluded from the plains as well, by Hamite tribes with mobile armies well organized for war and raptue. These others would, no doubt, either be destroyed or move still further off or, if they stayed and managed to survive, be relegated to a state of semi-serfdom[1].

1. So one hears of Nandi Dorobo, Kikuyu Dorobo, Lumbwa Dorobo, and so on. The "Dorobo Commission" remarked that the Sanye were actually slaves of the Galla and had for ages acted as their hunters and that those living in the Giriama Reserve had passed from the ownership of the Galla to that of the Giriama. But probably protection would be a better word than ownership, the relationship being a symbiotic one on ostensibly equal terms, for as the Commission remarked the Sanye supplied ivory and meat to the Giriama in exchange for beer, poison and maize. The position of all such Dorobo appears to be dependence on the protecting race for livelihood, whereas the protecting race merely depends to some extent on the Dorobo for hunting and service. The institution of "Sheger" among Somalis and similar peoples seems to involve the same idea of inverse status and dependence of the Sheger section, who none the less retain a theoretical freedom in the body politic.

/83 cont'd/

"There are nine groups of true Dorobo in Kenya Colony, and a tenth, called Il-Mukogodo, who do not appear to be true Dorobo."

648
101

That the Mwimbi had a good deal more intercourse with the Dorobo or the Mweiko or both than they are prepared to admit in open baraza seems to be indicated by the fact that the Meru proper associate the Mwimbi with the Dorobo and call the Il-Imwesi the Mwethi or the Mwimbi Dorobo, and say that the present Mukogodo, whom they sometimes call Mukuru, contain numbers of Mwimbi Dorobo and some Mwimbi who went off with them. A Mwimbi elder told me (not in open baraza) that not long ago there were Dorobo living close to the Mwimbi and trading skins with them for grain. Their leader was named Thiathui or Chachui and he went off somewhere to the north with most of his people.

[494]

/84/ 72. Dorobo and Chuka, etc.

There is very little evidence of any contact between the Dorobo and the Mothambi, Chuka, Embu or Mbere tribes. No doubt there had been such contact in the past, but possibly it was so long ago and so slight that any memory of it had faded before the European occupation. But that the minor tribes knew of the Dorobo is evident from the fact that they distinguished them from the Gumba in answer to Major Orde Browne's enquiries. It may be that the east and south-east of the mountain had not been occupied by the Dorobo at all or, more probably, that there was so little distinction between the minor tribes and the Dorobo in general culture and appearance that the latter left a less lasting impression on the tribal memory than the very much more primitive and strikingly different Bushmen. Since the ice there is credible evidence (put advanced by the Embu) of a Dorobo settlement near Manyatta Camp in the Embu District about the beginning of the present century, and that there were Dorobo in Mwea, not far from the territories of the Embu, Mbere, Gachugu and Ndia, in the vicinity, in fact, of two of the most important sacred groves of the two former tribes, is suggested by

[P. 192, A]

Both the social and the economic ranges of the Dorobo are very narrow. The family is a self-supporting unit, and a group of families forms a social unit; but the group is isolated, and the groups cohere through their strong clan solidarity and strict exogamy. There is no "tribe" as e.g. the Nandi, but a collection of family or clan groups forming a *kwet* or district, and a collection of such groups within a given area having a common organization, customs, and dialect, and the innate idea that "we are the Dorobo of such-and-such a place." Thus the Kapchepkendi Dorobo (with whom this paper deals) distinguish themselves from the Dorobo living on Tindiret hill, though that hill is only some seven miles from Sowiyo. (See map of the Dorobo country.) Before the Government dispersed them the Dorobo possessed, more or less undisturbed, the whole of the forest. Now they have no land at all. But they maintain their solidarity in spite of disruption, by means of their isolation, strong clan-system, and the fact that outsiders, e.g. the Nandi, are half afraid of them (so long as they do not go into Nandi), as being rainmakers and magicians of no mean ability, a people who are, in fact, somewhat uncanny. Their external relations may be described under three heads as (1) acquisitional: exchange of goods and services with the Nandi, and, till about 30 years ago, with the Uasin Gishu Masai; (2) restrictive: the Government raids them for taxes, and takes away their land, which leads to (3) an attitude of deep suspicion towards all Europeans, though they are driven by economic pressure to work for them.

Productive activities are concerned with the following:

A. *Food*: meat (by hunting and trapping), honey, wild plants, *chemisio* and maize (grown or obtained), milk, maize meal, salt and beer.

B. *Non-edible*: houses, weapons, implements, utensils, clothing and ornaments (except of iron), firewood, traps, honey-barrels, coloured earth (which is dug in the eastern part of the forest and sold to the Nandi for cash.)

C. *Raw Materials*: wood, plants, and skins.

The exchange of their own products for things they do not make is governed by natural resources,

[P.192, B]

and by personal ability, and therefore to some extent by their geographical setting. They have no iron ore, no metallurgic knowledge, and so all ironwork is imported from the Nandi. Tobacco, which they like, is not grown as yet, and this too must be obtained from the Nandi. There is a regular exchange of honey, skins, and baskets, for arrowheads, knives, tobacco, seeds, pottery, etc., and a scale of exchange values has come into existence:

1 arrow head is given for a gourd of honey.
1 bundle of tobacco is given for a bag of honey.
1 large pot is given for a large bushbuck skin.
1 small pot is given for a duiker skin.
2 basketfuls of seed for one basket.[1]

Sometimes personal services are given, e.g. a day's weeding in the smith's garden for two knives.

Cattle are obtained from the Nandi, to a limited extent, by a system of gift exchange for furs. The Nandi make friends with the Dorobo chiefly for the purpose of getting honey, and the Dorobo will give some to his Nandi friend without expectation of an immediate return. Presently the Nandi gives the Dorobo a goat, and this exchange of gifts paves the way for further and more important transactions: eventually the Dorobo offers his friend a fur cloak for an ox, as e.g. my friend Arap Misiq acquired one from a Nandi called Kapkile at Ollesos; he also got another in exchange for 7 goats, which he bought out of his wages for working on a farm.

C. *Techniques*

1. Hunting

The dry weather, **ssssiosuik**, is the shooting season, and the wet weather, *ilmit*, is the time for trapping. The weapon is the bow and arrow (spears are not used by the Kaptherpkendi Dorobo), and the hunters use dogs.

In wet weather buck are caught in traps. In the dry season, wild pig of various kinds[2] were

[1] A honey-bag is about 12 ins. deep, and 8 ins. wide; it contains about twice as much honey as a gourd. A basket (*korogut*) is about 6 ins. deep and 6½ ins. wide at the top.

[2] *Tumdo*, the wart-hog (*Phacochoerus aethiopicus*); and *Tirgut*, the giant hog or bush-pig (*Hylochoerus Meinertzhageni*).

4133 439 [325] [135] [276] 436 439 648 [231] 221 411 [231] 224 [415] [136]

he found hunting on his area, though he would be liable to pay blood-cattle for homicide.

As for trapping, it is said that nobody steals meat from traps because their bellies would swell to a great size if they ate stolen meat. Public opinion, too, is strongly against such a mean crime, and is of itself a powerful deterrent. Nowadays trapping is the chief source of meat, and the common practice is for a man to set three or four traps at a time in different places, and to visit them every two days or so to see if anything has been caught.

Monkeys and buck[1] are killed for their meat and skins; pig provide meat and gut for bow-strings.

2. Agriculture.[2]

The Dorobo are in process of changing from a hunting to an agricultural existence, from the uncertain hunting economy to the more certain one of agriculture; and the same economic pressure which has forced them to till the soil is now encouraging a desire for cattle, which are being slowly and laboriously acquired. This leads in turn to a more self-supporting state, with less dependence on the Nandi for grain crops; and agricultural techniques, both in tillage and stock, are being learnt from the Nandi and from Europeans.

Both sexes work in the cultivated plots (*imbaret*), and are helped by children, who weed the crops, herd the stock, and milk the cows. The crops grown at present are eleusine (*eleusine coracana*, called *wimbi* in Swahili) and maize; millet and tobacco are still bought from the Nandi, from whom the Dorobo also get eleusine and maize seed when necessary. Unlike the distribution of the forest into hunting areas, people cultivate the ground close to their own homes, and a group

[1] The buck killed are:
Kipuchet, blue duiker (cephalophus sequatorialis).
Mindet, red duiker (c. ignu-lanuci.)
Kerrenuit, bush buck (tragelaphus scriptus.)
Irukutet, reed-buck
Kenyalet, oribi
Kipenuwet, water-buck (cobus ellipsiprymnus).

[2] I prefer the term 'agriculture' to 'horticulture,' for the latter implies mere cultivation, with no livestock, and in East Africa agriculture is almost always practised in conjunction with stock-rearing, even if only on a small scale.

6: Thomson K-3 (1883-1884) 1887
FL12 Masai FL12
Dorobo FL6

M 563 D 224 Before closing this chapter it may not be out of place to say a few words regarding a tribe of people whom I have referred to as the Andorobbo. This tribe—the Wa-ndorobbo of the Wa-swahili—is a small race of people scattered over Masai-land, who gain their entire livelihood by the chase. They neither keep cattle nor cultivate the land. The antelope, the buffalo, and the elephant supply them with such meat as they may desire, while they always find neighbouring tribes, less skilful in hunting, eager to exchange vegetable food for game. The elephant, however, seems to be their staple food, and as a rule the Andoroddo are to be found only where those animals abound; as, for instance, in the dense forests of Kenia and Kikuyu, the forest-clad escarpment of Maũ, the top of Elgeyo, Maragwet, Chibcharagnani, Buru, Dondolè, &c. They are rarely found in numbers, and usually in very small villages, so that there is nothing like tribal life among them. They enjoy considerable immunity from attack by the Masai, as they are sources of wealth to the latter by attracting the coast traders; usually, too, the Masai fall heir to a considerable share of the ivory. They also act as go-betweens or middlemen in getting the married people the vegetable food they require. To such an extent is this system carried, that on the plateau to the east of Naivasha, at the place called by the traders Mianzi-ni, a very large village of Andorobbo have altogether given up hunting, and subsist entirely by buying vegetable food from the Wa-kikuyu and selling it again to the Masai, or it may be the traders.

D [131] [361] M 563 D 439

M 563 D 192 105 The language spoken by the Andorobbo is allied to that of the Masai, but they can all speak the latter in its purity. They build regular villages, and in general appearance they resemble the inferior class of the Masai. As I have already remarked, they make the buffalo-hide shields of the warriors, as well as the coarse earthen cooking-pots of the women. They are on the whole looked upon as a species of serf, and treated accordingly. Their transactions with the traders must be done secretly, or everything would be stolen from them.

D 224 411 In hunting the elephant the Andorobbo use a peculiar weapon. In shape it is like the rammer of a cannon, the heavy head being intended to give additional weight in dealing a blow. In the thickened part is placed a weapon like a short but thick arrow, fifteen inches long, the head of the arrow being smeared over with the deadly poison of the *murúa*. The whole spear is little short of eight feet. With this the

/232 cont./

262 If lean times then come, one tries, as well as one can, to appease
the stomach with wild roots or tubers, with berries or other small
[252] fruits, with honey and honey beer. Meat is seldom eaten raw,
251 usually boiled or roasted at the open fire. For storage it is cut into
• 439 long strips that are hung to dry in the sun. When the meat is well
231 dried, it is stowed away in the aforementioned tree, close to the
camp; cattle and small livestock, which are bought from the Masai
262 for ivory, are not kept, but slaughtered immediately. Insofar as the
[439] Wandorobo, in barter with sedentary tribes, are able to come into
the possession of vegetables, they also live on these, but actually
only during times when, for some reason, only little game is to be
had. Otherwise the vegetable food acquired by trade constitutes
[272] only a side dish, especially for woman and children. Many of them
detest milk and base this on the fact that their stomachs, accustomed
only to meat diet from early childhood, do not tolerate it. Some
go so far as to throw away the udder of a slaughtered cow, although
[171] they eat that of a slain piece of game. There indeed seems to be no
doubt but that the previously mentioned Masai belief, according to
which milk and meat must not be brought together, rests on these
273 customs. Besides water, honey beer, which they make in the same
[271] way as the Masai, also serves them as a beverage. The latter prize
[171] that made by them more than their own, which probably rests on the
fact that the Wandorobo keep the good honey for themselves and sell
264 only the inferior kind. Men, women, and children eat together.
[252] Both the foods for the man, his wives, and children and, on the other
hand, those for the youth and his favorite girl are cooked in one pot.
[415] From this the food is poured into small wooden bowls (kitokog), of
273 which each adult sharing in the meal has his own. From the food
171 laws of the Masai, the custom that young unmarried men may not
drink honey beer is still found here as a survival. Tobacco is a
276 luxury of the married. Men smoke it, coarsely cut, in pipes carved
by themselves. Ground to powder and mixed with a little steppe
salt and /233/ fat, it serves both men and women for snuffing.
Women also like to chew the snuff.

/233 cont./

512 After breakfast the day's work begins. Huts must be repaired [356] and renovated, for which branches and twigs for the frame, bast for binding it, and long-stemmed grass for covering the roof and [462] lining the walls are procured. When the women are not busy with this, with cooking, with fetching water and gathering firewood, one usually sees them sitting in the shade with some handwork. They [294] sew clothing, bags, leather covers for the wooden pots, cut straps, [281] etc. Concerning the ornaments, the Wandorobo make for themselves 306 those things that the Masai also make for themselves; they only buy 439 the metal-forged work from Masai blacksmiths. The making of the 323 462

Fig. 81. (1/10)

ball-shaped earthen pots (Fig. 81) falls to the women. From dark-gray clay (anjet) they shape the pot with their hands (without a wheel) and let it dry in the sun, after it has been decorated, usually with cord ornamentation. Before being fired, it is usually stuffed with dried grass prior to being put in a fire made with dried tree bark with which it is entirely covered and in which it remains until it takes on a dark red color. The finished pot, in order "to protect it from cracking during use," is thoroughly heated on the hearth fire, and then boiling water, in which a bone has cooked, is poured in.

281 The dressing of the hides from the most recent hunting booty also takes a great deal of time. Those intended for sale are, of course, simply nicely cleaned of all meat and fatty parts and then, pegged to the ground with sticks, dried in the sun. The others, [171] however, which are to be used to make clothing, are worked into 000 leather in the way described for the Masai. As there, the tanned

294 412 283 /233 cont./ As there,[1] the tanned hides are sewed into articles of clothing with an awl (maramaog) and a thread twisted out of animal tendons (asug). If a number of hides for which, at the moment, one has no need for one's own • 439 437 use has piled up, a few old men with women and children, laden with skins and also steppe salt, set out for a neighboring area. Where the distance between this and the Wandorobo camp is such that it permits frequent trade, these caravans appear at the regularly held markets. If, however, they are able to come only rarely, they [805] peddle their wares, inasmuch as, out of ignorance of time reckoning, they do not wait for the market days. They readily find customers, since both articles are very much in demand. The agriculturalist principally dependent on a vegetable diet always needs salt, but he can only rarely extract it himself, since as a rule the arable soil contains no salt or such not in sufficient quantities. The need for hides /234/ is also often greater than the local production, even today when fabrics have largely replaced the leather clothing. After protracted haggling, an agreement is finally reached, and the Wandorobo, satisfied, set out for home with the bartered vegetables. If the hunting was sometimes particularly lucrative or if an elephant or rhinoceros was killed, part of the meat would also be sold to the always meat-hungry agriculturalists. Many of the latter, for example, the Wataita and Wakamba, also buy the meat of predatory animals from the Wandorobo, others disdain it altogether, and therefore, in trading, they test each piece for smell and taste.

231 [889] Old men, who only now and then in the evening lie in wait for game at a watering place, devote themselves outside the camp especially to the checking and supervision of the beehives (Fig. 82), a large number of which hang within an hour's range. These are wooden tubes 120 centimeters long and /Fig. 82 appears here/ 30 centimeters thick, with an interior breadth of about 25 centimeters. 231 322 412 They are made by hollowing out a correspondingly long piece of tree trunk, a very arduous task because the tools are so primitive. After the trunk, through hewing with an ax, appears circular in cross-section and tapered at both ends, it is smoothed on the outside with a knife (pandyug). Two instruments are used for the hollowing out:

1. [i.e., among the Masai--Analyst]

/235 cont./
411 322 [283] [237] with fat several times, it is bent over the fire. The string is plaited together, turning and braidlike, out of short animal tendons and is extended by further interweaving up to the required length. The projecting starting-ends of the individual pieces of tendon are neatly cut off, whereupon one then rubs the now finished bowstring with some fat.

The arrow shaft (Fig. 84) is carved out of a dry wooden stick, first rounded, then smoothed by scraping. The upper end is wound [237] [824] [412] with tendons that have been coated with the varnishlike juice of a not yet described species of gladiolus known as dirie, whereupon, on top, one drills in the one- /236/ /Figs. 83 and 84 appear here/ 411 centimeter-long hole for the tang of the arrow by a twirling motion [237] with a thin wooden chisel. At the lower end the three-part feather- [136] [283] ing -- out of the feathers of the carrion vulture (Neophron percnopterus) -- is first fastened on by being wrapped with a very fine [824] bast thread and then glued fast with the gladiolus juice just mentioned. Another wrapping of animal tendons is found between the feathering and the rear notch for the bowstring, in order to prevent a splitting of the shaft.

[325] [322] [171] [439] The people buy the iron points; only if a point breaks off /237/ do they as a rule forge a new one for themselves. Clubs are carved from a piece of wood, as among the Masai. They buy the spears, of which there are one or more in almost every camp, from the blacksmiths of the Masai. The spears serve as weapons only in the camp, where shooting with arrows is not permitted, on account of the danger connected with that, since they are always poisoned.

415 [439] [285] The Asá for the most part buy wooden bowls and gourd bottles from sedentary tribes. On the other hand, in some places they plait shallow baskets, which they use for storing food.

524 829 171 The fact that the Wandorobo do not play the board game so popular among the Masai was explained to me by them with the words: "During the game we would forget to hunt and then, with our families, would have to starve."

512 517 With the coming of darkness complete stillness as a rule comes over the camps, quiet even during the day; the day's work is done and everyone goes to his hut. Only on moonlit evenings do the old [273] [535] people often still sit in the open for a few hours, talking, with a gourd bottle of honey beer, while the young men and girls dance [533] and let their falsettosong ring out through the still night, from

IV.

000 Marital relations. -- Polygyny. -- Betrothal. -- State of being betrothed. -- Conversion of the young men to the state of the married. -- Bride price. -- Forcing the consent of the father of the bride. -- Exchange of wives. -- Obstacles to marriage. -- Entering into marriage. -- Dissolution of the marriage.

595 The marital relations also offer little that is new. Polygyny exists only to a limited extent; most of the people are too poor to acquire and support more than one wife; only a few have two wives, 584 and if a man has three of them it is a rarity. Betrothal in earliest 171 childhood seem to be more frequent here than among the Masai, but no more binding and without legal consequences. As a rule after circumcision the youth is betrothed to a girl eight to ten years old, after his father has proposed for him to her parents. As among the Masai, the /240/ betrothed persons live apart and may not even see each other. The bridegroom lives with a girl in the one camp, and [836] in the other, the bride with another youth. If the bride becomes [848] pregnant before the wedding, dissolution of the betrothal does not [684] always take place, as among the Masai, but rather the one who made her pregnant must reimburse the bridegroom by the payment of a head of cattle.

561 Here, just as among the Masai, the young men of an age class 582 together decide upon their entering the standing of the married, and 574 their fellow campmates confirm this intention by a feast correspond- ing to the ol geteñ l ol bɛ, in which friends and neighbors participate. [273] They are served game and honey beer, the latter of which, however, [224] the marriage candidates may not yet drink. They like to set the feast for the day after a successful elephant hunt, so that the guests can feast heartily on meat.

583 Before marriage can be entered into, the bride price is to be paid. The bridegroom usually gives the father of the bride, even [439] before her circumcision, five pots of honey and five beehives, and, soon after her circumcision, half of a slain female elephant with the tusk that belongs to it; furthermore, two head of cattle, which

/240 cont./

583 are bought from the Masai for ivory, and finally half of the meat of
[439] a slain female head of game approximately the size of a zebra. The mother of the bride and each of her brothers receive from the bridegroom a beehive apiece. Instead of the beehives the parents-in-law in some regions, especially where the Wandorobo live in close contact
[601] with the Masai, receive iron wire. After receiving the gifts, the bridegroom and father-in-law reciprocally call each other ba-geteñ, bridegroom and mother-in-law ba-ger, bridegroom and the brothers of the bride ba-suben, according to ancient Masai custom.

583 For beauties no higher price is paid. For a childless widow
587 the usual price is paid, but only after the birth of the first child and after her father has returned to the heirs of her deceased husband the price received for her before her first marriage. For a widow who gave birth to girls only, no bride price is paid; instead, however,
583 the heir of her deceased husband keeps her daughters. Likewise nothing is paid for a woman driven out by her husband. If the bridegroom dies before the marriage, his brother takes the bride.
[584] If the bride dies before the marriage or if the betrothed persons dissolve the betrothal, the portion of the bride price already paid is returned. A bridegroom who is too poor to be able to pay the full price serves the father-in-law for a few months as hunter for the ramainder owed.

584 If the father of the girl has stubbornly opposed the courtship, he is finally forced to consent by means of a divine judgment. The lover stealthily creeps into the hut of the old man and ties a
[784] rope of grass around the wooden honey pot. The father is said /241/
[583] to give his consent regularly then, since otherwise the punishment
[171] of God would kill him. In place of this custom, it also happens that the lover secretly takes the girl away, or the latter -- as among the Masai -- flees to him without her parents' knowledge.

837 Wife exchange occurs, but legal marriage does not arise from it. The woman does not remain with the other man for longer than a half to a whole year. If she feels pregnant before this time, she returns to her husband.

582 Among the Asa the same marriage obstacles hold as among the
171 Masai, but the great distances between the individual tiny camps

561 171 224 555 /244 cont./ elephants, buffalo, and lions, has distinguished himself through courage and decisiveness and who shows these qualities anew again and again is elected kirigit.

881 About the circumcision of the girls, it is only to be said that, adorned, a few days before the operation they set out for the neighboring camps to bid farewell to their younger girl friends. On these [425] visits they are permitted to appropriate anything that they wish (food, clothing, ornaments, etc.), without special permission from the owners.

Concerning the reason for the circumcision the Asá also say that God commanded them to undertake this on their children.

/245/ VIII.

000 Hunting. -- The weapons, bow, arrow, hunting spear. -- Ownership marks. -- Preparation and effect of the arrow poison. -- Treatment of arrow wounds. -- Stalking. -- Hunting dogs. -- Station. -- Battue hunting. -- Practice of hunting. -- Game. -- Superstition. -- Meat meals of the hunters in the bush.

411 [561] [224] For the dobonog of the Wandorobo hunting is what war is for the El móran of the Masai. Their principal weapons are bow and arrow. The two-sided bow ([Fig. 83] gari, geleweg) has the shape of a flattened segment of a circle. It is as a rule 1.50 meters long and very sharply flexible. With it belongs a leather quiver ([Fig. 85] madíet, madimoig) with arrows ([Fig. 84] mat, mara). The wooden arrow-shaft bears a small notch on its rear end for setting it on the bow string, and directly in front of it the three-part feathering (haiya). [439] The iron point, which the Wandorobo usually buy from Wakuafi and Masai blacksmiths, but also from sedentary Negroes, and more

/245 cont./

411
• [439]

rarely also make themselves, as a rule has the so-called arrow shape. It bears either a short, flat tang, which is lengthened by insertion into a cylindrical one ten centimeters long, or else the latter and the point are worked continuously out of one piece. Now an and then one also finds arrows among which the extension tang is made out of wood. These come from Ukamba, where the Wandorobo, who call them mijerá, have bought them. The tang is stuck loosely in the arrow shaft so that the latter can fall off when the animal has been hit. Less frequently they use wooden throwing-spears (Fig. 86) with a loosely inserted, poisoned iron point, which, like the arrow point, remains sticking in the animal hit, while the wooden shaft falls off. They also attack the sleeping rhinoceros and hippopotamus with a sharp sword, which they tie on a stick and use as a thrusting or throwing spear. One leaves this weapon sticking in the wound so that, if the animal flees, it cuts the entrails still more by striking on the ground and against the bushes. Both types of spear are called mucháa. Both the point and tang of arrows and throwing spears bear a filed-in ownership mark (Plates 5 and 6), by which one can recognize tribe and lineage of the owner, in order, upon finding a slain head of game, to determine its hunter. Like the ownership marks on the cattle and donkeys of the Masai, the symbols here are not the same for all Wandorobo, but vary more or less in the individual

000 /footnote 1 continued/ be a substantial therapeutic advance to be recorded here." From "Über Acocanthera Schimperi als Mittel bei Herzkrankheiten/On Acocanthera Schimperi as a Remedy for Heat Ailments" By L. Lewin and E. Stadelmann. From a report delivered to the Berliner medizinischen Gesellschaft /Berlin Medical Society/. Berlin, 1906).

278 824 Although the tree is not rare in the steppe around Kilimandscharo, its poisonous nature nevertheless generally seems to be known only to the Wandorobo, since other tribes do not manufacture the poison themselves. Thus the former sell it, for example, to the Wadschagga, the
• [439] Wakabe, the Wakuafi of Aruscha technical and of Meruberg /Mt. Meru/, the Wapare, etc. To brew the poison two Wandorobo always go a few thousand meters away from the camp into the bush. After they have collected branches and roots of Acocanthera abyssinica, they split them into thumb-thick sticks and prepare for the cooking in separate places. The wood is boiled for several hours in an earthen pot that is half filled with river water. Then it is removed, and the liquid obtained is thickened by further cooking to a viscous porridge-like consistency. The finished poison is black and looks like pitch.
278 572 834 [444] During its preparation no woman may come either in the vicinity of the poison pot or in that of the man doing the cooking. The woman who brings food and firewood therefore places these objects within calling distance. They believe that the effect of the poison is weakened or entirely destroyed through the contact or even merely the presence of a woman, whose person they, in their naïve beliefs, are unable to separate from the idea of sexual intercourse -- since the latter, according to their view, is an element acting against the poison. The same would be the case if the wife had intercourse with another man during the time the husband is busy preparing the poison, or if the husband cooked the poison while his wife was pregnant. The
[415] finished poison is stored in a wooden pot (madi) or in a leather bag /341/ (ambia), and, to be sure, like the quivers with the poisoned arrows, not in the hut, but hung on a tree not far from the camp.

/251 cont./

224 262 they particularly value the entrails and also do not scorn the meat of fallen or stricken animals; indeed, even the skin of elephant, rhinoceros, and hippopotamus is eaten roasted. As huntable, i.e., here [223] edible, the Wandorobo regard elephant, rhinoceros, hippopotamus, [439] pigs, zebras, all cloven-footed animals from the giraffe to the tiny dwarf antelope, hares, rock rabbits, and, of the birds, the ostrich, which, however, they shoot only on account of its feathers, which the Masai like to buy for the manufacture of the war head-ornaments. They do not hunt monkeys and lower animals, because they do not relish their meat.

224 On the day before the new moon, and in places also on the seventeenth day, the ol onjugi, no one goes hunting because, according to popular belief, one would not kill anything on the former day, whereas on the latter the bow would break. The red-headed Anaplectes [825] melanocis is regarded as unlucky for the hunter. If the hunter sees it [777] along the way he returns to camp immediately and does not leave it again until several hours later, in order to try his luck anew.

561 224 171 [178] Like the warriors of the Masai, the dobonog of the Wandorobo also hold their meat meals in the forest. Whereas among the former, however, these are a result of the food rules, according to which the warrior may not eat meat in the kraal, among the latter it is only a matter of observing an ancient custom for which there is no longer any reason today, since the unmarried man usually eats his meat food in the hut. On the other hand, there is greater justification for retaining the en dorik, where they strengthen themselves by a plentiful [262] [224] eating of meat for a larger hunting expedition for more distant and at the same time dangerous game, such as elephants and buffalo. The [263] many spices and stimulants that we became acquainted with among [276] the Masai are also used by the Wandorobo, but to a far lesser extent. They do not divide up into fellowships for the meals in the bush, but 561 224 only for the hunting expeditions. Each company, as a rule, consists of four men and is called e sirigi, in which one recognizes the present Masai word en sirit. The booty is divided among the participants in [574] equal parts. If an individual hunter or an e sirigi spends the night in a strange camp, the host is given a foreleg and a hind leg of the hunting booty.

/251 cont./

IX.

000 Clothing and adornment. -- Cloth materials. -- The individual articles of clothing and adornment, compared with those of the Masai. -- Head and body hair. -- Nails. -- Painting. -- Tattooing.

• 439 648 179 Cloth materials, such as are the tender of the caravan people in the barter trade, have been adopted only to an extremely slight extent among the Asá. The principal reason for this is that they only rarely come into direct contact with the caravans; rather, under pressure from the Masai, /252/ they are forced to deliver to them their yield in elephant tusks, hippopotamus teeth, and horns of Rhinoceros bicornis for a small compensation. There is no question of a legal barter trade: the Masai buy [wa ngovo] with force, as the coastal peoples so aptly designate this type of trade.

291 191 [511] One therefore sees the Asá almost solely in their original leather clothing (hide worked into leather, mpanga, mpandoi), which, in cut and manner of wear, is identical with that of the Masai, but looks poorer and often ragged. This poverty is particularly noticeable for the boys' and maids' capes, called e mpiti and en jorika by the Masai, which the Wandorobo name the same, and which here are also worn by older men because in hunting the ol gela is too inconvenient because of its length. The dahonay otherwise do not generally wear the e mpiti, rather more often an en jorika made of calf hides, which they buy from the Masai; older men often have it made out of the hide of the female black-backed antelope. The caracara of the women is here called [561] [237] [439] ppa (pl. ppá), as is the upper part of it (ol ogiriaibo of the Masai) by itself, while the lower one is named after the Masai designation ol ogemana gemána (pl. gemanáe). The ol gela i ol murrah is here called ppa o dahona and is considerably shorter than the former, only a little longer than the en jorika. Sandals (mpika) serve them as footwear, which, however, in general are not used. In adornment 301 561 832 the poverty of the Asá is shown particularly among the dahonay, though one must also consider that their desire for favor in the eyes of the fair sex is, as a result of circumstances, very considerably less than

/304 cont./

[302] [301] The Wandoobbo only very rarely use number words, since they actually /222/ have nothing to count; the only thing suitable for this would be their beehives, and they do not count them, because -- as several people explained to me -- the bees would then no longer gather honey '8' -- as others opined -- would die. When, nevertheless, they need number words, they in general use, both in intercourse among themselves and with strangers (bees that we become familiar with above for the bimet, and, to be sure, in the same way and with the same hand or finger movements. As Ca people stated, all Ané and also the other Wandoobbo use these number words, which seems credible to me since I myself did not meet anyone who was not familiar with them. In addition, in the barter trade with agriculturalists, they have also assumed some of their number words and in part mutilated them into a form more suitable for them. Finally, among the Ané a few have kept their own, which, together with some borrowed from the Tsonga speech, are designated today as their own. They are the following:

[120] [192]

[339] [192]

[192]

1 = kinâ.	The index finger of the left hand is extended, the other fingers lie loosely in the hand.
2 = kêm.	Index finger and middle finger of the left hand are extended, the others as before.
3 = ximâ or xinâ.	Index finger, middle finger, and ring finger of the left hand are extended, the other as before.
4 = lê or lêy.	The four fingers of the left hand are extended, the thumb lies loosely in the hand.
5 = nîh.	The left hand is closed into a fist.
6 = lo.	The same signs as before, but executed with the right hand.
7 = loxîn.	
8 = lelî.	
9 = nukwalî.	
10 = ngwîgwî.	
11 = ngwîgwî kinâ.	
12 = ngwîgwî kêm.	
13 = ngwîgwî a nxwe	(or ngwîgwî a xwe).
20 = zîlîn.	

1 bundle of tobacco (about 1 lb.) for 1 bagful of honey.
1 large earthenware pot for 1 large prepared antelope skin.
1 small earthenware pot for 1 small prepared antelope skin.
3 baskets of cereal seed for 1 basket (bengat).
5/- worth of trade beads for 1 gourd full of honey.

The bag used as a measure for honey is the smaller size of bengat, measuring 7 or 8 ins. by 5 ½ or 7 ins. The gourd is about 15 ins. long. The large pot stands about 20 ins. high, the small, about 10 ins., and the large antelope skin is usually a bullock, the small one a duiker.

There are no special market places or places of exchange. The Dorobo go to the nearest smith or potter and make a bargain, returning later with the exchange equivalent to collect the goods. There is no language difficulty in these transactions, for the Dorobo language is no more than an easily understood dialect of Nandi. Getting iron or pottery means going into the Reserve, but to get seeds, tobacco or beads they need only go to the nearest friendly Nandi who has what they want and is willing to make the exchange. Sometimes plant material of medicinal value (i. e. what they think is medicinal value) is substituted for some of the regular exchange articles, but the above list represents the ordinary practice. When Dorobo have money with which to buy what they want instead of exchanging goods, they have the choice of going to the shops at either Songhor in the south, or else at Aruwa in the Nandi Reserve, where there is a collection of Indian shops. The men do not like their womenfolk to go to these places unescorted, but occasionally some of the ladies save up to slip away unobserved to Aruwa; they seldom go to Songhor, as it is in the European area.

No human group can exist without some form of co-operation, and even when a man lives alone, as he may have to among the Dorobo, he is not because of that cut off from or unable to share in the activities of his kind. Within the family people are interdependent, and in the settlement they help each other. The main activities in which people normally co-operate are four in number: 1. House-building. 2. Hunting. 3. Digging earth. 4. Cultivation. (1) Building huts is a woman's work, which a man will do if he has no wife, and for which he will get help from a relative or classificatory. (2) When people hunted game they usually went out in parties, and the kill was shared among them. (3) Digging earth means a journey of anything up to 10 miles round the edge of the forest and into country where nowadays there are strangers, so people find it both safer and more convenient to go in parties, for though they are in no danger of being attacked, their unaccompanied skyward demands combine to give confidence. (4) In a family or clan group, though each individual has his own shamba, he will expect both to help and to be helped by the other members.

Together with the spirit of co-operation is the rule of joint consumption. We have already seen how meat is shared according to definite rules; and among the Dorobo certain other things which are hard to come by must also be shared. The chief of these is tobacco, of which when a man has acquired even a small supply, he is supposed to give some to his father, to his wife's

[illegible]

FLA Durabo FLA

duration of which is in inverse ratio to its toothsomeness and the severity of the cook's hunger.

The Mossi are good to the *Mbaire* and seldom refuse them a share in whatever food is obtainable—be it milk, meat or grain. The *Mbaire* expect this; in fact, many of them seem to look on free rations from the Mossi as their right. The reason for this is stated to be that the *Mbaire* helped the Mossi on many occasions in the past (particularly during the great cimbergent epidemic in the early 'nineties) by hunting for them when starvation had overcome the ingrained antipathy of the Mossi to venison. In addition, before the coming of European rule many elephants were killed by the *Mbaire* at the request of the Mossi. Lekito told me of one drive in which he and about thirty *Mbaire* were engaged during which sixteen elephants were killed.

When a *Mbaire* obtained cattle he used, unless restrained by his more prudent friends, to slaughter and eat them in the shortest possible time. Up to quite recently, a beast was valued by the *Mbaire* only for the amount of meat it was capable of providing, but nowadays a few of them are beginning to herd cattle in a small way and some even live as Mossi. It is interesting to note that many of the older generation, particularly the women, profess an aversion to having cattle in the vicinity of their own dwelling- or sleeping-places.

A few *Mbaire* till the land, but in a half-hearted way. They are extremely improvident and prefer to risk almost inevitable famine rather than to exert themselves in cultivating grain. They never expect their women to work in such small plantations as they may have. A *Mbaire* will cheerfully tramp the bush for a week or more, picking up a most precarious subsistence on tubers and roots, and will consider himself well repaid if he returns with a few pounds of honey. He will be horrified at the idea of putting in one hour's work each day on a mealie patch for the same length of time.

In the bush, very little in the way of food comes amiss to the *Mbaire*. Elephant is reported as a delicacy and would be eaten wholesale only under the most exceptional circumstances. If meat and honey are unobtainable, the *Mbaire* has at his command an extensive

[illegible] Bwendat (euphorbia candelabrum) : honey-hamula.
Bhwat : honey-hamula.
Chwanjwat or Tchwalat (aloe, also chrysophyllum) : fire-wood.
Dzyamlak : fire-wood.
Cwrwat (fibre sp.) : fire-sticks.
Tlat (palm, juniperus procera) : fire-sticks.

(B) Plant materials. The following trees and plants provide materials for food, salt, medicines, and utensils*:

[illegible] Gwalat (dry grass) : binder for making fire with fire-sticks.
† Fajiwarwat : fibre for baskets.
Gwalat (phoenix reclinata palm) : fibre for baskets.
† Fitwat : medicine.
† Gjwalo : medicine.
Bwendat : medicine.
Lajwajwat : medicine.
Gbalwat : medicine.
Gdalwat : medicine.
Fiwat (anthaia sp.) : medicine.
Fajwajwat (cynotis lanigrifolia) : salt.
Gwajwat : salt.
Bwinwat or Bwina (kigelia aethiopica) : making honey-wine.

(C) Horse and animal products. These include :

† Bwalwa : food, clothing.
† Lwalwajo : food, clothing, bags, quivers.
Fajwat : bow-strings.
Fwalbwa : gourds.
† Bwanu : food, wine ; ritual purposes.
Bwat's fat : ritual purposes.
Fwalo : bride-payment ; ritual purposes.
Cwtlo : bride-payment ; milk ; dung ; hides.
Bwak-bwak : bells for bwanu.

The basket most commonly made by the Dwoho is the small bowl-shape, about 4 inches deep and 6 ½ inches wide at the top. This kind of basket is used a great deal by the Fwoho themselves, and is also a frequent article of sale or exchange to the Fwoli. Unlike Bwajwanli Fwoli, "we make baskets for the Fwoli", as an old woman said, Dwoho women make baskets when they have nothing preferable to do, just as European women knit. The materials used are fibre from the outside of the wood palm, which is split into thin strips, and bark from a plant called kajwanwat which is good for making the weft of splitting the wood fibre, preparing a certain length and tying it off as the

* Things marked with a dagger † are used in the preparation of objects given to the Fwoli in exchange for their products.

[illegible]

/235 cont./

231 Then a man climbs up to the beehive, fastens it to a rope, unhooks it, and very slowly lowers it to the ground, so that through the continuing effect of the smoke the bees will also be driven out of the combs or stupefied in them. It is obvious that through this the honey must become very dirty, and, in fact, it tastes strongly of smoke and contains a large number of dead bees and larvae. No other method of driving the bees out is possible, however, and since they are extremely vicious and the people, only scantily clad, expose such large areas for their stings, the honey gatherers have to be enveloped in a thick cloud of smoke for their own protection. I was able to observe the viciousness of the native bees several times. It is by no means rare that a swarm will attack a caravan and sting some of the porters and donkeys into unconsciousness, the latter even to death. Tobacco smoke in particular incites them to attack, but they also seem to dislike loud singing and shouting.

In extracting the honey, one leaves about a quarter of it in each comb so that the bees will not abandon the hive. The extracted honey is packed into leather bags or wooden pots and thus stored. The capture of wild bees is unknown. Where such are found in a hollow tree, one hangs in the vicinity an empty beehive that has previously been smeared on the inside with the extraordinarily aromatic honey of a Melipona species (subspecies Trigona) (1)

1. Identified by Herr Dr. Enderlein from samples sent to the Museum für Naturkunde /Museum of Natural Science/, Berlin.

232 knows as ol mafu. In order to be able to extract the honey of wild bees from hollow trees, one drives them out by holding aloft a burning branch with which one climbs to the hole.

In the camp one sees the men either squatting about dully or busy with carving, such as the beehives just mentioned, or with making bows, arrows, and clubs. The stick intended for the making of a bow (Fig. 65) [illegible] of hornwood already [illegible] of these sticks, and their completed counterparts. After it has been rubbed

1: Huntingford E-4, 5 (1938-1939) 1953 FLA Dorobo FLA

Means by which the Dorobo can acquire stock are: (1) By bridewealth: when a Nandi marries a Dorobo girl, her father gets the normal Nandi payment of one cow, one ox, and a varying number of goats. (When a Dorobo man marries a Nandi girl he has to find somehow the same amount of cattle.) (2) By gift exchange: a Nandi makes friends with a Dorobo, mainly to get honey, and after the first step towards friendship has been taken, the Dorobo gives him some. Later the Nandi gives a goat, and the way is then paved for the exchange of cattle. This exchange is independent of the honey, which is given by the Dorobo from time to time. This process of acquiring cattle is of course a form of payment, but it is purchase under the peculiar conditions of forming a friendship by a previous exchange of gifts, for the Nandi do not readily part with their cattle, and it is necessary to lead up to the final stage by a preparatory exchange of other things. So far the Nandi have been willing to exchange male stock only in this way; to get cows the Dorobo have had to rely on bridewealth. (3) The Nandi will sell goats for cash, but not (at least up to 1938) cattle. The Dorobo do not seem to want sheep; they had none in 1938, nor when I first knew them in 1927.

Inheritance

The general rule is that when a man dies, his goods are kept by his wife for handing over to his children if they are small, or they pass straight to them if grown up. When a man has neither wife nor children, his heirs are his brothers, his father's brothers' sons, or his mother's brothers' sons. Women do not inherit stock. Land rights in the forest pass to the eldest son, or to a brother, or to one of the relatives termed *murokor* (see below, p. 63). Weapons are left to a brother, to a *murokor*, or to a circumcisor. Dogs are left to sons, or else to a brother or *murokor*. Goats are divided proportionately between sons, or pass to a brother or *murokor*. The proportions is roughly as follows, assuming that a man left seven goats and three sons: to eldest son, three; to second son, two; to youngest son, one; to his wife, one, this and its offspring going eventually to the youngest son. The theoretical division of cattle is approximately thus: to eldest son, two; to other sons, one each; to wife, one, which reverts to the youngest son.

Division of Labour

Everything connected with hunting, bees, and weapons is done by men; domestic work by women. The main occupations are divided thus:

Men	Women
Making bee-hives	Building houses
Hunting	Collecting vegetable food
Trapping	Cooking food and beverages
Fetching honey up to work	Looking after small children
Making honey-beer	Looking after girls
Collecting honey	Looking after cows and calves
Making weapons	Making baskets
Looking after the flocks	Preparing skins
Looking after cattle	Making clothing, etc.
Looking after girls	Care of the children
Looking after calves	Circumcision (for women)

Children of both sexes help in tending and herding stock; girls help with the house work and milking, though boys are allowed to milk till they are circumcised. The division is inherently arbitrary with regard to the first nine such activities; but with the last three there is some overlapping, and the essential domestic work and cultivation are often done by men, especially when they are unmarried or live quite alone.

1:Huntingford E-4, 5 (1938-1939) 1953 FLÁ Dorobo FLÁ

412 411 [437] 378 and lying about on the farms. The only weapon is the bow, *keyogda*, which the Dorobo make themselves from the *kwisel* tree (*Grewia* sp.); it is about 3 ft. long, and the bowstring, *tuet*, is made from gut of the giant pig, *bomdo*. Arrow-shafts are made from the *kwenandet* and *mamsis* trees, or from bamboo, *amniyat*; arrow-heads are bought from the Nandi, and are of the Nandi pattern. Arrows are carried in quivers made of hide. Arrow-poison is made from the *Acokanthera* (*arrowtoxicum*) *Schimperi*.

Baskets

415 [462] [524] 385 Making baskets, *kwoyet*, is a common occupation of Dorobo women. They are made from fibre of the *phoenix reclinata* palm, *sisiet*, and sewn with bast made from a plant called *tapwanet*. The technique is a spiral foundation with a flat then gradually spreading coil, of the simple over-seven type and bee-stop variety, the stitches being spaced out and not close together.

Miscellaneous

[317] [462] [524] [385] 415 [415] Salt used to be made from the ashes of the plant *tapwanet* (*acalia integrifolia*). Red and white earth is found near Timboroa on the east of the Dorobo country, and men go in parties of four or five to dig it, carrying home the earth in large leather bags, mainly in order to sell it to the Nandi who, in 1938, gave them 2s. a bag. Red earth, *ewokwai*, is mixed with fat or ointment and for rubbing on the body; white earth, *ewoiniet*, has magico-religious uses. For carrying a number of small objects a carrying-net called *kibanket* is used; it is made of a pair of oval rims 2 ft. 6 ins. long with pieces of lions stretched across them, somewhat resembling a pair of lawn-tennis rackets. These are sometimes used by the Nandi.

Beliefs and Customs

Religion

196 *Asista*, the sun, is recognized as a being that can supply or withhold the needs of people: *Asis, ejejyon pomyek*, "Asis, fill us with meat," is a common prayer. Some say that *Asista* the moon is his sister, others that she is his mother. Besides *Asis*, it is believed that there is a being called *Set*, the thunder, who produces rain, and "the rainbow is his arm which draws up water for him." The Dorobo also believe in spirits, good and bad, both of which are called *emanito*, a word which includes the *mik* (ancestral spirits) and *emamelumik* (evil spirits) of the Nandi. The ancestral spirits have the same significance and functions as those of the Nandi, and though they punish the living for doing evil, they are otherwise friendly and visit the living, travelling in the bodies of snakes, both to see their people and to get food in the form of *kibosiet* (honey and water); spirit-snakes should not be killed.

195 *Divination*

[367] [524] [385] [385] The Dorobo appear to have no diviners of their own, and when they have recourse to divination, as in cases of illness or witchcraft, they go to Nandi diviners of the type called *sotonet*, by whom they are charged a small fee. The people who prepare healing medicines from trees and plants. Although the Dorobo have a reputation among other tribes as powerful rain-makers, they themselves say that they have no rain-makers, which is probably true.

Death and Burial

[364] Very old men and women are buried in narrow holes about 5 ft. deep in which the bodies are laid full length wearing their clothes and their arms and legs tied. Children about a month or *mokwanet* (*Sterculia* sp.) on the grave and let it grow. Other people are laid out for the funeral, their arms on the right side with

3:Huntingford E-5 (1921-1928)1929 FLA Dorobo FLA

prepare food and wait upon the men, themselves eating when the men have finished. At the present day the Dorobo are taking to eating cleaning grain, which is crushed on grindstones (*lotto*, N.) and made into a sort of porridge; and milk, which they obtain from Nandi, if there are any near them. Beer is made from honey, and is called *kipkelinik* (N.). Tobacco (*nemutet*, N.; or *chepkwekitit*,[1] N.) is bought from the Nandi, and is taken by men, and occasionally by women. It is either chewed (*wit*, N.) or smoked in Kavirondo pipes (*sotheik-ap-nemutet*, or *kwaloik*, N.), which are also obtained from the Nandi. The men carry tobacco in cylindrical leaves called *kipyemut* (N. *kipyut*) (Text-fig. 22), made from *semiyot* (bamboo), with skin coverings for the ends, to which are attached thin leather thongs, by which the box is slung round the neck.[2]

Agriculture and Stock.

Formerly the Dorobo possessed no stock, nor did they till the ground. During the last quarter of a century or so a few of those living on the edge of the forest have taken to cultivating small plantations (*imbaret*, N.), in which they grow cleaning grain (*ellocich*[3], or *punich*; N. *pilli*) only. A few possess, at the present day, one or two cows; others have a few goats and sheep; no one has more than 5 to 10 head. The only animals they possess in numbers are dogs.

Dress and Ornaments.

(i) *Males.*—Boys wear skins of antelopes and monkeys (*aburiat*; N. *tapuriat*). Warriors wear skin garments of dukker (*ngomuengo*,[4] N.) called *almotiot*; they wear leg-bells attached to a leather band (*kapitilio*,[4] pl. *mpitilokinik*) on the ankles. Nowadays some wear pieces of cotton-cloth (*angot*, N.) dyed brown.[4] Old men wear hush-hush skins (*aburiat*) with the fur left on. Caps (*ngoroiot*[3]) are worn, of blue duiker skin with the fur left on, by old men, and of cotton-cloth by warriors. Belts (*nakwoit*[3]) of leather are worn by old men, and of beads by boys and warriors. Necklaces of *chainin* (*pirimdo*, N.) or iron wire (*poingoi*, N.) are worn; also various kinds of iron ear-rings (*akimwariot*) and *kwenkwein* (Text-figs. 13-17); N. *kwenkwiniot*) are worn by warriors and elders.

(ii) *Females.*—The dress of the women and girls is very similar to that of Nandi women. They wear skirts (*chepkenyeit*; N. *chepkenyit*) and upper garments (*kaldoi*, N.), both of tanned leather, with the fur removed, in the same manner as the Nandi women. Their ornaments consist of iron wire armlets and leglets (*mulkwenkwik* and *kurok*, N.), and wire necklaces (*poingoi*, pl. *ampoingoiek*, N.). Married women wear

[1] *Chepkwekitit* means "small" in Nandi.

[2] Pieces are similar to the Nandi tobacco-boxes, from which indeed they are probably borrowed.

[3] As in the Nandi, from whom doubtless the custom spread to the Dorobo.

3:Huntingord E-5 (1921-1928)1929 FL6 Dorobo FL6

411 *Bows.*—These are made from the kwiet (N.) tree, and average 5 ft. 1 in. in length. The string(laat, N.), which is made from the entrails of the giant pig (nemda, N.), is tied to the bow (Text-fig. 4).

[331] [334] *Arrows.*—The iron heads (*kipukdyat*) are bought from the Nandi, and are usually of the Nandi shapes called chapilichgiet (Text-fig. 5) and kipchapet (Text-fig. 6) (H.N. Figs. 33, 34). They are from 2½ ins. to 4 ins. long. They are always tanged, and are inserted in a shimade in the arrow-shaft (Text-fig. 9) and bound with fibre or skin binding (simde). The shafts are made of the sawiyat (bamboo), mamita, and kwemamiet trees, and are of an average length of 2 ft. There are three feathers (kwerik, N.), which are split and trimmed, and fastened to the shaft by a spirally-bound cord (Text-fig. 8). The shaft immediately above the feathers is bound with skin simdin; the cock (sesin) is shouldered, and bound over the shoulder with a skin simdin. The nock of the feathers is 2 ins. to 2½ ins. Arrows are kept in a quiver (Text-fig. 10)*sawiet* N.; *sebulgiet*) of leather, and about 2 ft. 3½ ins. long, with a leather cord a sling for carrying it round the body. (For the position assumed by Dorobos shooting with the bow, see H.N., Pl. VII.)

412 *Knives.*—The iron blades are bought from the Nandi. They vary in length from 9 ins. to 12 ins and are about 1½ ins. wide. The handles are about 5 ins. long, of wood, with spirals cut in them, and covered with skin, which is pressed into the marks so that they show through the skin. The knives are carried in leather sheaths (*chokut*, N.) which are attached to leather belts (*ngoiwet*, N.) (Text-fig. 3).

(b) Leather.

201 Skins are dried and trimmed, and furnish, besides articles of dress and bedding, quivers, clothe and bags. The ordinary type of bag is called *sumbuet*.

415 It is used for various purposes, including carrying honey; for honey-bags, the fur is removed. Bags for carrying other things are made of antelope skin (e.g. *kipandet*, blue duiker) with a fur left on, and flaps to shut them, which are fastened by a

[210] skin cord tied round the bag (Text-fig. 10). They are slung from the shoulders by a skin cord. Smallbags are about 7 ins. by 6½ ins.; others are larger.

(c) Baskets (*kwogut*, pl. *kwogunik* (N.)).

[205] There are mainly the women. They resemble Nandi baskets of the same name. The upright sticks the baskets are called *tegerik*; the cross straws, *sosik* (N. = *Plectronia rudis* gat). The bottoms are flat and are made of skin, which is sewn to the sides. Sometimes a handle of skin. The average depth of the baskets is 8 ins., width at top 1 ins. (Text-fig. 11).

(d) Miscellaneous.

410 For carrying things in the forest, a contraption called *kiswaiet* (N.) is used (Text-fig. 12). It consists of two oval objects somewhat like tennis rackets fastened

262 [206] eastern part of the area and towards Londiani. Monkeys and pigs are found both in and outside the forest; leopards live on the edge, and lions are still occasionally met with in the open country near the forest. Antelopes are still found, but they are not so plentiful as they used to be.

Honey is produced in honey-barrels. This constitutes a special department of Dorobo life, and will be described in §3 below.

Wild vegetable foods which grow in and round the forest are eaten both cooked and raw as relishes or additions to the staple diet of meat and cereals; the task of collecting vegetable food is usually performed by the women. Recorded wild foods eaten are:

[222] [462] Fruit of the *sinik*, which are something like white currants, dried in the sun and eaten raw.
Fruit of the plant *mumoyat*, *ximenia rigidia*.
Fruit of the *lemiyat*, *ximenia americana*.
Fruit of the *sesewiet*, *Musa ensete*, the wild banana.
Leaves of the *sinet*, *girardinia condensata*, nettle.
Nap of the wild banana, eaten in place of what the Nandi call *kimiet* or 'porridge'.

222 Banana nap is collected by sticking a flat piece of wood into an incision made in the stem of the tree; a receptacle is hung on the end of the wood and left there for the nap to drip into it. The fruit of the wild banana (a very 252 poor substitute for the cultivated kind) is placed on the drying tray (*meiut*) over the fire till it is roasted by the heat, and is then broken up with two stones and chewed; it is very hard. Tobacco is bought from the Nandi.

222 192 Before trade salt was obtainable through the Nandi, the Dorobo made 263 a substitute from the leaves of the *sapungat* bush (*zanthia integrifolia*), or [257] of the *sesungat* tree. Leaves were burned, and the ashes collected in a [71] suitable receptacle, a little water was poured on them and mixed, and the resulting liquid was added to food as needed. Some of the Bantu Kavirondo used to make a similar substitute for salt.

273 Intoxicating drink is chiefly made of honey, though now a little *chemtoo* beer is made in the Nandi manner. The Dorobo method of making *kipkwonik ne kwonik ap lo*, "honey-wine", is as follows. As a fermenting agent, the seed-pods of the *ratenet* tree (*kigelia aethiopica* or the sausage tree), [124] which may be as much as a foot long and four inches thick, are boiled till quite soft when they are cut into strips and put into the honey to make it ferment. A Dorobo description of the process of making the drink is this:

Kimyor [illegible] *kokpale* [illegible] *ne* [illegible];
[illegible]
[illegible]
[illegible]

4:Huntingford E-5 (1938-1939) 1953 FLA Dorobo FLA

In a settlement or clearing inhabited by several people, meat would be shared in a definite way:

I		II		III
A a man		A a man		A a man
B his father		B his brother		B a clansman
C his brother		C a clansman		C a clansman

A supplies B first, then C if C has no food; but before anybody else is given meat, A must give some to his father or father-in-law if they are within reach. Vegetable food, being accessible to all, is not shared.

There is a clear division of essential work between the sexes. Everything connected with hunting, bees, and weapons is done by men; women do the domestic work and other things of that nature. The more important normal occupations are divided thus:

Men:	Women:
1. Making fire.	Building houses.
2. Hunting.	Collecting vegetable food.
3. Trapping.	Getting water and firewood.
4. Putting meat on to cook.	Looking after meat cooking.
5. Making honey-barrels.	Collecting other foods.
6. Collecting honey.	Milking (if cattle are owned).
7. Making weapons.	Making baskets.
8. Exchange with the Kamâ.	Preparing skins.
9. Getting coloured earth.	Making clothes, etc.
10. Cutting wood for uses other than firewood and building.	Care of the children.
11. Making fences.	Sweeping huts, etc.
12. Preliminary heavy work in the shamba*.	Cultivation — all stages.

Children of both sexes help in weeding and looking livestock; girls help with the housework and milking cows, boys with (if) they are circumcised.

So far [illegible] the sex-division is followed strictly with regard to the four nine items of men's work; in the last three there is a certain amount of overlapping. Of women's work, basket-making, the preparation of skins, and making clothes are strictly confined to women, but the essential household work of preparing and cooking food, sweeping, and cultivation is often done by men, especially when they live alone in the state of nature; men [illegible] Stone-building, including cutting and carrying the wood and roof-material, is all done by women, unless a man is living alone, or has to build a new hut at a time when his wife is for some reason away. [illegible] Mista, for instance, had to build a new hut when his wife was ill, and in consequence had to d[illegible]

* Applied to a piece of cultivated ground, and widely used by Europeans.

4:Huntingford E-S (1938-1939) 1953 FLA Dorobo FLA

it himself; but this was regarded as unusual in the case of a married man with a comparatively young wife (his wife Cepkomoron was at that time about 30).

While the areas within the hords are interdependent, the horde as a whole is dependent on the outside world as represented by the Nandi. Not only do some Dorobo now actually live with Nandi, but they depend on them entirely for all their articles of iron, without which they cannot hunt. Gradually, however, witchcraft is increasing. Sometimes unattached old men like Arap Cepenkes, who was about 70 at the time of my visit, live in huts occupied by Nandi: Arap Cepenkes himself was then living with an old woman at Kipkoreon, sharing her hut, and growing a little elevusine at one end of her shamba, but merely as a lodger, having no sexual relations with her, for which both were too old. As he was a poor old man, she fed him and looked after him for nothing. This is true symbiosis, as the late Dr. Malinowski called it, and the principle is greatly extended by the Dorobo. For, whatever may be the collective attitude of Nandi to Dorobo, and of Dorobo to Nandi, the Dorobo depend on the Nandi for certain essentials, and the Nandi look to the Dorobo for certain things which they can get most easily from them. To the Dorobo, the Nandi, in the shape of the Nandi blacksmith, is indispensible, and the good will of the Nandi people is equally essential if they are to make use of his services.

The Dorobo do not specialize. Every man learns to make all the things he needs for bee-keeping and hunting (except those made of iron); every woman learns to make baskets and prepare skins. The raw materials exist close at hand, and may be grouped under 5 heads:

(a) Wood: used for huts, implements, honey-barrels, traps, fuel.
(b) Plant material: used for food, medicine, salt, baskets, and timber.
(c) Skins and other animal products: used for clothing, bags, rools, etc.; dung, used to a limited extent for plastering walls.
(d) Earth and stone: coloured earth for painting; granite for grindstones; earth for plastering walls.

(e) Wood. The following trees are used for making weapons, utensils, etc.:
Kaisut (*ndiva* sp.): bows; house-building; honey-barrels.
Waasis: arrow-shafts; firewood.
Kwonsosiit: arrow-shafts.
Asaiyat (*kaatiwa*): arrow-shafts; intermediate used as water jars.
Kitoyonot: traps.
Kimaliwat (*cangiwita olidia*): traps.
Kolot (*senecio kilimanjari*): arrow-poison.
Lopolwat (*Ficus* sp.): house-building; honey-barrels.
Mipsiyoyot (*ficus* sp.): house-building; honey-barrels.
Olarabis: house-building; honey-barrels; fire-wood.
Sasaroit (*wild banana, musa ensete*): house-building; honey-barrels.
Tinetiwat: honey-barrels; fire-wood.
Tirwet (*Ficus*): traps; honey-barrels; house-building; any purpose for which rope is required.

Huntingford R-S (1938-1939) 1953 PLA Dorobo PLA

waste it, i.e. as the bone and gets thin, a new end is shaved under the binding; the best is kept handy in a bag. The technique is a spiral foundation with a flat, then gradually ascending coil, of the simple over-over type, and two-way variety, the stitches being spaced out and not close together. The base of the basket is formed of six fibre coils, sewn together with bast. A hole is made with the needle, and the bast is pushed through it. At frequent intervals the fibre and the bast are moistened with the lips. After the first six coils, a slight rise is made: as each coil makes a complete circle it is slightly raised in order to make the bend between the base and the sides. When a new piece of bast is needed it is shaved right through the hole, leaving about $\frac{1}{2}$ to 1 inch on the other side, and is sewn through as before. The basket maker works with lengths of bast of 6 to 12 inches. The fibre coil is of about the thickness of a pencil, and this must be maintained. When the length of fibre is reduced to about 2 ft. it begins to get thin, and some new strips must be added by shaving off a further length. The structure of the basket is then, in effect, a continuous coil of compressed fibre, each line of coil tied to the next by stitches of bast. Sometimes the base is made of a circular piece of leather, to which the first coil is sewn, the rest of the procedure being the same as for the all-fibre basket.

The dressing of skins, including those used for exchange, is a simple process, for no chemical agent is applied. The newly flayed skin is tightly pegged out on the ground while it is still wet and left to dry in the sun. When dry, it becomes stiff, and in this state it is rubbed with an iron blade held at an angle of about 30°, the blade being rubbed backwards and forwards till the skin is soft and supple. If it is to be used for a woman's garment or other object in which fur is not needed, both sides are rubbed. Skins are dressed by women. Apart from clothing, the chief objects made of skin are bags, quivers, and parts of tobacco-boxes. The material used for sewing is generally pig-gut. The needle of course has no eye, and the method of sewing is therefore to make a hole with the needle and then push the gut through it. Bags, satchels, etc. are used for many purposes, including the carrying of honey and coloured earth. They are generally made of antelope skin (e.g. Thin dikdik), and unless intended for honey the fur is left on the outside. They are provided with a flap, a strap for fastening and a strap for carrying them from the shoulder. A common size is 7 ins. by 6 $\frac{1}{2}$ ins., but I have seen them as big as 19 ins. by 16 ins. Tobacco-boxes are made from internodes of bamboo, but they have leather covers at each end, and a thin leather strap is sewn to the covers so that the owner can sling the box round his neck.

The system of Dorobo life demands exchange of products with the Kisuaili. The most important of the products they get by exchange is ironwork, other things are pottery, finely tobacco, cured cattle and cattle and a fairly definite, though possibly fluctuating, scale of exchange values has come into existence. In 1939 some of these values were:

1 axe for 1 kaglet of honey
1 arrowhead for a gourd full of honey
3 knives for 1 day's weeding in the Government's shamba.

436 1 bundle of tobacco (about 1 lb.) for 1 light of honey.
1 large earthenware pot for 1 large pregnant antelope skin.
1 small earthenware pot for 1 small pregnant antelope skin.
3 bushels of cereal seed for 1 basket (large).
5/- worth of trade beads for 1 gazed tidal honey.

The hog used as a measure for hony is the smaller size of hoops, measuring 7 or 8 ins. for 6 ½ or 7 ins. The gazed is about 10 ins. long. The large pot stands about 30 ins. high, the well, about 18 ins., and the large antelope skin is usually a bushbuck, the well ever a duiker.

There are no special market places : places of exchange. The Dendo go to the nearest smith or pastor and rear a bargain, returning later with the exchange equivalent to collect the goos. There is no language difficulty in these transactions, for the Dendo language is no more than an easily understood dialect of Kwafi. Getting loose pottery means going into the Reserve, but to get seeds, tobacco or food they need only go to the nearest friendly Kwafi who has what they want or is willing to make the exchange. Sometimes plant materials of medicinal value, i. e. what they think is medicinal value, is substituted for some of the regular exchange articles, but the above list represents the ordinary practice. Who Dendo have money with which to buy what they want instead of exchanging goods, they have the choice of going to the shops at either Naughton to the south, or else at Arowa to the Kwafi Reserve, where there is a subsidiated Indian shops. The men do not like both successfully to go to these places concerned, but occasionally some of the ladies were try to slip away unobserved to Arowa ; they seldom go to Naughton, as it is to the Europeans area.

No human group can exist without any form of co-operation, and even what a man lives alone, as he may farm among the Dendo, he is not because of that not all them or unable to see to the activities of his kith. Within the family people are interdependent, and in the settlement they help each other. The main activities in which gods normally co-operate are four in number : 1. House-building. 2. Planting 3. Digging earth ; 4. Cultivation. (1) Building here is women's work, which case will do if he has no wife, and for which he will get help from a relative or classificon. (2) When people harvest gums they usually work out in pairs, and the kill was shared among them. (3) Digging earth means a journey of anything up to 10 miles round the edge of the forest and into country where [illegible] are strangers, as people [illegible] for fear of being attacked. Here also [illegible] to get in parties, for though they are in the danger of being attacked, their encompassible anyone [illegible] to give assistance. (4) In a family or clan group, though each individual has his own duties, he will expect both to help and to be helped by the other members.

Together with the spirit of co-operation is the rule of joint consumption. We have already seen how meat is shared according to definite rules, and among the Dendo animals other things which are hard to come by must also be shared. The chief of these is tobacco, of which when a man has acquired even a small supply, he is supposed to give some to his fellows, so his wife's

455 the absence of pastoral and agricultural habitations and implements, by their myths, and in fact by everything about them. Today it is true that they are becoming agriculturalists, as the following analysis of their economic activities will show:

		Men:	Trapping game in the forest		
			Making weapons, honey-barrels, etc.	Cultivation of shambas	
			Some: working for wages		
	Family	Women:	Preparing the results of trapping		Both
			Making baskets, skin clothes, etc.	Cultivation of shambas	
			Housework and food collecting		
		Children:	Washing		
			Hunting		
			Housework		
	Men Living Alone:		Trapping	Cultivation of shambas	Both
			Making things		
			Preparing the results of trapping		
			Cooking, housework		

Dundee life therefore converges on subsistence, with a hunting background, and seeks to view as the ultimate achievement. Even though the hunting instinct is still very much alive, and though a great deal of time is now spent on cultivation, there is no doubt that the Dundee (as OGH or Iraqi) had a fundamental unanimity in their beliefs as the ultimate goal.

5. Economic Activities

a) Hunting [1]

Honey is to the Dundee what milk is to the Fiadi. It is sold [illegible] and has a high retail value, in consequence of which certain rules exist to [illegible] honey. Enough for an elder may not touch on the same day that he has eaten honey. Enough for an elder may not smoke. After eating honey, one of the youth must not be left lying on the ground, but must be hidden in the undergrowth. Amos White said, somewhat metaphorically, that the reason for this was "that other people shall not see them and so find or [illegible] honey-barrel". But this is probably not the true reason, which may be either simply respect for the honey, both a food that it involves disagreeability the supply with fat, or else fear of a witch grabbing a spirit on the trees in honey

barrel, so that the smoke goes inside and the bees come out. We then take [B5.]
and what honey he wants, wraps it in the leaves he has brought, and downside,
carefully extinguishing the fire where he has cracked the ground. Though
sometimes the barrels are not more than a few feet from the ground, very
often the process of taking honey means a climb of eighty feet or so with no
help but the extremely ladder already described.

Although honey has great ritual and social value, the milk is the food [79]
it cannot be said that bees take the place of cattle in the daily life of the
people, for they require and receive no care beyond the provision of barrels
and the due observance of the taboos concerning honey, and there is really
no need to know very much about them. But as producers of honey, bees
provide material for food, drink, and ritual, and they are thus of some
importance. Honey, too, is a much-used medium of exchange. Without honey [84]
Dweller life would be poor and empty.

6. Hunting

In the past, hunting was the chief occupation of Dweller men, and [B3.4
though they have had little men, confining their activities to trapping, they [B5.]
have still a "hunting outlook". The conversation of Dweller walking through [B5.]
the forest centers on later turns on the animal life around them, for as we have [B5.]
already noted, they have what the French call *coutin*, which one might almost [B]
render 'affinity', with the beasts of the forest. The sort of talk that goes on
in the forest is something like this example, which I took down after hearing it

A. *Kalak ad Gnark.*
The bear of the mountain.

B. *Ina, ni [blank], [blank] in, [blank] in*
Look, there-is (a) the-hedgehog, it-comes-from over-there, it-goes over-there
Wiwa, a [blank] [blank], [blank]
Good, but not much very, it-has-the-child small

A. *Cook [blank] Gnark, ad [blank]*
(They are) now there animals they-are-in our-forest, I-like (the things)
[blank] [blank]
which-are-of forest

B. *Tagamaana ahiak [blank], [blank] ad [blank] ak Ka*
Let-us-look over-there (on) their-tracks, perhaps there-is the-animal comfort, What
at ne [blank]
do this their-congregation-place?

A. *Ighlu [blank]*
Perhaps the-place-pig

B. *[blank], [blank] [blank], Tagamaana [blank] [blank] ak [blank]*
Yes, I-am there-(at) (it-has) there I-will there-is I-will there-are the-tracks
Ka [blank]
of-the-animals
and-then the-bone

A. *Tagamaana ak [blank]*
Let-us-see where it-escapes-me

...

...

...

[P 141.6]

200-300 ft. in most places. Once the forest is reached, the slope is gradual, ranging from 6,200 ft. to 6,400 ft., through the main river, the Kipanzo, flows through a valley 1,000 ft. deep. The rainfall, taken at Kipalanza farm about two miles from the W. boundary of the forest, averages 50.24 inches over 5 years from 1920 to 1925: the maximum was 76.22 inches in 1927, the minimum 29.41 inches in 1922. In the forest itself the rainfall is undoubtedly higher. The forest is always damp: mists are frequent, and even in the dry weather it is not always quite dry, a condition which is responsible in part for the rather high infant mortality among the Dondo. On the edge of the forest are glades with a fringe of fever trees (*acacia albida*), and between the forest and the farms is a strip of land, included in the Forest Reserve, which is suitable for cultivation and stock-keeping. The year is divided into two seasons, *Mwakiandi*, the dry season from October to March, and *Awa*, the wet season, from April to September. These determine both the new shadowcane hunting activities, and the increasing agricultural activities.

B. Economic Activities.

The economic life of the Dondo may be divided into two phases: (1) the old hunting existence, which began to disappear about 1920 when the Government started seriously to restrict their forest life, and (2) the present trapping-agricultural life in which cultivation is becoming of increased importance.

The economic group is either the elementary family or the domestic family (or, the extended family). Sexual division of work overlaps to some extent, but most of the work outside the settlement is done by men (hunting, trapping, woodcutting, and intercourse with the outside world), while the women do the work inside the settlement, except that they collect all the vegetable food from the forest. Agricultural work is performed by both sexes. Things peculiar to women are: the making of clothes, leather work, and basketry; to men: making weapons and other utensils, digging coloured earth, and getting meat on the fire to cook (though the women look after it once it is on the fire).

he found hunting on his own, though he would be liable to pay blood-cattle for homicide.

As for trapping, it is said that nobody steals meat from traps because their bellies would swell to a great size if they ate stolen meat. Public opinion, too, is strongly against such a mean crime, and is of itself a powerful deterrent. Nowadays trapping is the chief source of meat, and the common practice is for a man to set three or four traps at a time in different places, and to visit them every two days or so to see if anything has been caught.

Monkeys and hyrax[1] are killed for their meat and skins; pig provide meat and gut for bow-strings.

2. Agriculture.[2]

The Dorobo are in process of changing from a hunting to an agricultural existence, from the uncertain hunting economy to the more certain one of agriculture; and the same economic pressure which has forced them to till the soil is now encouraging a desire for cattle, which are being slowly and laboriously acquired. This leads in turn to a more self-supporting state, with less dependence on the Nandi for grain crops; and agricultural techniques, both in tillage and stock, are being learnt from the Nandi and from Europeans.

Both sexes work in the cultivated plots (*tukuny*), and are helped by children, who weed the crops, herd the stock, and milk the cows. The crops grown at present are eleusine (*eleusine coracana*, called *wimbi* in Swahili) and maize; millet and tobacco are still bought from the Nandi, from whom the Dorobo also get eleusine and maize seed when necessary. Unlike the distribution of the forest into hunting areas, people cultivate the ground close to their own houses, and a group

[1] The hyrax killed are:
Kiguekut, blue duiker (*cephalophus monticola*)
Mokoiot, red duiker (*c. ignita chapini*)
Kwemosit, bush buck (*tragelaphus scriptus*)
Sochotet, reed buck
Kimyakit, oribi
Kipsongorit, water-buck (*cobus ellipsiprymnus*).

[2] I prefer the term 'agriculture' to 'horticulture,' for the latter implies mere cultivation, with no livestock, and in East Africa agriculture is almost always practised in conjunction with stock-rearing, even if only on a small scale.

[illegible]

[redacted]

a blowpipe, but this was regarded as unusual in the case of a married man with a comparatively young wife (his wife Cyphonoonoo was at that time about 30).

While the sexes within the family are interdependent, the family as a whole is dependent on the outside world as represented by the Kisoiti. Not only do some Dorobo men actively live with Kisoiti, but they depend as a community for all their articles of iron, without which they cannot exist. Axes, knives, spokeshaves for bowmaking, hatchets and even the long spears, which was about 10 at the time of my visit, have to have originated by Kisoiti. Arap Cyperibo himself may then living with an old woman at Kiptarakwa, sharing her hut, and growing a little tobacco at one end of her plantation, but mainly as a lodger, having no sexual relations with her, for which both were too old. By he was a poor old man, she fed him and looked after him for nothing. This is true symbiosis, as the late Dr. Malinowski called it, and the principle is greatly extended by the Dorobo. For, whatever may be the collective attitude of Kisoiti to Dorobo, and of Dorobo to Kisoiti, the Dorobo depend on the Kisoiti for certain necessities, and the Kisoiti look to the Dorobo for certain things which they can get more easily from them. To the Dorobo, the Kisoiti, in the stage of the Kisoiti development, is quite essential, and the good will of the Kisoiti people is equally essential if they are to make use of his services.

The Dorobo do not specialize. Every man learns to make all the things he needs for hut-building and hunting (except those made of iron), every woman learns to make baskets and pinpoint dishes. The raw materials come also at hand, and may be grouped under 3 heads:

(1) Wood: used for many implements, heavy-barrels, traps, hut.
(2) Plant material: used for food, medicine, soft, baskets, and cloths.
(3) Skins and other animal products: used for clothing, bags, mats, etc.; dung, used to a limited extent for plastering walls.
(4) Earth and stone: unburnt earth for pointing, granite for grindstones; earth for plastering walls.

(1) Wood. The following trees are used for making weapons, utensils, etc.:
Kararit (*Aloe* sp.): bows, heavy-hatchets, heavy-barrels.
Kiwanda: arrow-shafts, skewers.
Kimwaindet: arrow-shafts.
Kwoiyan (*Sterculia*): arrow-shafts, snuff-boxes used as water jars.
Kimoiyoni: traps.
Kimoiben (*Juniperus*): traps.
Kiptai (*Leonotis*): arrow-poison.
Kipkelion (*Maesopsis* sp.): bows, hatchets, heavy-barrels.
Kipkenyet (*Olea* sp.): bows, hatchets, heavy-barrels.
Kimondo: bows, hatchets, heavy-barrels, skin-scraper.
Kwoiyo (*Ficus*): bows, heavy-barrels, bows, hatchets, heavy-barrels.
Kwoiben: heavy-barrels, skin-scraper.
Kwoi (*Ficus*): traps, heavy-barrels, bows, hatchets, any purpose for which rope is required.

This area is a gazetted Forest Reserve, and the official boundary, marked by a broad line where the bush and trees have been cut, runs some distance outside the actual area of trees; this boundary line is kept clear by the Forest Department, for it acts to some measure as a firebreak. It is also the upper boundary of a belt of European farms which occupy the land between the forest and the Tribal Reserve. No less strip of open ground between the trees and the farms most of the Dondo save live, and it is on these farms that some of them work.[1]

The forest itself is bordered in many places by a narrow belt of exotic trees (exotic refuses, the Eucalyptus rhombifolia), so as allow the men to eastern Kenya. Between the trees and the forest are glades (areas affording open spaces concealed from the outside world). The forest is evergreen "high forest", the trees many of them 100 ft. and more in height, growing close together so that the branches and foliage which are mostly at the top form a crown or canopy that shades the ground from the sun. All ground over the open between the trees is largely covered with thick, tough undergrowth and giant thistles, up to a height of more than six feet, which make it impossible to travel except along a path. The rainfall is heavy and mists are frequent. In the dry months there is occasional heat-haze in open ground. In a month of the dense tree cover, the forest is always wet during the rains and in the dry months some exotic drops before the damp disappears.

From any commercial point of view the forest is perhaps not of very exciting value, but it is that dense natural cover and an ideal home for the Dondo who do not judge trees by their value as merchantable timber. Of the many kinds of tree in the forest, the following have been described:

Cassia, Kiswa sp.	Brachylaena rugosa, mukinduri
Podocarpus usambarensis, kihingaro	Aphloia theiformis sp.
Ekebergia, Kiha sp.	Teclea, mwau nyeusi
Cedrela odorata, mukuruwe	Croton, mpira kibiyumbiyu
Strombosia, pelgopetala, mwageleza	Croton, mpira mbaya
Podocarpus, Kihiyo sp.	Ficus, Kiwa sp.
Albizzia, Kiha sp.	Ficus, mnukwa, mkuyu
Cassia, Kiswa sp.	Ficus, mkuyu
Podocarpus, Kihiyo sp.	

When the Dondo lived in the forest, their homesteads were modified to survive and hardly discernible paths through the undergrowth, remnants some of these paths are still used as approaches to forest beasts and game traps. The forest can be traversed by two roads only, one running from Rabai to Kaloleni, the other parallel to it from Mazeras to Kaloleni. From today the only through routes people going to Kaloleni have to go along either the northern or the southern edge of the forest.

[1] The forest was extensively used and, from some years ago, occupied and [illegible] as land is scarce and land values high. Many of the farmers are [illegible] of Mijikenda origin.

[illegible] Kilbeachaglaird region that Secretive P1As obtained as part of Secretive survival. Kilbeachaglaird did not originate Kilbeachaglaird economies that began many Secretive P1A generations ago. Kilbeachaglaird economies developed. (Figure xx shows Kilbeachaglaird.)

Secretive small-scale are fooled on their they use for spite: they are enabled to the river to preserve very their stitching to them, and then when they have become quite soft, they are put in the sun to dry. The dried strips are each put into a pot containing honey and nothing else, to make it thicker, i.e. to ferment it, and some water is added. The mixture is put in the hot to ferment. It is left for several days till it is ready and use for breads. There are always [illegible] called kibeach, or honey and water, is also a favourite of the Secretive. It is not intoxicating and is made simpler to prepare than honey wine, being simply honey and water mixed together, without the addition of dried fruits, and drunk the same day without any fermentation.

In the old days, the Secretive way they were seldom absolutely without food, for there would generally be got with either bee or hog and either a deer or [illegible] whose presence would help the family until food to could usually get enough to live there. This is probably true, for in those days game was plentiful enough, and there were no Europeans to restrict their hunting activities. Nowadays, when hunting is normally not allowed in this area they have trapping. There is an uncertainty about the food supply which was the introduction of agriculture and the increase of Europeans living there and altogether unless. It was easy to get subsidy with the trapping. Europeans followers, as "harmful wages". In Kilbeach for this, and the only way to a small one, or much damaged by weevils. Kilbeach although are member of a family they were for a single member on a neighbouring farm and get a daily ration of 5 lbs. of maize meal where he works, he has to find one who himself for his own family and garbage others. For instance, a man of the Kilbeachaglaird Kilbeach Kilbeach Kilbeach but to look his wife, his child, his sisters and his mother, as well as himself. Kilbeach Kilbeach, one of the neighbours who also worked as a boy, had a house to look his mother Kilbeach Kilbeach, his wife, his four children, and his mother. They possess of land 1 day to so go to in his use a small crop and his produce of his crops and Kilbeach Kilbeach other Kilbeach among right people to a bad season. Kilbeachaglaird considered as for a possible by the principle of Kilbeach, and a man who has built his own other Kilbeach his own family work, and then Kilbeach to look various others a visit to Kilbeach Kilbeach as we have just seen, the hut to look given people Kilbeach himself in trees, but in his use his normal use of Kilbeach Kilbeach may find a new provided more for his wife and children for his parents, and sometimes his wife's parents also his old people as Kilbeach Kilbeach as also Kilbeach and used to him was give Kilbeach. If successful Kilbeach also should his old wife Kilbeach who never with him and more seriously. The distribution of meat may Kilbeach as follows:

Chief — 1/4 Kilbeach family
1/4 Kilbeach parents
1/4 Kilbeach parents
1/4 Kilbeach followers

father (if he lives nearby), to his brothers, and lastly, if there is any wine, to his neighbours in the settlement – so that a man who gets a present of wine or of French tobacco does not keep much of it for himself.

Drink, mainly in the form of honey-wine, is prepared not as much for private consumption as for social gatherings. It is used to welcome neighbour performances, and as part of the bride-payment. When a man is visited by a friend or two, he gives them honey-wine; when there is a slightly larger crowd, honey-wine is drunk; and when even still more men turn up a wedding or a wedding they drink honey-wine. It is thus an indispensable part of Swahili social life. When a man wants to relax, he has done and gone to sleep, but the amusement is composed of social gatherings. Visiting ceremonials, and also events in fact provide him with the entertainment, and conversation and gossip seem to take the place of games and dances. I saw no sign whatever of the game called bawadi by the Swahili, which is played with seeds or pits, like to ludo to the ground or to a board, and never heard it mentioned. I neither saw nor heard of a dance, and I never once heard a Swahili or other one singing.

The principal standard of wealth is really a man's skill as trapper, hunter, and bee-keeper. But the products of this skill are perishable, and formerly the only way in which tangible wealth could be accumulated was in the form of weapons, honey-barrels, and dogs. Now that the old hunting conditions have gone, it is becoming possible for a man to accumulate wealth to a very limited extent in cattle or goats, which he can get by purchase, gift-exchange, or through bride-payments. The use of money has just become familiar, and a certain number of Swahili now wages, but except for one or two who have joined the Police, wages are not high, and the average is little over 7 to 10 shillings a month. So far the Swahili have had little inducement to work for wages, except that by signing on as apprentice for a small wage they can acquire a temporary right to live on what they think were luxuries. Beyond the fact that money enables them to buy a little extra food, we find at present it does little or nothing to them, and they have not yet attained the enough into the investment stage for it to be anything more than a small supplement to their traditional way of living. It is all that they can do to maintain themselves, let alone accumulate reserves or surplus wealth.

The investment stage which the Swahili had reached by 1939 is that from hunting to agriculture, with at the same time a strong desire to acquire cattle. It is sometimes suggested that hunting peoples like the Swahili are really agriculturalists or pastoralists who have had to give up their real callings as pastoral way of life and take to hunting. This may be true of some tribes, such as the Kipsigis Dorobo (a party of Kipsigis who are mainly cultivators and fugitives from various tribes; this is quite clearly not true of the real Swahili[1], who have only been the subject of this paper, who are unmistakably non-pastoral and non-agricultural. Their basic hunting tendency is shown by their character and behaviour, by their hunting techniques and skill, by

[1] In my opinion is [illegible] p. 204.

father (if he lives nearby), to his brothers and family. If there is any area, to his relatives in the settlement, or that a man who gets a present or an act of friendly relations does not keep wealth at it for himself.

Stock, mainly in the form of beasts-sheep, is prepared not as wealth for private consumption as the stock gatherings. It is used to various religious performances, and as part of the bride-payment. When a man is visited by a friend or kin, he gives them beasts-sheep, when there is a dance (meet) beasts-sheep is killed, and when men and women meet for a wedding or a naming they shall beasts-sheep. It is thus an indispensable part of Dorobo social life. When a man wants to relax, he has beer and goes to sleep, but his contentment is composed of social gatherings. Trading, commodity, and also wealth to him provide him with the entertainment, and conversation and gossip seem to take the place of games and liquor. I see no sign whatever of the game called bao by the Kipsigis, which is played with seeds or pebbles in holes in the ground or in a board, and none found is mentioned. I omitted one one board of a dance, and I never saw board a Dorobo of other any display.

The principal drawback of wealth is really a man's debt as trapper, hunter, and bee-keeper. But the products of this debt are perishable, and certainly the only way in which tangible wealth could be accumulated was in the form of weapons, honey-barrels, and dogs. Even that the old bi-string necklaces have gone. It is becoming possible for a man to accumulate wealth in a very limited extent in cattle or goats, which he can get by purchase, gift exchange, or through bride-payment. The use of money has just become familiar, and a certain number of Dorobo own wages, but enough for one or two who have joined the Police, wages are not high, and the average is now only 7 to 10 shillings a month. So far the Dorobo have had little achievement to work for wages, except that by agreeing on an appointed for a small wage they can acquire a temporary right to live on other way there were land. Beyond the fact that money enables them to buy a little extra food, one like of wealth means little or nothing to them, and they have not yet advanced far enough into the investment stage for it to be anything more than a small supplement to their traditional way of living. It is all that they can do to maintain themselves for stock accumulation reserves or surplus wealth.

The investment stage which the Dorobo had reached by 1939 is that from hunting to agriculture, with at the same time a strong desire to acquire cattle. It is sometimes suggested that hunting peoples like the Dorobo are really agriculturalists or pastoralists who have had to give up their agricultural or pastoral way of life and take to hunting. This may be true of some, such as the 'Ogiek Dorobo' (a name of Kenya who are mainly cultivators and hunters from various tribes, that is quite clearly not true of the real Dorobo.[1] The tribe who form the subject of this paper, who are economically non-pastoral and non-agricultural. Their basic hunting tendency is shown by their character and behaviour, by their hunting techniques and skill, by

[1] Cf. my remarks in JRAI for 1939, p. 335.

Schlesinger Lib. 8-5 [2016-0319] 1953 FLA Dorobo FLA

Fig. 3. A Simpler Kind of Springe. This trap has an "trigger peg". The animal treads on the platform and by so doing presses it against the upright S, to which bone B is attached, thus releasing the bone and allowing the bent stick D to spring upright and tighten the noose round the neck of the quarry.

when an animal treads on it, allowing the bone to slip over the top and thus release the bent stick D.

Hunting parties might be made up by as many as eight men, though I think that probably two or three was a more usual number. A common practice was for half the party to work along one bank of a stream and the rest along the other bank, so that if there was nothing on one side, those on the other side might be more successful; or if the quarry got across the stream, the men on the other side would be able to deal with it. When a kill was made, all the hunters assembled. The animal was skinned, the meat cut up, and some of it eaten on the spot, either raw, or partly cooked by laying it across a rough wooden framework over a fire. The rest of the meat was divided among them and taken home. In the lean days, when meat was plentiful, what was left over was dried and kept either as a reserve or else exchanged with the Kisii for cereals and millet. A stock of dried meat (purchased about 3 ft. square, was sold for about 20 lbs. of grain. Meat is cut into strips (or, whenever evidenced) which are laid out on the drying tray or left over the fire to be smoke-cured, after being dried on the roof of a hut or in the fork of a tree.

c. Agriculture

Since they can no longer hunt, and present conditions are* not favourable for the acquisition of cattle on a large scale (even if the Dorobo had the means of so doing), the adoption of agriculture has become an economic necessity, and methods, implements, and seed have been obtained from the Kisii. This change from hunting to agriculture has taken place virtually between the years 1927 and 1938. In the first of these years the area cultivated by them was so small as to be negligible; but by the latter year they (very soon, as we have seen, to a great deal centered on agriculture. And as with hunting in the old days, so with agriculture to-day, the growing of crops is naturally regulated by the wet and dry seasons and the main divisions of the agricultural year are:

January to April	preparation of the land.
April-May	planting.
September	reaping.

* This refers to the years 1936-39.

and lying about on the floors. The only weapon is the bow, invariably called the Dondos make themselves from the hunter tree (*Dondos sp.*); it is about 5 ft. long and the bowstring, too, is made from part of the plant (fig. details). Arrow-shafts are made from the *Acrocomia* and *Astrocaryum* trees, or from bamboo, whereas arrow-heads are bought from the Ouaili, and are of the Ouaili patterns. Arrows are worked in extreme cases of need. Arrow guards are made from the outer bark (*Acrocomia*) (fig. details).

Basketry

Making baskets, hunglet, is a common occupation of Dondos women. They are made from fibre of the palmate monkeep palm, *Astrot*, and sewn with bast made from a plant called *Apparendo*. The technique is a spiral foundation with a flat fibre gradually overlying rod, of the simple over-and-under type and two-step variety, the stitches being spaced out and not close together.

Miscellaneous

Salt used to be made from the ashes of the plant *Apparendo* (vanilla aeroptiloba). Red and white earth is found near Tambarma on the east of the Dondos country, and men go in parties of four or five to dig it, carrying home the earth in large basket bags, mainly in order to sell it to the Ouaili tribe, to 1936, gave them 2s. a bag. Red earth, *arotuat*, is mixed with fat or grease oil for rubbing on the hair; white earth, *arootat*, has magico-religious uses. For carrying a number of small objects a carrying-net called *bibaddo* is used; it is made of a pair of oval rims 2 ft. 6 ins. long with pieces of bark stretched across them, somewhat resembling a pair of tennis-racket rackets. These are sometimes used by the Ouaili.

Beliefs and Customs

Religion

Adeito, the sun, is recognized as a being that can supply or withhold the needs of people: *Ado, ajaiyo jamyeh*, "*Ado*, fill us with meat," is a common prayer. Some say that *Arawa* the moon is his sister, others that she is his mother. Besides *Ado*, it is believed that there is a being called *Idri*, the thunder, who produces rain, and "the rainbow is his arm which draws up water for him." The Dondos also believe in spirits, good and bad, both of which are called *mwandos*, a word which includes the *mili* (ancestral spirits) and *mwandwandi* (evil spirits) of the Ouaili. The ancestral spirits have the same significance and functions as those of the Ouaili, and though they punish the living for doing evil, they are otherwise friendly and visit the living, according to the bodies of snakes, both to see their people and to get food in the form of *bikwarb* (honey and sweet); spirit-snakes should not be killed.

Divination

The Dondos appear to have no diviners of their own, and when they have recourse to divination, as in cases of illness or witchcraft, they go to Ouaili diviners of the type called *adeyaut*, by whom they are charged a small fee. The people called *arbaiyat* (pl. *arbaidi*) among the Dondos are no more than healers or physicians who prepare healing medicines from trees and plants. Although the Dondos have a reputation among other tribes as powerful rain-makers, they themselves say that they have no rain-makers, which is probably true.

Death and Burial

Very old men and women are buried in narrow holes about 5 ft. deep in which the bodies are laid full length wearing their clothes; one year after an old man's death his children plant a branch of *mahajirat* (*Dracaena sp.*) on his grave and let it grow. Other people are laid out for the funeral, both sexes on the right side with

[illegible]

differ little from that used by the Maasi and many Bantu tribes. This one is, primarily, a tool and not a weapon. They also carry the usual Maasi club, which they call *rungu*.* This club is used indiscriminately as a throwing or hitting weapon. The Dorobo are excellent shots with it, but are more expert with the bow. The latter weapon they seem to venerate; they are for ever holding archery competitions among themselves, and it is an uncommon sight to see a Dorobo devoutly swinging the bow-string of his bow (often little shorter than himself) and deriving obvious pleasure from the sound produced thereby.

A skin bag or bottle, of the usual Maasi pattern, is used to bring home honey collected in the bush. The Dorobo carry this, when full (the same remark applies to any other load), by means of a strap of bark or leather round the forehead. The load hangs between the shoulder-blades in the usual Maasi fashion.

The *Maasai* and *Dorobo* Languages

(A comparative list of numerals, words and tenses, with the equivalents in Maasi and Dorobi.)

The following symbols or marks have been used to assist in the correct pronunciation of the numerals and the short lists of words and tenses given. They have also been used throughout the text. Most of them are used as in Hollis's well-known works on the Maasi and Nandi.

The symbol ~ when superimposed denotes that the *ng* occurring in the word has the same sound as the English *singer*. In cases where it does not appear the *g* is hard.

A diæresis has its usual grammatical significance.

' denotes that the letter beneath it is definitely accented.

" denotes a long open vowel. *ai* has been used in some words to denote an intimable, long, drawling sound.

An elevated letter (as in *dolo*) denotes that the letter in question is barely perceptibly sounded.

Where ' appears over a vowel, it means that the letter has a

* This club is almost always made of the wood of a tree called by the Maasi *O-rorua*. According to the authority quoted in Hollis, this tree is the wild olive (*Olea chrysophylla*). *O-rorua* only also means the heart-wood of a tree (Hollis).

[illegible]

The [illegible] and what can be avoided from it—would be the love and sorrow, horror for his wife and children and for horror, the birth of the Ch-ambakam [illegible] son, then for plotting into his hut, and last (but most important of all) the skins and the meat of game animals—these things formed the business of the Dondo. It is therefore not to be wondered at that such folk-lore tales as exist among the Dondo of the present time are chiefly concerned with animals and animal life. Similarly, the paramount interest in life of the Bushman is apparent from a study of the extant folk-tales of that tribe, which deal, to a great extent, with cattle and other domestic stock. The tales are been told to-day are, to all probability, but a few of the more widely-remembered of a host of stories now forgotten for all time.

The following examples have been selected from a large number of stories told by the Bi'ukwe themselves and admitted by the Bushmen to be Dondo in origin.

The Jackal and the Elephant.—The Jackal, when out walking in the bush one day, chanced to fall over a piece of elephant-dung in his path. This made him very angry and he said: "How am I inconvenienced by the dung of the elephant! I am so small that I cannot hope to inconvenience him in the manner, but I will arrange for all the members of my tribe to come and make use of the place, and thus in time the heap may grow big enough to trip a passing elephant." This is the reason why piles of dung, showing that many of these animals have used the same place, are often seen in the middle of a bush path. (A story very like this is told by certain Coastal tribes.)

The Tortoise, the Hare and the Hyena.—These three made an agreement to rob a rich trader. The latter had cattle and

* "I am listening to something in the bush." (1) the Bushman's bush.

* *Ekwaxa ambakwaxa*, according to the authority quoted in Bushman. It is said as a remedy for worms and to produce a large appetite. It is highly prized by the Bushmen and is scarce in the Kalahari bushveld.

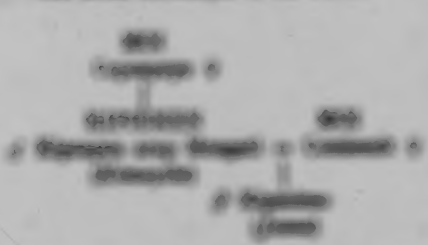
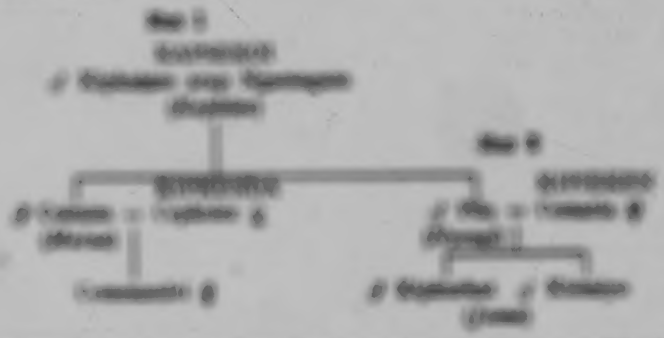
DIVISION OF FORESTS
BY THE ENGLISH
NDIRE FOREST
Kipsamut Clan
Kipsamut Clan

[p.57]





[illegible]

[illegible]

[illegible]

This area is a gazetted Forest Reserve, and the official boundary marked by a broad line where the bush and trees have been cut, new posts between existing the actual area of trees. This boundary has a high value for the Forest Department, but it acts in some measure as a firebreak. It is also the upper boundary of a belt of European forest which occupy the land between the forest and the Duala Reserve. On this strip of open ground between the trees and the forest most of the Duala now live, and it is on these farms that some of these were.[1]

The forest itself is bordered in many places by a narrow belt of woody Raso bracts volcanic, the Nkongsamba Basin-rock, as it does the case in eastern Europe. Between the trees and the forest are glades (prairie) shrubby open spaces separated from the outside world. The forest is evergreen "high forest", the trees, many of them 100 ft. and more in height, growing close together so that the branches and foliage which are mostly at the top form a crown or canopy that shades the ground from the sun. In ground level the open between the trees is largely covered with thick, tough undergrowth and giant thistles, up to a height of more than six feet, which make it impossible to travel except along a path. The rainfall is heavy and [illegible] on frequent. In the dry months there is occasional frost even in open ground. As a result of the dense tree cover, the forest is always wet during the rains and in the dry months some moisture stays below the damp disappears.

From our commercial point of view the forest is perhaps not of very exciting value, but it is from these several acres and we shall have to the Cameroons after its last judge more by their value as marketable timber. Of the many kinds of tree in the forest, the following have been identified:

Canarium, three sp.	Bonnetia, euphorbia scandalosum.
Bubinga, acuminatissima Gilletiagum.	Anglea, gedunculata sp.
Eriospermum, nitida sp.	Asteranthi, mossa majora.
Lasiantheri, silvestris amaniensis.	Cynodium, mostra dictyoneuroides.
Khaldenyum, polygamum lomaglobosa.	Kostrum, arcuata mollusca.
Khaldenyum, discolorata sp.	Eglandia, three sp.
Alberticyum, dicu dicyanophylla.	Asterigum, ornatifolia stylosa.
Cleomeli, three sp.	Fort, jussiperma grossa.
Ficum, Dracaena sp.	

Where the Dendre forest in the forest, main homesteads were marked by narrow and hardly discernable paths through the undergrowth, somethyin some of these paths are still used as approaches to heavy-laoded and game traps. The forest was far traversed by two tracks only, one running from Kipkorom to Isangire, the other parallel to it from Kipkorom to Isangire. These being the only through tracks, people going to Tinkonne have to go along either the northern or the southern edge of the forest.

[1] The forest are extensive, and only their lower parts are actually occupied and worked, so that in actual fact there is an interval of 1-2 miles between the Dendre and all signs of European activity.

6:Huntingford E-5 (1938-1939) 1953 FL6 Dorobo FL6

other Dorobo would not like it", in the words of one old man. (2) The animals on whose flesh they feed and with whom they themselves have something in common, live in the forest. (3) In the trees live the bees whose honey they eat and drink, a substance as valuable to them as milk to the Nandi. (4) The forest is not only the medium of their life, but their protection. And so even to-day when they can no longer live in the forest, they still think of it as their own, and the division of the parts beside which they have made their settlements is of the utmost importance to them.

The division of the south-west corner of the forest between Kipkorom and Sosoiyo as it was in 1939 is shown in the Map. The forest is here divided into several unequal areas, bounded on the NE side by the main through-track from Kipkorom to Sosoiyo, and crossed also by the other through-track from Kipukua to Sosoiyo. The main track is used a good deal by the Nandi who go to see their friends and relations on the farms in the Meteitei valley; the other track is used mainly by Dorobo, and their honey-barrels and traps occur mostly along it, whereas there are none on the main track because strangers might interfere with them.

Between the two main tracks is the Ain ap Tiset, a stream which forms the northern boundary of the areas held by the Kapkulelac (I), Kapsituni (II), and Kapsingira (III) families, the last of which extends eastwards towards the main track. Group N° I is represented by Arap Keter, Kipungri, and Kipasa, three brothers; N° II by Arap Minia; and N° III by Arap Singira. The occupiers of I and II live at Kipukua, and of III at Sosoiyo. The Ain ap Tiset is the southern limit of the area held by the Kamuru (IV) represented by Arap Korucu who lives at Kipkorom, his land reaching to the main track. East of the main track, area N° V is held by the Kaporpousita family represented by Arap Ceruiyo and his brother Arap Cepousita who live at Ndoroton. Above this is area N° VI, held by the Kaptokoni, represented by Koriomoi who lives at Upper Sosoiyo in the forest. And finally N° VII is the easternmost area, occupied by the people who live at Upper Ngatepkoo in the forest and Lower Ngatepkoo outside it. These are a mixture of six families: Kamnasutik, represented by Totê; Kamereua, represented by Nekui; Kapkorongua, represented by Kilanya; Kapkimanoari, represented by Arap Euni; Kapkipopo, represented by Kipirec; and Kapkuikoi, represented by Sulio[1]. These holdings are clan areas as well (except in the case of N° VII where four clans are represented, and the division could not be satisfactorily traced):

I. Family Kapkulelac II. Family Kapsituni IV. Family Kamuru	Clan Moi.
III. Family Kapsingira	Clan Kipiekem.
V. Family Kaporpousita	Clan Kipamui.
VI. Family Kaptokoni	Clan Kapuekoi.

[1] The prefix *Kap-*, besides meaning "place of", also means "family of", and is added to the name of a principal recent ancestor, who may be a woman, e.g. *Kapsituni* is named from *Situni* the wife of Arap Minia's father's father.

6:Huntingford E-5 (1938-1939) 1953 FL6 Dorobo FL6

423 It will be seen from the map that honey-barrels and traps are the main forest activities, the shambas being outside the limit of the trees.

The Dorobo had developed a habit of saying that there were no honey-
[231] barrels in the forest. Certainly this would seem to be true to anyone who goes through the forest along the main track from Kipkorom, for there one sees no sign of any activity at all. But on the other track, where few but Dorobo go, there are plenty of them, especially in Area I where Arap and his brothers are very active, several of the barrels near the path belonging to his unmarried half-brother Kipungri. In Area II there are not so many, because Arap Minin regards himself as an old man by now, and unable to
[186] work much (he is actually — in 1939 — about 40); his brother Arap Ruto works on a farm and is less active in the forest than Kipungri. But Arap Minin has at least two honey-barrels, which he showed me, as well as a trap
● [487] in which not long before he had caught a bushbuck. A few paths branching off the main track which had once led to traps could still be distinguished, though they were not used in 1939. In Area III there was a new path leading to a trap made by Arap Singira some way from the track. In Areas VI
[361] and VII some of the people still live in the forest in the old type of Dorobo hut, the *kesoget*.

Now these areas are not very extensive. The space of forest occupied by Areas I-IV is perhaps not more than six square miles or thereabouts, and that of Areas V and VI may not be more than four square miles. But a mile on the map is a very different thing from a mile on the ground in an African forest. The Dorobo have been forced by economic pressure to concentrate; and since the adoption, even on a small scale, of agriculture, the dependence on hunting has naturally been reduced. In addition to each forest area must be reckoned the strip of open land where they live, cultivate their little shambas, and herd their few livestock. Moreover the central and unoccupied part of the forest is open to anyone who chooses to hunt there, though there were no indications in 1939 that they actually did so. In the old days the
177 forest areas may have been larger, though when all the *kesoget* were occupied
423 there cannot have been very much difference in size. But a relatively small area is enough for bee-keeping, trapping, and food-gathering, and it must be
[224] remembered that in the past, before the forest people's economy was disturbed, they ranged much further afield to hunt with bow and arrow than is possible to-day, and the forest was primarily regarded as a trapping area. Various statements leave no doubt that the Dorobo used to hunt right over Nandi and Uasin Gishu, as well as in the high country east of Timboroa. Thus, though their own territory was limited in extent, their dry weather range was wide, and the supply of game more than adequate to their needs [1].

114 [1] This paper deals with conditions that existed up to 1940; the use of the present tense must be taken as referring to that period.

Apart from the rule of exogamy, there are certain other marriage regulations:

1. A person may not marry anyone who comes into the *tiliet* or relationship (except F. Sis. D. D.), that is, anyone addressed by a relationship term, or as *oryon*.
2. A man may not marry his wife's sister because such unions are thought to be sterile.
3. A person may marry into the clan of his or her M., M.M., Br.W., or Sis.H.

Pre-marital intercourse with anyone in the *tiliet* is forbidden; but with a clansfellow condoned, though not approved of.

The shortage of women and the lack of wealth have resulted in the Dorobo being largely monogamous, though if a man has the wealth, he may have more than one wife. The *hedua* (bride-price)[1] is said to have been formerly 4 oxen for slaughtering; today it is 1 cow, 1 ox and 4 goats, which go to the bride's father and become his personal property. This *hedua* is high for a people who own little or no stock; but by means of gift exchange cattle can be obtained from the Nandi (See below, p. 192.) Rarity of divorce is another result of this shortage, and since a wife is something comparatively hard to come by, she is more cherished than is usual among other peoples where women are plentiful. The inability to get wives has produced a tendency to what may be called *monôsis*, that is, unmarried men (some of whom never marry) live entirely alone, and do all their domestic work, as well as hunting and cultivation, without assistance.

III

ECONOMIC LIFE.

A. Environment.

The home of the Kapchepkendi Dorobo is the western end of the high ground which occupies the country between Eldama Ravine and the Nandi escarpment. The greater part of it is covered with dense forest, and is crossed on the S. W. corner by two parallel paths from Kipkorom in the north to Ndoroton in the south. The forest begins about the 8,000 ft. contour, and to reach it from any side entails a steep climb of

[1] On this term, see "Bride-price in antiquity," *MAN*, 1931, 187.

/230 cont./ It is to be
613 noted, however, that there seems to be no El kiboron among the Asá,
171 as is shown by both the consistent assertions of the people and the observations of the author, who did not find any members of that lineage among them anywhere. The respect and esteem that the El kiboron enjoy among all the Masai people sufficiently explains the fact that, with the displacement of the Wandorobo at the time, they were adopted into the community of the oppressors.

/231/ II.

000 Plan and arrangement of the camp. -- The huts. -- Household equipment. -- Daily life, food, work. -- Earthen pots. -- Baskets. -- Leather dressing. -- Market trade. -- Honey extraction. -- Manufacture of bows and arrows. -- Spears. -- Dance and song.

361 The Asá roam the steppes as hunters, in that they wander with
[224] the game, whose meat gives them food and out of whose skins they
[237] make their clothing. This circumstance brings along with it the fact that they can not live together in large kraals, but rather, divided into small bands, are forced to stay here today and in a
[342] distant place a few weeks later. Accordingly, their camps (aijo) only consist of hastily built small huts (morog) that are made out of branches and grass. The camps as a rule are hidden in dense
[489] bush and have no special enclosure. The paths and game runs leading to them are carefully barricaded with thorn branches and thus made inaccessible. Only the practiced eye of the Asá will find the wonderfully concealed entrance to the camp.

621 Only two or three families, rarely a few more, usually live in
[591] one camp. Next to their huts are found those in which the unmarried circumcised men (dobonog) live with the young girls. As among
[192] the Masai, each young man has his favorite girl. He calls her
[191] sanjet uan, she calls him sanjeg uan, words in which one again finds the Masai word sandja. Their huts are designated as morog

possibly these Dorobo had been poor Masai, who, having lost their cattle, had taken to hunting, is probably the correct one. It would appear likely that the Dorobo in question were *Balaŋga*, though Sir Claud was unable to satisfy himself as to their true origin.

The original *Balaŋga* are stated to have come from the Kisongo [1] district of the Masai. It may be that this is the case, as the name Kisongo originally stood for a very large tract of country—in fact, almost the whole area occupied to-day by the Masai of Tanganyika Territory. It is certain that there now are *Balaŋga* Dorobo with the Masai throughout the length and breadth of the Tanganyika Masai Reserve, and it becomes more difficult daily to find *Balaŋga* who still devote themselves to hunting. Even those who own little or no stock prefer to live with their richer brethren or with the Masai. The younger men have never led a bush life. They carry spears [2] (and, when appropriate, shields) and do not care to be reminded of the fact that they were ever other than the Masai.

Occasionally, when an elephant or other large beast is killed by the European sportsman, a few old men (Masai, to all outward seeming) will make their appearance unobtrusively, generally accompanied by donkeys. Having obtained permission, they will proceed to rip and hack away huge quantities of the flesh with a determination and cheerful abandon seldom to be met with in the Masai. When the donkeys have been loaded with as much meat as they can carry, the old gentlemen will quietly depart, bound, presumably, for a banquet of Gargantuan proportions. Should one ask, they will admit shyly that they are *Balaŋga*, but will almost always add: "We are now Masai again."

I think there can be no doubt that the Masai and the *Balaŋga* are one and the same. The opinions of the Masai (notoriously unwilling to admit the equality of others) and the *Balaŋga* themselves are unanimous on the matter, and I have been unable to discover any shred of evidence to the contrary. It would appear reasonable to assume that the *Balaŋga* are the

[1] Cf. Hollis: *Masai Language and Folklore*; pp. 260, 261. The name would seem to be restricted, nowadays, to an area south-west and west of Arusha. (Map reference: B 5; Kilimanjaro: E, F, I, K.)

[2] The spear would not seem to be an indigenous Dorobo weapon.

/64 cont'd/

"to have occupied the land along both banks of the Aboni[1] or Amboni River. They intermarried and traded in famine years with the Kikuyu, and cannot remember having come from any other part of the country. For the most part, they lived apart, hunting in the /65/ Loldaika Hills. Between 1905 and 1912, when the alienation of land to Europeans took place, they were pressed northwards to their hunting grounds, and eventually settled down with the Mukogodo, having acquired cattle from the Masai and early traders, such as Mr. John Boyes. They included the El Choki plains within their grazing area. Their language is similar to Masai."

648
101

Mr. John Boyes told the Commission of a meeting between himself, a Dorobo chief Olomondo, and the Kikuyu chief Wangombe, and Wangombe's son Ndirango, in a memorandum to the Commission, speaks of "Chief Olemondo of Dorobo of Donkeys". The Dorobo referred to are clearly the Ndigiri[1], that being the common Kikuyu word for 'donkeys'.

The "Dorobo Committee" classified the Loldigiri among the group living north of Laikipia and Mr. Huntingford puts the Digiri among the true Dorobo of his Eastern Group.

101

1. The Gaki Kikuyu also call this river Honi. Aboni in Kikuyu means "the Honi people", and honi may be related to an original Nyika stem foni (f bilabial) which, prefixed by n, would give mboni in Ndia and honi in Kikuyu. Some relationship between the Ndigiri and the Coast Boni might possibly be indicated.

1. Perhaps it was among the Dorobo that the Kikuyu first saw donkeys, which appear to have been unknown to the Bantu tribes of the Unit until comparatively recently. A Nyeri elder told me that the Ndigiri used donkeys instead of women for the transport of the meat of animals killed in the chase.

[492 231]

/231 cont./

621 to dobonog, i.e., huts of the unmarried men, in contrast to the
192 alja to dalma, the camp of the married. Therefore here, too, we
071 find, even in the name, a separation into kraal of the married and kraal of the warriors, similar to the one mentioned for the Masai.

171 The arrangement of the interior of the hut, like the form itself,
353 resembles that of the Masai; its furnishings, however, are even
415 sparser. A honey pot (madjé, madjeog), a gourd bottle (mget) for
257 drinking water and honey beer, a leather bag (lebenu, lebenua)
283 for collecting honey, a larger one (ndaro, ndarerañg) for water, a
352 few earthen pots, larger ones (idug, idia) and smaller ones (ruguba,
412 ruguba) for cooking, a couple of wooden bowls (tagi), a rope cut out of an animal skin (scharu, scháruga) to tie up the slain meat, a cord twisted out of the bark fibers of the baobab (Adansonia digitata) for the drawing up and letting down of the beehives hung in trees (meriñgo), along with a few dehaired skins (fulót) that serve as beds, as well as ax (halo, hauerag) and knife (pandyug), constitute the
• 492 principal household equipment. In a few huts one also finds the en
412 dereta /pack-holders/ of the Masai, here called lalaho (leleweg),
413 as well as a hammer (giribót) for forging and a chisel for designing
177 the arrow points (mat, mara), and finally that sharpened small piece of sheet iron serving as razor-knife (herá, hererá). The entire family,
592 namely, husband, wife or wives, and the uncircumcised children, live in one /232/ hut. Men and boys, however, are usually out.
512 The day begins even before daybreak for the hunting men. They
824 set out with a snack consisting of a little piece of boiled or roasted
264 meat, so that the first light of day already finds them in the hunting
825 grounds. The game now behaves best; as they say, it then feeds more eagerly and carelessly than a few hours later, when the sun already becomes annoying to it. At daybreak women and children leave the huts; firewood and water are carried up in order to cook
251 the meat fetched from a larder located in a nearby tree. The meat is kept there and not in the camp, so that it hangs in the air and
512 thus remains fresh longer. After that the morning meal is eaten.
264 Actually the Wandorobo do not have definite mealtimes: as long as there is something edible they simply eat as long as they can.

000 Clothing and adornment. -- Cloth materials. -- The individual articles of clothing and adornment, compared with those of the Masai. -- Head and body hair. -- Nails. -- Painting. -- Tattooing.

439 648 177 Cloth materials, such as are the tender of the caravan people in the barter trade, have been adopted only to an extremely slight extent among the Asá. The principal reason for this is that they only rarely come into direct contact with the caravans; rather, under pressure from the Masai, /252/ they are forced to deliver to them their yield in elephant tusks, hippopotamus teeth, and horns of Rhinoceros bicornis for a small compensation. There is no question of a legal barter trade; the Masai buy kwa nguvu = with force, as the coastal peoples so aptly designate this type of trade.

291 191 One therefore sees the Asá almost solely in their original leather clothing (hide worked into leather, magadeg, magadaig), which, in cut and manner of wear, is identical with that of the Masai, but looks poorer and often ragged. This poverty is particularly noticeable for [511] the boys' and mens' capes, called e megiti and en joriba by the Masai, which the Wandorobbo name the same, and which here are also worn by older men because in hunting the ol gela is too inconvient because of its length. The dobonog otherwise do not generally wear the e megiti, rather more often an en joriba made of calf hides, which they [561] [237] buy from the Masai; older men often have it made out of the hide of [439] the female black-heeled antelope. The costume of the women is here called ñik (pl. tik), as is the upper part of it (ol egichobo of the Masai) by itself, while the lower one is named after the Masai designation ol ogemana gemána (pl. gemanán). The ol gela i ol morusk is here called ngk o dalima and is considerably shorter than the former, only a little longer than the en joriba. Sandals (ichiba) serve them as footwear, which, however, in general are not used. In adornment 301 561 832 the poverty of the Asá is shown particularly among the dobonog, though one must also consider that their desire for favor in the eyes of the fair sex is, as a result of circumstances, very considerably less than

/254 cont./

XI.

Interment of the corpse. -- Hereditary succession.

764 [171] [511] [556] The interment of the corpse differs from the practice customary among the Masai only insofar as the poverty of the Asá affects it. They neither hold a funeral feast nor do they anoint the corpse with fat. Wealthy people, i.e., here such with numerous progeny, are here buried by some, and, to be sure, in the kraal near the hut, so that after death they may hear the conversations of their children and enjoy the fragrance of their meals. All other corpses are simply dragged out of the kraal and put down approximately 100 paces from it. If the corpse has not already been devoured by hyenas the first night, which, moreover, is said not to happen only rarely, since in reality these carrion-eaters roam about the usually foul-smelling camps every night, /255/ then one burns as an offering the residue of the honey beer, consisting of wax particles, beside the corpse. A burial of corpses outside the camp is not customary anywhere. [782] The prayer beside the corpse of a family father runs here: Ulit, nge gurgurta, nge haga = God, father, give advice, give meat. What 765 171 was said above about the Masai holds for the mourning. 3/A

---

428 [171] In the right of succession the same principles hold as among the Masai. The insignificance of the goods left behind, however, often makes a division among those qualified to inherit impossible, and one can therefore very often observe in practice that the eldest son (of the principal wife) receives the entire inheritance consisting of bows, arrows, and beehives. The latter form the principal part of [171] the estate and, after the death of a man, are distributed among the sons in the same way as the cattle among the Masai. Just as the latter gives each of his wives a number of cattle to care for and enjoy the use of, the ol doreboni leaves each of his wives a part of his beehives, which the sons of the wife in question then inherit. Widows 768 as a rule join a man of their age class and live with him. Surviving [583] daughters pass into the possession of the eldest son insofar as the bride price is to be paid to him upon their marriage.

1/A. [See Masai FL12, 18 Merker, category 765--Analyst]

/231 cont./

621 to dobonog, i.e., huts of the unmarried men, in contrast to the
[192] aija to dalma, the camp of the married. Therefore here, too, we
[071] find, even in the name, a separation into kraal of the married and kraal of the warriors, similar to the one mentioned for the Masai.

171 The arrangement of the interior of the hut, like the form itself,
353 resembles that of the Masai; its furnishings, however, are even
415 sparser. A honey pot (madjë, mädjeog), a gourd bottle (mget) for
237 drinking water and honey beer, a leather bag (lebenu, lebenua)
283 for collecting honey, a larger one (ndiro, ndareraŋg) for water, a
352 few earthen pots, larger ones (idug, idia) and smaller ones (ruguba,
412 ruguba) for cooking, a couple of wooden bowls (tagi), a rope cut out of an animal skin (scharu, scháruga) to tie up the slain meat, a cord twisted out of the bark fibers of the baobab (Adansonia digitata) for the drawing up and letting down of the beehives hung in trees (meriago), along with a few dehaired skins (fulót) that serve as beds, as well as ax (hallo, hauergg) and knife (pandyug), constitute the
492 principal household equipment. In a few huts one also finds the en
412 dereta /pack-holders/ of the Masai, here called lalaho (lelewgg),
413 as well as a hammer (giribé) for forging and a chisel for designing
177 the arrow points (mad, mara), and finally that sharpened small piece of sheet iron serving as razor-knife (herá, hererá). The entire family,
592 namely, husband, wife or wives, and the uncircumcised children, live in one /232/ hut. Men and boys, however, are usually out.
• 512 The day begins even before daybreak for the hunting men. They
[224] set out with a snack consisting of a little piece of boiled or roasted
[264] meat, so that the first light of day already finds them in the hunting
[225] grounds. The game now behaves best; as they say, it then feeds more eagerly and carelessly than a few hours later, when the sun already becomes annoying to it. At daybreak women and children leave the huts; firewood and water are carried up in order to cook
[251] the meat fetched from a larder located in a nearby tree. The meat is kept there and not in the camp, so that it hangs in the air and
512 thus remains fresh longer. After that the morning meal is eaten.
264 Actually the Wandorobo do not have definite mealtimes; as long as there is something edible they simply eat as long as they can.

/233 cont./

512 After breakfast the day's work begins. Huts must be repaired [356] and renovated, for which branches and twigs for the frame, bast for binding it, and long-stemmed grass for covering the roof and [462] lining the walls are procured. When the women are not busy with this, with cooking, with fetching water and gathering firewood, one usually sees them sitting in the shade with some handwork. They [294] sew clothing, bags, leather covers for the wooden pots, cut straps, [281] etc. Concerning the ornaments, the Wandorobo make for themselves 306 those things that the Masai also make for themselves; they only buy 439 the metal-forged work from Masai blacksmiths. The making of the 323 462

Fig. 81. (1/10)

ball-shaped earthen pots (Fig. 81) falls to the women. From dark-gray clay (anjet) they shape the pot with their hands (without a wheel) and let it dry in the sun, after it has been decorated, usually with cord ornamentation. Before being fired, it is usually stuffed with dried grass prior to being put in a fire made with dried tree bark with which it is entirely covered and in which it remains until it takes on a dark red color. The finished pot, in order "to protect it from cracking during use," is thoroughly heated on the hearth fire, and then boiling water, in which a bone has cooked, is poured in.

281 The dressing of the hides from the most recent hunting booty also takes a great deal of time. Those intended for sale are, of course, simply nicely cleaned of all meat and fatty parts and then, pegged to the ground with sticks, dried in the sun. The others, [171] however, which are to be used to make clothing, are worked into 000 leather in the way described for the Masai. As there, the tanned

/235 cont./
411 322 [283] [237] with fat several times, it is bent over the fire. The string is plaited together, turning and braidlike, out of short animal tendons and is extended by further interweaving up to the required length. The projecting starting-ends of the individual pieces of tendon are neatly cut off, whereupon one then rubs the now finished bowstring with some fat.

The arrow shaft (Fig. 84) is carved out of a dry wooden stick, first rounded, then smoothed by scraping. The upper end is wound [237] [824] [412] with tendons that have been coated with the varnishlike juice of a not yet described species of gladiolus known as dirigẽ, whereupon, on top, one drills in the one- /236/ /Figs. 83 and 84 appear here/ 411 [237] [136] [283] [824] centimeter-long hole for the tang of the arrow by a twirling motion with a thin wooden chisel. At the lower end the three-part feathering -- out of the feathers of the carrion vulture (Neophron percnopterus) -- is first fastened on by being wrapped with a very fine bast thread and then glued fast with the gladiolus juice just mentioned. Another wrapping of animal tendons is found between the feathering and the rear notch for the bowstring, in order to prevent a splitting of the shaft.

[325] [322] [171] [439] The people buy the iron points; only if a point breaks off /237/ do they as a rule forge a new one for themselves. Clubs are carved from a piece of wood, as among the Masai. They buy the spears, of which there are one or more in almost every camp, from the blacksmiths of the Masai. The spears serve as weapons only in the camp, where shooting with arrows is not permitted, on account of the danger connected with that, since they are always poisoned.

415 [439] [285] The Asá for the most part buy wooden bowls and gourd bottles from sedentary tribes. On the other hand, in some places they plait shallow baskets, which they use for storing food.

524 829 171 The fact that the Wandorobo do not play the board game so popular among the Masai was explained to me by them with the words: "During the game we would forget to hunt and then, with our families, would have to starve."

512 517 [273] [535] [533] With the coming of darkness complete stillness as a rule comes over the camps, quiet even during the day; the day's work is done and everyone goes to his hut. Only on moonlit evenings do the old people often still sit in the open for a few hours, talking, with a gourd bottle of honey beer, while the young men and girls dance and let their falsetto song ring out through the still night, from

[TEXT CONTINUED ON PAGE 313]

512 /237 cont./
517 which now and then, as though as an answer, the cry of a predatory
[273] animal resounds over to them. The dance differs from that of the
[535] Masai through the fact that the men do not lift their feet, but only
[533] raise their heels. The narrow, twisted plaza of the camp permits
535 only dancing on the spot. Just as there, here too it is accompanied
127 each time by song.
[321]
533 In a falsetto (1)

[126] 1. Recorded by Herr Stabsarzt /staff physician/ Dr. Skrodzki.

the tone, just barely reachable, roughly the A above middle C (sometimes stricken), is strongly accented and shrilly sung out. In an extremely irregular beat the succession of tones now descends in the six-four / $\frac{6}{4}$ / chord of A. At the A below middle C the chest tone sets in, but relatively softer then the falsetto, until, descending in the same degrees of the scale, the second A below middle C is reached. The final tones are more certain, because they lie better for the singer; the falsetto usually hovers around the tone sought, in part uncertainly, in part playfully.

Appoggiaturas, triplets are repeated all the more frequently the more certain the artist gradually feels in adhering to the melody -- sit venia verbi /so to speak/. No other figures are observed. Finally the voice once more glides within the seventh chord up and down the last octave; or the fundamental tone is phrased in contrapuntal fashion at the end. The entire song is an irregular variation of a six-four / $\frac{6}{4}$ / chord. It is limited almost entirely to two octaves. Through the greater probability of being hit properly the fundamental tones of the chord form the natural rest points for the voice and may sometimes be interpreted as strong parts of the measure. In marching they coincide with the putting down of one foot. Nevertheless there is not any sort of time that can be observed. The delivery is often parlando, and the tempo also corresponds to this style. The fact that the /238/ text is arranged ad libitum /at will/ for each use heightens the interest, if not the musical enjoyment, of the listeners.

/238 cont./

539 533 An overheard text is: "If I were a bird that is sitting beside the river and a zebra came to drink, I would, in the little bird's place, kiss (or bite) it, because I love it very much. But I am big and therefore can not."

• 512 Around ten o'clock at the latest the merriment reaches its end, and the camp is finally wrapped in silence.

825 The statement of the Wandorobo, according to which it is still supposed to have never happened that human beings have been killed by predatory animals within the camp seems remarkable. They [189] therefore do not fear them at all and believe themselves safe from them because of their magic medicines, some of which, according to popular belief, keep the wild animals far away, while others have the effect of the cap of invisibility.

III.

601 Kinship designations and terms of address.

The kinship designations are the following:
Father: aba or baba.
Mother: jējo or ea.
My wife: mai totuan.
My brother: bidjog uan.
My sister: bidjot uan.
Half brother: weku baba.
Half sister: wetu baba.
Brother of the father: bidjog e baba.
Sister of the father: bidjot baba.
Brother of the mother: bidjog ea.
Sister of the mother: bidjot ea.
Son of the father's brother: weku bidjog baba.
Son of the father's sister: weku bidjot baba.
Daughter of the father's brother: wetu bidjog baba.
Daughter of the father's sister: wetu bidjot baba.
Son of the mother's brother: weku agogesch.
Son of the mother's sister: weku bidjot ea.

II.—Mode of Subsistence.

Houses.

342 [361] The Dorôbo live in little shelters or huts (*kochonget*, pl. *kochongesiek*; N. *kwiet*) built in small clearings in the forest; they are made of a framework of sticks stuck in the ground, and bent over, forming a domed roof; the whole is covered on the outside with leaves of trees and banana leaves, which are insufficient, in spite of the addition of an ox-hide on the top, to keep the hut dry inside when it rains. The upright sticks are strengthened by others tied across them with tree-rope. The huts are oblong, with rounded ends, and are of the following average dimensions:—Height, 5 ft. 10 ins.; width, 7 ft. 6 ins.; length, 11 ft. They are occupied for two or three months, after which they become ruinous and "full of fleas," when the [590] family moves to a fresh site. Two to four people live in one hut. One group of huts we saw contained two huts, and had contained a third which had been pulled down. The huts are divided into two parts, the sleeping-place (*itôkto*, N.) and the [353] fire-place, which are separated by two or three poles laid across the floor of the hut, on one side of which are laid ox-hides (*muênik*; N. *muiuek*), upon which the occupants [513] eat and sleep; at night they cover themselves with skins. In the other half of the hut is the door (*kurket*, N.), about 2 ft. high. Some huts have two doors, opposite [354] each other. Between the door and the sleeping-place is the hearth (*mât*, N.), consisting of two or three smallish stones set on the floor. A loft (*sainet*, N.) is sometimes made in this part of the hut, extending across the width, and ending at the beginning of the sleeping-place. The loft is about 2 ft. 6 ins. above the floor, and [251] is made of thin sticks supported on thicker cross-sticks, and tied together with [302] tree-rope. Upon it are kept firewood and eleusine grain (Text-figs. 26–28). The [412] only household utensils are a small broom (*sdtutiet*) about 14 ins. long, made of [415] a bush-buck's tail fastened to a thin wooden handle, for sweeping the floor; "water jars" (*soiyet*) made of a hollowed piece of bamboo about 2½ ins. wide and 2 ft. 8 ins. long; a grindstone (*litêto*, N.) made of granite, for sharpening knives, [439] and for grinding eleusine grain. Gourds and earthenware pots are obtained from the Nandi; the Dorôbo have no stools. Fire is produced by means of fire-sticks (*piinet*; N. *piônet*) (Text-figs. 11*a*, 11*b*). A thin stick of the choruet tree (N.),[1] about 15 ins. 372 long and ½ in. thick, is stood upright on a stick of cedar (*teet*)[2] about 26 ins. long and 1 in. wide. The thin stick is called piinet, the cedar stick tasamet. The piinet is held between the palms of the hands, and the hands are rapidly rubbed together, beginning at the top of the piinet and working downwards (Pl. XXVI, Fig. 2). This is repeated until fire is obtained; the piinet drills a hole in the tasamet, and the heated wood-dust thus produced falls on to a knife-blade which is placed underneath. When sufficient heat is obtained it is laid on a small bundle of tinder (*sasyat* (dry grass) or fibre of the porôwet[3] tree), and blown till the tinder kindles.

[1] *Ficus* sp. [2] *Juniperus procera*. [3] *Dombeya* sp.

3:Huntingford E-S (1921-1928)1929 FL6 Dorobo FL6

When a man is ill and dies, it is said that bad oiik (*oiik* che *gach*, N.) have killed him; if he recovers, a good oiindet has saved him. No offerings are made to the bad oiik.

There is also a vague belief in a future life. A man's spirit is said to go at death to the *koret ap oiik* (N.), or land of the spirits, which is under the earth, and is a bad place.

Magic.

There are magicians (*pondindet*, pl. *ponik*, N.) who are bad, and who prevent people from getting food by means of their spells. There are also diviners (*orkoiyot*, pl. *orkoiik*, N.).[1] There is no equivalent of the modern Nandi system of "orkoinotet" or rule by a medicine-man.

Medicines and Charms.

(a) *Medicines.*—For snake-bite, the gum of the tiinet tree is used, mixed with the honey of a species of bee, called "kosomyot" (N.), and ram's fat. This concoction is rubbed on the affected part, and a little is also eaten. For coughs, a plant called "opeito" is chewed; this is used for all chest complaints.

(b) *Charms.*—Children wear a charm to ward off the evil-eye (*sukut*, N.), which is similar to that worn by Nandi children. It consists of a necklace of seeds of the lepuyuwet tree (N. *lapuonik*) strung on a cord, the seeds being separated by short pieces of bamboo (Text-fig. 20). Old men wear a charm to keep away rheumatism (*kimakunyet*, or *koroiito* (*koroitu*), N.); it is made of two small pieces of the rërendet tree,[2] about 1 in. long, which are tied to the belt (Text-fig. 19).

V.—Social Institutions.

Social Divisions.

The male sex is divided into boys (*ilgetik*, N.), warriors (*murenik*, N.), and old men (*poiisiek*, or *apaiisiek*, N.); the female sex, into girls (*ilpik*, N.) and women (*korusiek*, or *chepiosik*, N.). At circumcision, a boy becomes a warrior and a girl a woman.

Married and unmarried people sleep separately. Married people and small children may sleep in the same hut, while unmarried men sleep elsewhere, often in the sigiroinet (N.), or "warriors' hut," where they cohabit with the unmarried girls. Though free-love is practised, it is not carried to such an extent as among the Nandi, and although girls sleep with warriors, they like to preserve their virginity till circumcision. Warriors frequently marry their sweethearts (*sureriat*; N. *sureret*), whereas in Nandi they usually marry someone else.

The position of women is the same as it is among the Nandi, that is, they wait on the men, do all the menial work, and are their husband's property.

[1] This word is not used with the same sense in Nandi; originally it seems to have meant simply "medicine-man" (Swahili, *mganga*).

[2] *Euphorbia candelabrum.*

4:Huntingford E-5 (1938-1939) 1951 FL6 Dorobo FL6

888 helps his wife to bring up his children, continuing her claim on him in affection which outlasts childhood into old age.

596 My chief friend and informant among the Dorobo, Kimopo arap Mining, lived, during the period of my field-work, at Kipukua, with his mother Cesikirikat, and his family consisted of the following:

Cesikirikat ♀

♂ Arap Mining = Cepkumuren ♀

♂ Kiprotic ♂ Kiptuma ♂ Tiongoi Situni ♀ girl not yet named, born 3 Dec 1938.

[342] [361] In July 1938 he was living in a flat-topped hut in the middle of his section of the settlement; but by December of the same year he had moved to a new hut with a pointed roof outside the *shamba*. His mother's hut was about 300 yards away at the other end of the *shamba*. His three boys (all *Juma* age-set, he himself being a *Nyongi*) ranged from about four years old upwards, and Situni, the elder girl, was about seven. At this time he [513] [731] slept in the back part of the hut, the *incor*, where his goats are kept at night, and his wife slept with the children in the front part, the *koima*. This was because she was suckling a baby. Strictly, Arap Mining should have gone to sleep in another hut, but since this was not possible for several reasons, the wall dividing the *incor* from the *koima* was allowed to make the *incor* count as a separate hut (the original type of Dorobo hut has no partition at all).

855 One day I arrived rather early and found that Cepkumuren had gone across the valley to get a new water-pot, leaving Arap Mining in charge of the children. Situni looked after the baby, but still he found his responsibilities rather a heavy burden, and was glad when his wife returned a little before noon. Cepkumuren fed the baby, sent the children indoors to rest, and went down to the river to wash. At this hour, when there is no particular work to be done, the older people sleep. On some days Cesikirikat comes to Arap Mining's *shamba* to help with the cultivation: Cepkumuren [241] normally works there too, but not every day while the baby is so young. When she does go, Arap Mining goes with her, and the baby is left with Situni. But the *shamba* is not so far away that Cepkumuren cannot hear the children if anything goes wrong.

855 604 The Dorobo elementary family might thus seem to be independent and self-contained. But it is not so really, and other relatives have a share in the upbringing of the children, not in spite of the parents' authority, but in support of it, and the relative who must be considered next to the parents from the Dorobo point of view is the father's brother, *papa*, who often lives in the same settlement, or if not, only a short distance away. This person, especially when he is an elder brother, has a position of authority over his brother's children at least equal to that of their father. His wife, a classi-

4:Huntingford E-5 (1938-1939) 1951 FL6 Dorobo FL6

the other hand, there should be no *ureriet*, just greeting and a minimum of conversation, as between strangers. The children of his wife's brother and sister are treated as his own. A woman regards her husband's brother and sister and their spouses much as he regards her brother and sister.

When the father's mother does not live with her son, she may perhaps be in the next settlement. She will then visit her grandchildren, and they will go to see her. This interchange of visits teaches children a good deal about the treatment of important people like grandmother. Interchange of visits with the mother's mother also takes place, especially when the man is getting older. Thus, Cesikirikat the mother of Arap Mining used to visit her daughter Cesunguny who was married to a *Nyongi* called Ngueses and had three sons. She would stay a few days with her daughter (during which time Ngueses would live in another hut) and then go home. Presently Cesunguny would bring her children to see Cesikirikat, and while the children were all still young (before they had reached puberty) they slept together in Cesikirikat's hut. After reaching puberty they slept in the *sikiroinet* with Arap Ruto. Girls visiting their father's mother sleep in her hut whatever their age.

Children are generally fond of their father's mother, partly because she makes it her business to be nice to them, "for they are the children of her child, and people do not hate their grandchildren". But if they do not visit her as often as she would like and bring her presents of food, she will be annoyed and shows her anger by saying, *Sere opeku lakocu ce mooipua omituakik* ("Peace, die you children who have not brought me food"), a curse which is not dangerous because it is neutralized by the word 'peace', and because she takes care to say it in the hearing of someone who will report it to the children, when some such conversation as this will take place:

Friend:	*Kaami kapkoko amut, konereket, amu maoipcin omituakik arauek ce cau, kocupok, kole, "Sere, opekun lakocu".*	I was at Grandmother's place yesterday, and she is angry because you have not brought her food for many months, and she cursed you and said, "Peace, die, you children".
Children:	*Woi, awendi ono, eiyo! Kokocupei koko, kole, "Sere, opekun".*	Alas! where shall I go, mother? Grandmother has cursed us and said, "Peace, die!"
Mother:	*Moomuen, lakocu, mawecok koko, kocamok, a mutai kipendi olinnyin si kiipcin melekto.*	Do not be afraid, children, grandmother does not hate you, she loves you; but to-morrow we will go to her place to take her a present.
Friend:	*Weiis, miye noto, si kocam koko.*	Yes, that's the best thing to do, so as to please grandmother.
Children:	*Weiis, kepe korun, . . . Kiipcin ne, si kocam?*	Yes, let's go to-morrow, . . . What shall we take her, so that she shall be pleased?
Mother:	*Kipendi korun, si kiipcin nyanyait ok lokomek.*	We'll go in the morning, and take her some meat and some honey and water.

l:Huntingford E-4, 5 (1938-1939) 1953 FL6 Dorobo FL6

other scavengers. Nowadays, all hunting activities are carried on illegally with the risk of being punished if caught by the police.

Weapons are the bow and poisoned arrows carried in a quiver. Knives are used to skin game and to make springes. Spears have never been used. The Dorobo used to have hunting dogs, but in the North Tindiret Forest the breed seems to have died out, though it existed in 1927. They have two kinds of trap: (i) The pit trap, *ngurei*, formerly used for buffalo, consisting of a pit 8 ft. long, 3 ft. wide, and 6 ft. deep, with wooden spikes set in the bottom. (ii) The springe or snare, *porousi*, which consists, briefly, of a springy stick bent over, with a noose attached to it connected with a platform: the arrangement is such that when an animal treads on the platform its head enters the noose, and the pressure on the platform releases the springy stick, which flies up, tightening the noose, and holding the animal suspended. Such traps can be made in less than ten minutes. This type is used chiefly to catch antelopes, but leopards have been caught in them. Cross-bar traps with a drop-spear were not used by the Kipkurerek Dorobo.

The only hunting taboo recorded is that the night before he goes out hunting a man must abstain from sexual intercourse. This does not apply to the setting of traps.

As regards land rights, the forest was divided into districts, *koret*, pl. *korosuek*, and in his district each man had an hereditary block of land in which he hunted, set traps, kept his honey-barrels, and collected wild food. Occupation rights were recognized by public opinion, and trespass on a man's forest area, i.e., deliberate entry in order to start hunting without permission or the promise of a piece of meat, might result in the trespasser's death at the hands of the owner, who would then have to pay compensation for homicide. Theft of game from a trap is said never to have occurred, not only because the thief might be killed, but because his belly would swell to a great size and he would die after eating meat stolen from a trap.

Bees

Honey is to the Dorobo what milk is to the Nandi: it is "sacred," and its supply must be protected by the observance of taboos. Fruit and blood must not be eaten on the same day as honey (though meat may be eaten); when a comb is emptied, it must be carefully hidden in the undergrowth; and after eating honey a Dorobo cleans his hands in earth, not (like the Nandi) by wiping them with leaves.

The Dorobo recognize four varieties of bee: *sekemik*, the honey-producing kind; *imeiik*, solitary bees which live in trees; *kosomek*, earth bees, which live in the ground; and *kiptulonik*, mason bees, which live in cells made of earth and particles of stone cemented together by their own saliva. The Dorobo divide the honey-bees, *sekemik*, into three kinds: the queen, *kamet ap sekemik*, "the mother of the bees"; the workers, called simply *sekemik*, considered to be males, which make honey by eating the "sap" (*pek*) of flowers and then vomiting it into the empty honey-combs; and the drones, *kapurenik*, considered to be idle females which do nothing useful.

Hives or honey-barrels (*pasanet*) are made either of slats of wood tied together, with circular wooden end-pieces; or of the two halves of a piece of log split longitudinally and tied together. They are set in trees, and when a new hive is put up, the owner calls the bees, in a high-pitched tone, to come and occupy it: "Bees, bees, from all the country, come here now, and pour in honey, pour in honey." Bees are said to recognize their owners by their body-smell, and do not sting them when taking honey. Certainly taking honey does not appear to be a painful or dangerous process to the Dorobo owner. Theft of honey from a barrel is considered very low, and a man might kill a thief, though he would have to pay compensation for homicide.

Honey is an important article in Dorobo economy: it is eaten as food, made into an intoxicant, used for ritual purification, and it forms an article of commerce.

9:Hobley G-S (ca. 1900) 1903 FL6 Dorobo FL6

They are said to be very prolific, having families of eight to ten children, but the infant mortality is so extremely heavy that their numbers increase very slowly: this mortality is probably due to the cold, damp climate of the Mau Forests, which are at an altitude ranging from 7,000 to 9,000 feet.

Their peace ceremony consists of cutting off a dog's ears, and the contracting parties then spatter one another with the blood.

They live principally on Colobus and other monkeys, which they shoot in the forest. At certain seasons, however, they go and hunt big game on the plains, known as the Rangata Nyuki; they wait till the grass is dry, and then burn it to facilitate their hunting. They use poisoned arrows for big game, and unpoisoned ones for monkeys, &c. They train dogs to assist in their hunting, and are very keen to get young dogs for the purpose. They told me that they first gave the dog certain medicine, and the animal could then track game.

They are very clever elephant hunters, and informed me that when they came across an elephant they went off and bathed and scrubbed themselves very carefully to remove all trace of the human scent, and that they were then able to approach a sleeping elephant and spear it with a poisoned dart.

They are most expert in the use of a firestick. The fire is produced in the ordinary way by the friction of one stick spun round vertically in a depression in another piece of wood, which is held firm between the bare feet of the operator; the lower piece of wood appeared to be the juniper of Man.

A small vocabulary of their language is appended on the opposite page. They use the Nandi numerals.

The prefix "ki," and the suffixes "et," "it," and "ek," are, I think, brought in from the Nandi language, but most of the roots will be found to be quite distinct. Many of the tribe can only speak Nandi, and when collecting this vocabulary in many cases they appeared to have forgotten the Oggiek or Omotik word but gave the Nandi word, and had to consult among themselves and, as it were, hunt up the proper word. The language is thus evidently dropping into such disuse that it will probably become quite extinct in the near future.

C. W. HOBLEY.

2: Maguire G-5 (ca. 1926) 1927-28
FL6 Dorobo FL6

enormously developed maxillary muscles. Individual physical peculiarities are not readily apparent when pigtails are almost universally grown and bodies are smeared with red ochre. The Nilotic peculiarity of standing on one leg has been observed in the *Mósiro*, but it is not seen so often as in the case of the Masai. I have been unable to discover any examples of pronounced steatopygia in the women, who are, usually, more prolific than the Masai women, and who are prized by the Masai for this reason. The *Mósiro* are a hardy race, and even at a comparatively advanced age the men retain great powers of activity and endurance.

The older generation (in common with the Masai elders) pays little attention to its personal appearance. *Mósiro* of a certain age would seem to be less under Masai influence than are the young men and are readily distinguishable from the Masai at first sight. (It might, perhaps, be as well to modify this by saying that an eye unaccustomed to looking on Masai will often fail to detect any difference between them and Dorobo of any type. Recently, I made the experiment of asking two Europeans from the coast to separate the Masai from the Dorobo in a mixed gathering. Each of them made a different selection and each of them was wrong in the majority of cases.)

In hunting, tracking, bush-lore and forest-craft the *Mósiroi* is, in my opinion, without equal when in familiar country. He seems to know instinctively what an animal will do under given circumstances, and inability to follow its track will seldom result in the pursuit being abandoned. If the ground is stony or if the passage of other animals has obliterated the trail, the *Mósiroi* will go quietly forward and will eventually, by a combination of luck, instinct and knowledge of the country and the habits of the quarry, pick up the spoor again. I have seen this happen many times. The *Mósiroi* knows when extreme caution must be observed and when noise does not matter; he is never at a loss for a vantage-point and, on the whole, is tenacious and plucky in the pursuit of dangerous game. He can summon lion to a kill by producing a weird, muffled, nasal cry (it is supposed to represent the bleating of a goat, though it has little resemblance to that noise, to my

FLÁ Dorobo FLÁ

differs little from that used by the Masai and many Bantu tribes. This axe is, primarily, a tool and not a weapon. They also carry the usual Masai club, which they call *rungu*'.[1] This club is used indiscriminately as a throwing or hitting weapon. The Dorobo are excellent shots with it, but are more expert with the bow. The latter weapon they seem to venerate; they are for ever holding archery competitions among themselves, and it is no uncommon sight to see a Dorobo dreamily twanging the taut string of his bow (often little shorter than himself) and deriving obvious pleasure from the sound produced thereby.

A skin bag or bottle, of the usual Masai pattern, is used to bring home honey collected in the bush. The Dorobo carry this, when full (the same remark applies to any other load), by means of a strap of bark or leather round the forehead. The load hangs between the shoulder-blades in the usual Masai fashion.

The *Mósiro* and *Ahamanik* Languages

(A comparative list of numerals, words and tenses, with the equivalents in Masai and Nandi.)

The following symbols or marks have been used to assist in the correct pronunciation of the numerals and the short lists of words and tenses given. They have also been used throughout the text. Most of them are used as in Hollis's well-known works on the Masai and Nandi.

The symbol ~ when superimposed denotes that the *ng* occurring in the word has the same sound as the English *singer*. In cases where it does not appear the *g* is hard.

A diæresis has its usual grammatical significance.

' denotes that the letter beneath it is definitely accented.

" denotes a long open vowel. *a* has been used in some words to denote an inimitable, long, drawling sound.

An elevated letter (as in *dale*) denotes that the letter in question is barely perceptibly sounded.

Where ^ appears over a vowel, it means that the letter has a

[1] This club is almost always made of the wood of a tree called by the Masai *Ol-oirien*. According to the authority quoted in Hollis, this tree is the wild olive (*Olea chrysophylla*). *Ol-oirien* may also mean the heart-wood of a tree (Hollis).

4:)Huntingford E-5 (1938-1939) 1953 FLA Dorobo FLA

father (if he lives nearby), to his brothers, and lastly, if there is any over, to his classmen in the settlement; so that a man who gets a pound or so of Nandi tobacco does not keep much of it for himself.

Drink, mainly in the form of honey-wine, is prepared not so much for private consumption as for social gatherings. It is used in various magico-religious performances, and as part of the bride-payment. When a man is visited by a friend or two, he gives them honey-wine; when there is a clan council, honey-wine is drunk; and when men and women meet for a wedding or a naming they drink honey-wine. It is thus an indispensable part of Dorobo social life. When a man wants to relax, he lies down and goes to sleep; but his amusement is composed of social gatherings. Visiting, ceremonials, and clan councils in fact provide him with his entertainment, and conversation and gossip seem to take the place of games and dances. I saw no sign whatever of the game called *kerwiek* by the Nandi, which is played with seeds or pebbles in holes in the ground or in a board, and never heard it mentioned. I neither saw nor heard of a dance, and I never once heard a Dorobo of either sex singing.

The principal standard of wealth is really a man's skill as trapper, hunter, and bee-keeper. But the products of this skill are perishable, and formerly the only way in which tangible wealth could be accumulated was in the form of weapons, honey-barrels, and dogs. Now that the old hunting conditions have gone, it is becoming possible for a man to accumulate wealth to a very limited extent in cattle or goats, which he can get by purchase, gift-exchange, or through bride-payment. The use of money has just become familiar, and a certain number of Dorobo earn wages; but except for one or two who have joined the Police, wages are not high, and the average in 1938 was 7 to 10 shillings a month. So far the Dorobo have had little inducement to work for wages, except that by signing on as squatters for a small wage they can acquire a temporary right to live on what was their own land. Beyond the fact that money enables them to buy a little extra food, our idea of wealth means little or nothing to them, and they have not yet advanced far enough into the transitional stage for it to be anything more than a small supplement to their traditional way of living. It is all that they can do to maintain themselves, let alone accumulate reserves or surplus wealth.

The transitional stage which the Dorobo had reached by 1939 is that from hunting to agriculture, with at the same time a strong desire to acquire cattle. It is sometimes suggested that hunting peoples like the Dorobo are really agriculturalists or pastoralists who have had to give up their agricultural or pastoral way of life and take to hunting. This may be true of some, such as the 'false Dorobo' in parts of Kenya who are merely outlaws and fugitives from various tribes. But it is quite clearly not true of the real Dorobo*, like those who form the subject of this paper, who are unmistakably non-pastoral and non-agricultural. Their basic hunting tendency is shown by their character and behaviour, by their hunting techniques and skill, by

* Cf. my remarks in *JRAI* 59. 1929. p. 378.

?: Weyland M-5 (ca. 1926) 1931 FLA Dorobo FL6

24/ [171] [132] have called one is termed *kuse ripp*. Planting is done in a season called *Lembweng*, when there are, or should be, light rains. This is well recognized, as are two other seasons or months: *Lemeu*, a time of rain; and *Lelokwin*, a time of much rain. A form of

The Calendar.—The Wandorobo are very hazy about the calendar, and disagree among themselves about it. The "year" appears to be divided into six months, of which the following lists were compiled from those who pretend to know about them. No two agree, it will be noticed, except 5 and 6, which are probably wrong, for my informants displayed much uncertainty. 105

1.	2.	3.	4.	5.
Lelokwe, *Lemeku,* *Lekwe,* *Lemeu,*	*Lembweng,* *Lelokwe,* *Lemeku,* *Lelokwin,* *Lemeu,*	*Lelokwe,* *Lembweng,* *Lemeku,* *Lelokwin,* *Lemeu,*	*Lelokwe,* *Lembweng,* *Lemeku,* *Lelokwin,* *Lemeu,*	*Lembweng,* *Lemeu,* *Lelokwin,* *Lembweng.*

Food.—In addition to the above-mentioned grain the Wandorobo will eat almost anything they can get their teeth into, but I do not gather that they will eat human flesh. They will devour any kind of antelope or pig, elephant, rhinoceros, etc., also carnivorous of all kinds, except the hyæna; nor do they eat chickens (the Dorobo say that this is because they—the Wandorobo—do not possess any) or snakes. Honey is greatly prized, and lion-traps are set for and with in the town. 262 [222]

Division of Labour.—A man's work, except during the hunting season, is wood cutting and attendance on the crops, where his main function is that of a scarecrow. During the hunting season all the able-bodied men leave the village in search of game, which they spear and trap. On wet ground they will actually run down a buck. When the harvests are cut, work in the fields and village is done by women, children, and old men. The boys help with the crops, and the girls are employed in the village grinding grain and fetching water with the women. The very old people sit about and take little active part in the life of the community. 462

Recreations.—The Wandorobo have no musical instruments. They rarely dance, and while the children doubtless play games I gathered no reliable information under this head.

● 517

Manufactures.—The Wandorobo are peculiarly wanting in this respect. They make neither baskets nor pottery. The former I did not see among them (the people were found to be using gourds as cooking pots). The latter is obtained from the Dorobo in exchange for tobacco. Their shields (*kwan*) are similarly obtained, while their spears (*kin*) come from the Dorlogo country, just over the border in the Sudan. It is noticeable that they use the short stabbing spear. These, it may be noted, are the only barbed spears I saw in Kavirondo. They are handmade (*sotchokwog*) of Dorobo origin; as with all other tribes in this part of the world, they carry their water in gourds, upon which they frequently carve crude designs. 430 [195] [213] [419] [411] [363] [531]

/235 cont./

411 322 [283] [237] with fat several times, it is bent over the fire. The string is plaited together, turning and braidlike, out of short animal tendons and is extended by further interweaving up to the required length. The projecting starting-ends of the individual pieces of tendon are neatly cut off, whereupon one then rubs the new finished bowstring with some fat.

The arrow shaft (Fig. 94) is carved out of a dry wooden stick, first rounded, then smoothed by scraping. The upper end is wound [237] [324] [412] with tendons that have been coated with the varnishlike juice of a not yet described species of gladiolus known as dirit, whereupon, on top, one drills in the one- /236/ /Figs. 93 and 94 appear here/ 411 centimeter-long hole for the tang of the arrow by a twirling motion [237] with a thin wooden chisel. At the lower end the three-part feather- [136] ing -- one of the feathers of the carrion vulture (Neophron percnopterus) -- is first fastened on by being wrapped with a very fine [283] [324] bast thread and then glued fast with the gladiolus juice just mentioned. Another wrapping of animal tendons is found between the feathering and the rear notch for the bowstring, in order to prevent a splitting of the shaft.

[325] [322] [191] [439] The people buy the iron points; only if a point breaks off /237/ do they as a rule forge a new one for themselves. Clubs are carved from a piece of wood, as among the Masai. They buy the spears, of which there are one or more in almost every camp, from the blacksmiths of the Masai. The spears serve as weapons only in the camp, where shooting with arrows is not permitted, on account of the danger connected with that, since they are always poisoned.

415 439 [285] The Asa for the most part buy wooden bowls and gourd bottles from sedentary tribes. On the other hand, in some places they plait shallow baskets, which they use for storing food.

524 820 191 The fact that the Wandorobo do not play the board game so popular among the Masai was explained to me by them with the words: "During the game we would forget to hunt and then, with our families, would have to starve."

512 517 With the coming of darkness complete stillness as a rule comes over the camps, quiet even during the day; the day's work is done and everyone goes to his hut. Only on moonlit evenings do the old [273] [535] [533] people often still sit in the open for a few hours, talking, with a gourd bottle of honey beer, while the young men and girls dance and let their falsetto song ring out through the still night. From

[TEXT CONTINUED ON PAGE 313]

/337 cont./
which now and then, as though as an answer, the cry of a predatory animal resounds over to them. The dance differs from that of the Masai through the fact that the men do not lift their feet, but only raise their heels. The narrow, twisted plaza of the camp permits only dancing on the spot. Just as there, here too it is accompanied each time by song.

533 In a falsetto (1)

[24]

1. Recorded by Hans Stabsarzt /staff physician/ Dr. Skrodzki.

the tone, just barely reachable, roughly the A above middle C (sometimes stricken), is strongly accented and shrilly sung out. In an extremely irregular beat the succession of tones now descends in the six-four / $\frac{6}{4}$ / chord of A. At the A below middle C the chest tone sets in, but relatively softer than the falsetto, until, descending in the same degrees of the scale, the second A below middle C is reached. The final tones are more certain, because they lie better for the singer; the falsetto usually hovers around the tone sought, in part uncertainly, in part playfully.

Appoggiaturas, triplets are repeated all the more frequently the more certain the artist gradually feels in adhering to the melody -- sit venia verbi /so to speak/. No other figures are observed. Finally the voice once more glides within the seventh chord up and down the last octaves; or the fundamental tone is phrased in contrapuntal fashion at the end. The entire song is an irregular variation of a six-four / $\frac{6}{4}$ / chord. It is limited almost entirely to two octaves. Through the greater probability of being hit properly the fundamental tones of the chord form the natural rest points for the voice and may sometimes be interpreted as strong parts of the measure. In marching they coincide with the putting down of one foot. Nevertheless there is not any sort of time that can be observed. The delivery is often parlando, and the tempo also corresponds to this style. The fact that the /334/ text is arranged ad libitum /at will/ for each one heightens the interest, if not the musical enjoyment, of the listeners.

6:Huntingford E-5 (1938-1939) 1953 FL6 Dorobo FL6

barrel so that the smoke goes inside and the bees come out. He then takes out what honey he wants, wraps it in the leaves he has brought, and descends, carefully extinguishing the tinder when he has reached the ground. Though sometimes the barrels are not more than a few feet from the ground, very often the process of taking honey means a climb of eighty feet or so with no help but the unsteady ladder already described.

Although honey has great ritual and social value, like milk to the Nandi, it cannot be said that bees take the place of cattle in the daily life of the people, for they require and receive no care beyond the provision of barrels and the due observance of the taboos concerning honey, and there is really no need to know very much about them. But as producers of honey, bees provide material for food, drink, and ritual, and they are thus of some importance. Honey, too, is a much-used medium of exchange. Without honey, Dorobo life would be vain and empty.

b) Hunting

In the past, hunting was the chief occupation of Dorobo men, and though they hunt but little now, confining their activities to trapping, they have still a "hunting outlook". The conversation of Dorobo walking through the forest sooner or later turns on the animal life around them, for as we have already noted, they have what the Nandi call *comiet*, which one might almost render 'affinity', with the beasts of the forest. The sort of talk that goes on in the forest is something like this sample, which I took down after hearing it :

A. *Keliek ap tiowik.*
The-feet of the-animals.

B. *Iro, ni poinet, punu yo, wendi yo.*
Look, this-one (is) the-bushbuck, it-comes-from over-there, it-goes over-there.
Miniu, a ma miniu misiu, tinye lakuennyi kitekin.
Small, but not small very, it-has its-child small.

A. *Cecok cuto tiomik, mii samaktannyon; acome cepo samak.*
(They are) ours these animals, they-are-in our-forest; I-like (the things) which-are-of forest.

B. *Ingeswoen ulinto timin, apēre mii tiond ake. Ne ni ne kuikuioti orūl?*
Let-us-look over-there (in) that-forest, perhaps there-is the-animal another. What (is) this that creeps-about inside?

A. *Apēre tumta.*
Perhaps the-giant-pig.

B. *Weiis, asuweni metit. Inguatinye kuyanda apēre no. A mamii kuyanda.*
Yes, I-see the-head. If-I-had the-bow I-kill that-one. But there-is-not-here the-bow.

A. *Ingeswoen ole mwe.*
Let-us-see where it-escapes-(to).

supported the roof with his fore-paws, for he had no tusks. Whereupon the wart-hog said: 'You are stronger than me. Hold up the roof with all your might while I run out for some timber to prop it up.' The lion, flattered, agreed, and the wart-hog ran out and quickly made his escape."

(History does not relate how long the lion remained holding up the roof before he realised that he had been duped by the cunning wart-hog. This story is very popular and is always received with roars of laughter.)[1]

D [522]

The Dorobo plays the part of buffoon or low comedian in many Masai folk-tales.[2] The Dorobo themselves are well aware of this and regard it as a huge joke. A tale told by a Masai in which a Dorobo figures in an absurd light generally elicits hearty applause from the Dorobo present. I select the following example.

M 539 829

The Dorobo and the Cow.—The Dorobo is an impatient man. Once he was given a cow, and some days afterwards this cow was crossed by a bull. The Dorobo waited a month. Then he waited another month. He tried to milk the cow, but no milk would come. He thereupon said: "What sort of a cow is this? It will not give birth; it has no milk; it is altogether unsatisfactory." He then went away to sleep, saying: "Perhaps it will have given birth by the time it is morning." In the morning, all was as it had been before and the efforts of the Dorobo to milk the cow met with no more success. The Dorobo, who was determined at least to obtain milk, thereupon seized his knife and split up the cow's udder (for all Dorobo are impatient men), but no milk came, and his knife penetrating too deeply, the intestines of the cow fell out and it died. The Dorobo was very surprised and said: "This is a bad kind of cow and I do not understand it." He then proceeded to eat the meat until it was all finished.

M 539

D 171 538

I was surprised to discover so little resemblance between *Mósiro* folk-lore and folk-tales and those of the Nandi as given in Sir Claud Hollis's book. There is more affinity between the *Mósiro* and the Masai in this respect. This may perhaps be explained by the comparatively long period the *Mósiro* must

[1] [Some Bantu tribes tell it of the Hare.—A. W.]
[2] For further examples of this see Hollis.

4:Huntingford E-5 (1938-1939) 1951 FL6 Dorobo FL6

Between a man and the members of his own generation considerable latitude is allowed. As the Dorobo put it, *Kicupekei, kiurerencinkei, kiilencinkei, 'Kumin kon, ngut kum kamat', amu ki lakok.* ("We use bad language to one another, we play together, we say to each other, 'May your father lie with you, or may you lie with your mother', because we are children", i. e. we are all of the same age.) These rude phrases, however, must never be used to elders, and to do so is very shameful; but spoken to members of one's own age-set or generation they are quite harmless and have no sinister implications. Between the sexes of the same generation there may be a perfectly innocuous intimacy, between brother and sister, between *macokor, mama,* and *kesenda,* which allows any kind of joking and language but stops short of actual sexual intercourse; and in spite of this license, such evidence as there was indicated that incest was not common. Between members of the same generation, especially in youth and early middle age, there is also a strong bond in the shape of mutual help and support among those who live near each other, extending to all departments of home life. The effect of propinquity must not be overlooked, and the claims of even a close relative who lives a long way off and is seldom seen may be reduced to insignificance.

The general attitude of a man's own children to the children of his *macokor,* his *mama,* and his *kesenda,* is the same, in that they are all like his own children, who may be played with or reproved when necessary, but without the use of any bad language or abuse. To those children to whom he is 'father's brother' there is of course the special attitude that I have already described. But between members of this generation there is a marked terminological difference:

so that by classification all the children on the father's side are *macokor,* while those on the mother's side are both *mama* and *kesenda*; and a man's own children are *apaa,* while those of his sister are *mama.* When the children are small these differences are merely nominal and not apparent; but as they grow older a distinction tends to arise between those on the father's side and those on the mother's side, especially between *macokor* and *mama*; and this is emphasized by the possibility that a man might marry his *macokor* (father's sister's daughter's daughter), even if he seldom or never does so in fact.

Between a man and the second descending generation there is a relationship of respect, for terminologically his grandchildren are equated with his grandfather. In practice, however, this generation counts as far as he

6:Huntingford E-5 (1938-1939) 1953 FL6 Dorobo FL6

father (if he lives nearby), to his brothers, and lastly, if there is any over, to his clansmen in the settlement ; so that a man who gets a pound or so of Nandi tobacco does not keep much of it for himself.

Drink, mainly in the form of honey-wine, is prepared not so much for private consumption as for social gatherings. It is used in various magico-religious performances, and as part of the bride-payment. When a man is visited by a friend or two, he gives them honey-wine ; when there is a clan council, honey-wine is drunk ; and when men and women meet for a wedding or a naming they drink honey-wine. It is thus an indispensable part of Dorobo social life. When a man wants to relax, he lies down and goes to sleep; but his amusement is composed of social gatherings. Visiting, ceremonials, and clan councils in fact provide him with his entertainment, and conversation and gossip seem to take the place of games and dances. I saw no sign whatever of the game called *kecuiek* by the Nandi, which is played with seeds or pebbles in holes in the ground or in a board, and never heard it mentioned. I neither saw nor heard of a dance, and I never once heard a Dorobo of either sex singing.

The principal standard of wealth is really a man's skill as trapper, hunter, and bee-keeper. But the products of this skill are perishable, and formerly the only way in which tangible wealth could be accumulated was in the form of weapons, honey-barrels, and dogs. Now that the old hunting conditions have gone, it is becoming possible for a man to accumulate wealth to a very limited extent in cattle or goats, which he can get by purchase, gift-exchange, or through bride-payment. The use of money has just become familiar, and a certain number of Dorobo earn wages ; but except for one or two who have joined the Police, wages are not high, and the average in 1939 was 7 to 10 shillings a month. So far the Dorobo have had little inducement to work for wages, except that by signing on as squatters for a small wage they can acquire a temporary right to live on what was their own land. Beyond the fact that money enables them to buy a little extra food, our idea of wealth means little or nothing to them, and they have not yet advanced far enough into the transitional stage for it to be anything more than a small supplement to their traditional way of living. It is all that they can do to maintain themselves, let alone accumulate reserves or surplus wealth.

The transitional stage which the Dorobo had reached by 1939 is that from hunting to agriculture, with at the same time a strong desire to acquire cattle. It is sometimes suggested that hunting peoples like the Dorobo are really agriculturalists or pastoralists who have had to give up their agricultural or pastoral way of life and take to hunting. This may be true of some, such as the 'false Dorobo' in parts of Kenya who are merely outlaws and fugitives from various tribes. But it is quite clearly not true of the real Dorobo [7], like those who form the subject of this paper, who are unmistakably non-pastoral and non-agricultural. Their basic hunting tendency is shown by their character and behaviour, by their hunting techniques and skill, by

[7] Cf. my remarks in JRAI 59. 1929. p. 378.

/235 cont./

411 322 [283] [237] with fat several times, it is bent over the fire. The string is plaited together, turning and braidlike, out of short animal tendons and is extended by further interweaving up to the required length. The projecting starting-ends of the individual pieces of tendon are neatly cut off, whereupon one then rubs the now finished bowstring with some fat.

The arrow shaft (Fig. 84) is carved out of a dry wooden stick, first rounded, then smoothed by scraping. The upper end is wound [237] [824] [412] with tendons that have been coated with the varnishlike juice of a not yet described species of gladiolus known as diriee, whereupon, on top, one drills in the one- /236/ /Figs. 83 and 84 appear here/ 411 centimeter-long hole for the tang of the arrow by a twirling motion [237] with a thin wooden chisel. At the lower end the three-part feather- [136] [283] ing -- out of the feathers of the carrion vulture (Neophron percnopterus) -- is first fastened on by being wrapped with a very fine [824] bast thread and then glued fast with the gladiolus juice just mentioned. Another wrapping of animal tendons is found between the feathering and the rear notch for the bowstring, in order to prevent a splitting of the shaft.

[325] [322] [171] [439] The people buy the iron points; only if a point breaks off /237/ do they as a rule forge a new one for themselves. Clubs are carved from a piece of wood, as among the Masai. They buy the spears, of which there are one or more in almost every camp, from the blacksmiths of the Masai. The spears serve as weapons only in the camp, where shooting with arrows is not permitted, on account of the danger connected with that, since they are always poisoned.

415 [439] [285] The Asa for the most part buy wooden bowls and gourd bottles from sedentary tribes. On the other hand, in some places they plait shallow baskets, which they use for storing food.

524 829 171 The fact that the Wandorobo do not play the board game so popular among the Masai was explained to me by them with the words: "During the game we would forget to hunt and then, with our families, would have to starve."

512 517 With the coming of darkness complete stillness as a rule comes over the camps, quiet even during the day; the day's work is done and everyone goes to his hut. Only on moonlit evenings do the old [273] people often still sit in the open for a few hours, talking, with a [535] gourd bottle of honey beer, while the young men and girls dance [533] and let their falsetto song ring out through the still night, from

[TEXT CONTINUED ON PAGE 313]

FL6 Dorobo FL6

differs little from that used by the Masai and many Bantu tribes. This axe is, primarily, a tool and not a weapon. They also carry the usual Masai club, which they call *rungu*'.[1] This club is used indiscriminately as a throwing or hitting weapon. The Dorobo are excellent shots with it, but are more expert with the bow. The latter weapon they seem to venerate; they are for ever holding archery competitions among themselves, and it is no uncommon sight to see a Dorobo dreamily twanging the taut string of his bow (often little shorter than himself) and deriving obvious pleasure from the sound produced thereby.

A skin bag or bottle, of the usual Masai pattern, is used to bring home honey collected in the bush. The Dorobo carry this, when full (the same remark applies to any other load), by means of a strap of bark or leather round the forehead. The load hangs between the shoulder-blades in the usual Masai fashion.

The *Mósiro* and *Aramanik* Languages

(A comparative list of numerals, words and tenses, with the equivalents in Masai and Nandi.)

The following symbols or marks have been used to assist in the correct pronunciation of the numerals and the short lists of words and tenses given. They have also been used throughout the text. Most of them are used as in Hollis's well-known works on the Masai and Nandi.

The symbol ~ when superimposed denotes that the *ñg* occurring in the word has the same sound as the English *singer*. In cases where it does not appear the *g* is hard.

A diaeresis has its usual grammatical significance.

´ denotes that the letter beneath it is definitely accented.

¯ denotes a long open vowel. *ee* has been used in some words to denote an inimitable, long, drawling sound.

An elevated letter (as in *dalo*[t]) denotes that the letter in question is barely perceptibly sounded.

Where ^ appears over a vowel, it means that the latter has a

[1] This club is almost always made of the wood of a tree called by the Masai *Ol-oirien*. According to the authority quoted in Hollis, this tree is the wild olive (*Olea chrysophylla*). *Ol-oirien* may also mean the heart-wood of a tree (Hollis).

1: Huntingford E-4, 5 (1938-1939) 1953 FL6 Dorobo FL6

legs straight and hands crossed on the breast. Babies are also laid out for the hyenas, though if there is a dung-heap, they are buried there.

Witchcraft

Witches, *powik* (defined as among the Nandi, p. 39), may be of either sex; females are said to be more common, though in 1939 the Dorobo said there were no witches at all in the three districts of Kelpui, Kipkorom, and Soeoiyo, and certainly no trace of witchcraft was encountered. Formerly, in cases of witchcraft where the witch's identity was unknown, the Dorobo went to a Nandi diviner, *sakeyuot*, and on her identity becoming known the witch was required to oil the victim on the face, breast, and belly with the fat of a she-goat. If she refused, she was tied to a tree by a thong drawn tightly round her forehead and flogged till she agreed.

Affinity with Wild Animals

Possessing a "hunting outlook," the attitude of the Dorobo to wild animals is unlike that of the African to whom hunting is at most of secondary importance. They seem to be closer to the wild life round them, perhaps because they are wild men themselves. The conversation of Dorobo going through the forest turns quickly to the wild life there, for they have what they and the Nandi call *comiet*, "affinity," with the beasts of the forest. This was described in a text, in which a Dorobo said: "The Dorobo know the spoor of all the animals, and they like to see the animals. The animals are not bad, for we and they all dwell in the forest together. The intelligence of animals is not like that of people, but it is not very different, for animals also are intelligent. All animals of the forest are alike, though we eat some and not others, because we the Dorobo and they the animals all live side by side in the forest."

Musical Instruments

The Dorobo have no musical instruments, and they seldom sing or dance. They used to have water-buck horns which were blown to call people together in the forest.

2: Maguire G-5 (ca, 1926) 1927-28
FL6 Dorobo FL6

411 [386] through use and continuous contact with hands and bodies which are frequently anointed with *Ol-hâria*.[1]

[237] The bowstring (*inet*) is made from the sinew embedded in the dorsal muscles of an ox, eland, greater kudu or hartebeest. Occasionally it may be manufactured from the tendon of a giraffe's leg.

[415] The quiver (*mootisi*)[2] is a cylinder of ox-, eland- or kudu-skin about two-and-a-half feet in length and capable of containing from fifteen to thirty arrows. A strap runs down one side and is attached to the removable cap. When this cap is put on, the strap, taut over the wearer's shoulder, keeps it in place. The quiver is the same in all respects as that used by the Masai, and an illustration of it will be found on p. 356 of *The Masai; their Language and Folklore* (Hollis).

The arrows (*hâtik*; sing. *hâte*) vary in length according to the size of the owner. They are generally between twenty and thirty inches long. Many kinds of wood are used for the making of the arrow-shaft (*muliandoi*). The arrow-head (*sipalda*), which is made from any scraps of iron that can be obtained (since the decline of the *Il-Kunôno*,[3] no iron is smelted in Tanganyika Masailand, and swords and spears are made, almost exclusively, by the Chaga and the Wanguu), consists of a single barb. The hole bored in the shaft to receive it is reinforced with sinew (*Mâisie*) from the leg of an ox. This is bound round the aperture, and then the work is smeared with a kind of gum (*itî*) obtained from the *Ñgoisiandoi*[4] tree. The arrow feathers are those of the vulture (*Arat'chot*) or the long-legged insect-eating bird called *Endera'hi*. The feathers are bound to the shaft with thin gut and the whole (including the nock) is then coated with a sticky paste obtained by chewing a tuber (*sikôitie*). This paste is smeared on and allowed to dry in the sun, when the result is surprisingly strong and well-knit.

[531] Dorobo arrows are workmanlike and extremely strong, but they are seldom if ever embellished or ornamented in any way.

The arrow-head is generally (when coated with fresh poison)

FLÁ Dorobo FLÁ

difficult matter to explain how the *Méoiro* of Talamai penetrated so far south—assuming them to have been Nandi originally. In addition to the other points of resemblance between the *Méoiro* and the Nandi that may have been noted throughout this paper, it may be of interest to state that the *Méoiro* possess and use a four-stringed lyre[1] of much the same shape and construction as that illustrated on p. 39 of Sir Claud Hollis's work on the Nandi. The *Méoiro* are skilful performers on this lyre, which is quite foreign to the Masai. The other Nandi musical instruments (with the exception of the war-horn) are not known to the *Méoiro*, as far as I have been able to discover.

I have said elsewhere that the bulk of the Kenya Dorobo would seem (according to the statements made by the Dorobo from whom the present information has been derived) to be *Aramanik* and *Balaidga*. This was with reference to the Dorobo living among the Kenya Masai and was not intended to include such Dorobo as there may be among the Nandi to-day.

On one occasion I was lured to walk over twenty miles by the promise of being shown some "rock-paintings" alleged to have been made by the *Méoiro* or other Dorobo and to be extremely ancient. My informant assured me that no man could remember the time when they had been done and that the cave in which they were was regarded with great reverence throughout the countryside. I went, only to discover that the place was a disused *Ol-ḳal* and that the paintings (most of them were of Masai shields, but some were of a character bordering on the lascivious) had obviously been made by Dorobo or Masai Muran within the last five years or so.[2] Some were even fresher. Charcoal, red ochre, lime and wood-ash were the mediums used.

To the casual observer (particularly one new to Africa) the Dorobo, Masai, Kwavi, Gogo and even the Arusha warrior when in panoply might all seem to belong to the same tribe. To the habituated eye there would be many differences readily

[1] *Kipukander* (Nandi); *Hamshi* (*Méoiro*).

[2] When the Masai Muran go into *Ol-ḳal*, they are often accompanied by one or more Dorobo, generally *Méoiro*. The duties of the latter are to plait the Masai warriors' hair, cook and make themselves generally useful. Their reward is as much meat as they can consume.

294 [371] [132] have called one is termed *Inap rope*. Planting is done in a season called *Lenkoiong*, when there are, or should be, light rains. This is well recognized, as are two other seasons or months: *Lemeu*, a time of rain; and *Lenkatu*, a time of much rain. A form of

305 *The Calendar.*—The Wandorobo are very hazy about the calendar, and disagree among themselves about it. The "year" appears to be divided into six months, of which the following lists were compiled from those who pretend to know about them. No two agree, it will be noticed, except 3 and 4, which are probably wrong, for my informants displayed much uncertainty.

1.	2.	3.	4.	5.
Lenkoiye,	*Lenkoiong,*	*Lenkoiye,*	*Lenkoiye,*	*Lenkoiong*
Lemeiki,	*Lenkoiye,*	*Lenkoiong*	*Lenkoiong*	*Lemeu,*
Lekwe,	*Lemeiki,*	*Lemeiki,*	*Lemeiki,*	*Lenkatu,*
Lemeu,	*Lenkatu,*	*Lenkatu,*	*Lenkatu,*	*Lenkoiye.*
?	*Lemeu,*	*Lemeu,*	*Lemeu,*	*?*
?	*?*			

262 [722] *Food.*—In addition to the above-mentioned grain the Wandorobo will eat almost anything they can get their teeth into, but I do not gather that they will eat human flesh. They will devour any kind of antelope or pig, elephant, rhinoceros, etc., also carnivorous of all kinds, except the hyæna; nor do they eat chickens (the Dorobo say that this is because they—the Wandorobo—do not possess any) or snakes. Honey is greatly prized, and locusts are eat raw and wild in the bush.

462 *Division of Labour.*—A man's work, except during the hunting season, is wood cutting and attendance on the crops, where his main function is that of a scarecrow. During the hunting season all the able-bodied men leave the village in search of game, which they spear and trap. On wet ground they will actually run down a buck. When the hunters are out, work in the fields and village is done by women, children, and old men. The boys help with the crops, and the girls are employed in the village grinding grain and fetching water with the women. The very old people sit about and take little active part in the life of the community.

577 *Recreations.*—The Wandorobo have no musical instruments. They rarely dance, and while the children doubtless play games I gathered no reliable information under this head.

639 [787] [913] [619] [411] [852] *Manufactures.*—The Wandorobo are peculiarly wanting in this respect. They make neither baskets nor pottery. The former I did not see among them (the people were found to be using gourds as cooking pots). The latter is obtained from the Dorobo in exchange for tobacco. Their skirts (*kanu*) are similarly obtained, while their spears (*kiti*) come from the Dorobo country, just over the border in the Sotek. It is noticeable that they use the short stabbing spear. These, it may be noted, are the only tanged spears I saw in Kenyasia. They use headrests (*orkidokuap*) of Dorobo origin; as with all other tribes in this part of the world, they carry their water in gourds, upon which they frequently carve crude designs.

[531]

/Plate xxxv./

302 371 412 304 [284] manner as among the Masai, but here the eyebrows are also shaved by both sexes. The nails are cut with an ordinary two-edged knife. The two middle lower incisors are not broken out for everyone. Hair and nail cuttings are thrown away or hidden at some distance from the kraal, so that they will not fall into the hands of an evil sorcerer, who would be able to make from them sorcery leading to a sickness for their former owners.

Fig. 87.

The young men and girls color their entire bodies with a paint made out of fat and red earth (ol gorio), or the former also only legs and lower arms, and then wipe off the color again in serpentine lines (ngai) that run parallel an inch apart. After killing an elephant the happy hunter paints his chest with three lines, the two outer ones of which go from the collarbone over the nipples to the hips, the middle one from the chest to the navel (Fig. 87), or they paint

302 531 [286]

[291]

their whole bodies, with the exception of the abdomen, with white and red stripes (like the Masai warriors). The former painting they call kewilirik, the latter they designate with the Masai word ol gilalgwet. At feasts the men draw a line with the powder of sengelgera - ochre, from the upper lip upward over nose and forehead to the hairline. Boys (Fig. 88) and girls (Fig. 89) tattoo the lyre figure /Fig/ of the Masai, the latter also another similar one on the abdomen. Not infrequently one also finds on the face of the women the ochred-in of hipper design, which has been discussed for the Masai.

[292]

304 [285]

/310 cont./

789 outside the camp in the steppe, or must leave a slain piece of game /781/ outside during the night, they walk around the spot, before the approach of darkness, with a burning twig of the mendeja bush. They assert that if one has done this, no predatory animal can approach.

On the bow end held diagonally upward in shooting, one frequently finds a design like a money box, which, in the belief of the people, God himself taught them long ago, and which is supposed to have the effect that in hunting they will kill only fat game.

The nature of the sorcery through which sickness and death can be brought about they explain like the Masai. Evil, supernatural spirits have nothing to do with it. It is solely the work of evil human beings, who are despised, feared, and therefore expelled: they are called mbonono, in which one recognizes the Masai word ol emonotoni. Persons with the evil eye, who are called gallagumma, are likewise hated and expelled. If one knows no natural cause for an illness or a sudden death, it is regarded as the work of these sorcerers.

XV.

600 Law. -- General remarks. -- Property. -- Sharing the hunting booty. -- Things found. -- Barter. -- Debts. -- Liability. -- Gift. -- Blood friendship. -- Murder and manslaughter. -- Negligent homicide. -- Bodily injury. -- Immoral offenses. -- Theft. -- Inquiry about an unknown culprit. -- Legal procedure. -- Swearing. -- Torture. -- Ordeals. -- Blur test. -- Woman before justice. -- Mentally ill.

671 The legal views and legal practices of the Asá in general resemble
171 those of the Masai.[1] We find the same leading ideas everywhere. Here, too, might often comes before right, even if not to the same extent as there.

672 There is nothing new to be said about the rights of families and
(614) persons. The sole court in litigation is a respected man chosen by
both parties. If plaintiff and defendant belong to the same tribe.
(615) litigation or criminal cases in which plaintiff and defendant belong to two different tribes are not settled by the Wandorobo among themselves, but handed over to the Masai of the nearest kraal for settlement. A prosecution of punishable offenses by legal steps is unknown.

1. [For information on legal views of the Masai, see FLI2 Masai, 18Merker, category 116, pp.279-291--Analyst]

father (if he lives nearby), to his brothers, and lastly, if there is any over, to his clansmen in the settlement; so that a man who gets a pound or so of Nandi tobacco does not keep much of it for himself.

Drink, mainly in the form of honey-wine, is prepared not so much for private consumption as for social gatherings. It is used in various magico-religious performances, and as part of the bride-payment. When a man is visited by a friend or two, he gives them honey-wine; when there is a clan council, honey-wine is drunk; and when men and women meet for a wedding or a naming they drink honey-wine. It is thus an indispensable part of Dorobo social life. When a man wants to relax, he lies down and goes to sleep; but his amusement is composed of social gatherings. Visiting, communicle, and clan councils in fact provide him with his entertainment, and conversation and gossip seem to take the place of games and dances. I saw no sign whatever of the game called *kewisk* by the Nandi, which is played with seeds or pebbles in holes in the ground or in a board, and never heard it mentioned. I neither saw nor heard of a dance, and I never once heard a Dorobo of either sex singing.

The principal standard of wealth is really a man's skill as trapper, hunter, and bee-keeper. But the products of this skill are perishable, and formerly the only way in which tangible wealth could be accumulated was in the form of weapons, honey-barrels, and dogs. Now that the old hunting conditions have gone, it is becoming possible for a man to accumulate wealth to a very limited extent in cattle or goats, which he can get by purchase, [illegible] familiar, and a certain number of Dorobo earn wages; but except for one or two who have joined the Police, wages are not high, and the average in 1939 was 7 to 10 shillings a month. So far the Dorobo have had little inducement to work for wages, except that by signing on as squatters for a small wage they can acquire a temporary right to live on what was their own land. Beyond the fact that money enables them to buy a little extra food, our idea of wealth means little or nothing to them, and they have not yet advanced far enough into the transitional stage for it to be anything more than a small supplement to their traditional way of living. It is all that they can do to maintain themselves, let alone accumulate reserves or surplus wealth.

The transitional stage which the Dorobo had reached by 1939 is that from hunting to agriculture, with at the same time a strong desire to acquire cattle. The projecting starting-ends of the individual pieces of tendon are neatly cut off, whereupon one then rubs the now finished bowstring with some fat.

The arrow shaft (Fig. 84) is carved out of a dry wooden stick, first rounded, then smoothed by scraping. The upper end is wound [297] [124] [412] with tendons that have been coated with the varnishlike juice of a not yet described species of gladiolus known as dirit8, whereupon, on top, one drills in the one- /316/ /Figs. 83 and 84 appear here/ 411 centimeter-long hole for the tang of the arrow by a twirling motion [239] with a thin wooden chisel. At the lower end the three-part feather- [136] ing -- out of the feathers of the carrion vulture (Neophron percnopterus) -- is flat fastened on by being wrapped with a very fine [283] [824] bast thread and then glued fast with the gladiolus juice just mentioned. Another wrapping of animal tendons is found between the feathering and the rear notch for the bowstring, in order to prevent a splitting of the shaft.

[825] [322] [171] [439] The people buy the iron points only if a point breaks off /321/ do they as a rule forge a new one for themselves. Clubs are carved from a piece of wood, as among the Masai. They buy the spears, of which there are one or more in almost every camp, from the blacksmiths of the Masai. The spears serve as weapons only in the camp, where shooting with arrows is not permitted, on account of the danger connected with that, since they are always poisoned.

415 [439] [285] The Asa for the most part buy wooden bowls and gourd bottles from sedentary tribes. On the other hand, in some places they plait shallow baskets, which they use for storing food.

[324] [439] [171] The fact that the Wandorobo do not play the board game so popular among the Masai was explained to me by them with the words "During the game we would forget to hunt and then, with our families, would have to starve."

512 [517] With the coming of darkness complete stillness as a rule comes over the camps, quiet even during the day; the day's work is done and everyone goes to his hut. Only on moonlit evenings do the old [273] [516] people often still sit in the open for a few hours, talking, with a gourd bottle of honey beer, while the young men and girls dance [583] and let their falsetto song ring out through the still night, from

[TEXT CONTINUED ON PAGE 313]

512 /237 cont./
512 which now and then, as though as an answer, the cry of a predatory
[223] animal resounds over to them. The dance differs from that of the
[535] Masai through the fact that the men do not lift their feet, but only
[533] raise their heels. The narrow, twisted plaza of the camp permits
535 only dancing on the spot. Just as there, here too it is accompanied
121 each time by song.
[32 1]
533 In a falsetto (1)

[126] 1. Recorded by Herr Stabsarzt /Staff physician/ Dr. Skrodzki.

the tone, just barely reachable, roughly the A above middle C (sometimes stricken), is strongly accented and shrilly sung out. In an extremely irregular beat the succession of tones now descends in the six-four / $\frac{6}{4}$ / chord of A. At the A below middle C the chest tone sets in, but relatively softer then the falsetto, until, descending in the same degrees of the scale, the second A below middle C is reached. The final tones are more certain, because they lie better for the singer; the falsetto usually hovers around the tone sought, in part uncertainly, in part playfully.

Appoggiaturas, triplets are repeated all the more frequently the more certain the artist gradually feels in adhering to the melody -- sit venia verbi /so to speak/. No other figures are observed. Finally the voice once more glides within the seventh chord up and down the last octave; or the fundamental tone is phrased in contrapuntal fashion at the end. The entire song is an irregular variation of a six-four / $\frac{6}{4}$ / chord. It is limited almost entirely to two octaves. Through the greater probability of being hit properly the fundamental tones of the chord form the natural rest points for the voice and may sometimes be interpreted as strong parts of the measure. In marching they coincide with the putting down of one foot. Nevertheless there is not any sort of time that can be observed. The delivery is often parlando, and the tempo also corresponds to this style. The fact that the /226/ text is arranged ad libitum /at will/ for each use heightens the interest, if not the musical enjoyment, of the listeners.

/238 cont./

539 533 An overheard text is: "If I were a bird that is sitting beside the river and a zebra came to drink, I would, in the little bird's place, kiss (or bite) it, because I love it very much. But I am big and therefore can not."

512 Around ten o'clock at the latest the merriment reaches its end, and the camp is finally wrapped in silence.

825 The statement of the Wandorobo, according to which it is still supposed to have never happened that human beings have been killed by predatory animals within the camp seems remarkable. They [189] therefore do not fear them at all and believe themselves safe from them because of their magic medicines, some of which, according to popular belief, keep the wild animals far away, while others have the effect of the cap of invisibility.

difficult matter to explain how the *Mósiro* of Talamai penetrated so far south—assuming them to have been Nandi originally. In addition to the other points of resemblance between the *Mósiro* and the Nandi that may have been noted throughout this paper, it may be of interest to state that the *Mósiro* possess and use a four-stringed lyre [1] of much the same shape and construction as that illustrated on p. 39 of Sir Claud Hollis's work on the Nandi. The *Mósiro* are skilful performers on this lyre, which is quite foreign to the Masai. The other Nandi musical instruments (with the exception of the war-horn) are not known to the *Mósiro*, as far as I have been able to discover.

I have said elsewhere that the bulk of the Kenya Dorobo would seem (according to the statements made by the Dorobo from whom the present information has been derived) to be *Aramanik* and *Balaŋga*. This was with reference to the Dorobo living among the Kenya Masai and was not intended to include such Dorobo as there may be among the Nandi to-day.

On one occasion I was lured to walk over twenty miles by the promise of being shown some "rock-paintings" alleged to have been made by the *Mósiro* or other Dorobo and to be extremely ancient. My informant assured me that no man could remember the time when they had been done and that the cave in which they were was regarded with great reverence throughout the countryside. I went, only to discover that the place was a disused *Ol-pul* and that the paintings (most of them were of Masai shields, but some were of a character bordering on the lascivious) had obviously been made by Dorobo or Masai Muran within the last five years or so.[2] Some were even fresher. Charcoal, red ochre, lime and wood-ash were the mediums used.

To the casual observer (particularly one new to Africa) the Dorobo, Masai, Kwavi, Gogo and even the Arusha warrior when in panoply might all seem to belong to the same tribe. To the habituated eye there would be many differences readily

[1] *Kipokandet* (Nandi); *Hoombi* (*Mósiro*).

[2] When the Masai Muran go into *Ol-pul*, they are often accompanied by one or more Dorobo, generally *Mósiro*. The duties of the latter are to plait the Masai warriors' hair, cook and make themselves generally useful. Their reward is as much meat as they can consume.

3:Huntingford E-5 (1921-1928)1929 FL6 Dorobo FL6

together. The rim is made of a single stick bent in an oval and the ends bound together; across it are fastened pieces of tree-rope.[1] Grindstones (*littio*, N.) have already been mentioned.

The Dorôbo have no knowledge of metallurgy, and they have no musical instruments, pottery, or, apparently, objects of ivory. Metal-work and pottery they buy from the Nandi.[2]

Trade and Commerce.

Trade is by barter. The Dorôbo give the Nandi baskets, dressed skins, and bows in exchange for ironwork, tobacco, pottery, beads, and other necessaries which they cannot produce themselves. There are no special market-places, but goods are taken to any place where there are Nandi, and there exchanged.

Land.

(i) *Tenure.*—The forest is divided by the elders into sections, and each family has its own section of forest. The boundaries between family holdings may be paths or rivers.

(ii) *Geographical Divisions.*—The Dorôbo divide their country into divisions called *koret*, pl. *korosuek* (N.). The chief divisions appear to be called Kipkorom, Sirua, Kimurienge, Sosoiyo (bamboo, N. *tekat*), and Mokopich. The majority of the present place-names are Nandi.

The points of the compass are called as follows:—North and South: Murot (N.). East: Ye-torur (N. *ulin-durur* = up). West: Ye-'rek-to (= where(-the-sun)-descends-thither).

III.—Government.

The Kâmelilo-Kâpchepkendi Dorôbo have now no chief. The last to hold office was Parîgetuny[3] arap Ñgamûgam, who was chief at the time of the Nandi Punitive Expedition, 1905. He is still alive, though he no longer holds office. The chief was elected, and the office was not hereditary. The chief (*kiruogindet* (N.)=councillor) was chosen for "îgelyepta kitio" ("tongue only" = sense, ability and position). The only form of Government that exists now is a council of elders (*kiruoget ap poiisiek*, N.), who meet and decide on matters which are brought to them. They seem to have little power of enforcing obedience to their decisions, though they claim

[1] This is described and illustrated, although it is a Nandi use, since H.N. does not mention it.

[2] On the use of horns, *see* V, "Miscellaneous." These can hardly be considered as instruments of music.

[3] N. = lion-killer.

father (if he lives nearby), to his brothers, and lastly, if there is any over, to his clansmen in the settlement; so that a man who gets a pound or so of Nandi tobacco does not keep much of it for himself.

Drink, mainly in the form of honey-wine, is prepared not so much for private consumption as for social gatherings. It is used in various magico-religious performances, and as part of the bride-payment. When a man is visited by a friend or two, he gives them honey-wine; when there is a clan council, honey-wine is drunk; and when men and women meet for a wedding or a naming they drink honey-wine. It is thus an indispensable part of Dorobo social life. When a man wants to relax, he lies down and goes to sleep; but his amusement is composed of social gatherings. Visiting, ceremonials, and clan councils in fact provide him with his entertainment, and conversation and gossip seem to take the place of games and dances. I saw no sign whatever of the game called *kecuiek* by the Nandi, which is played with seeds or pebbles in holes in the ground or in a board, and never heard it mentioned. I neither saw nor heard of a dance, and I never once heard a Dorobo of either sex singing.

The principal standard of wealth is really a man's skill as trapper, hunter, and bee-keeper. But the products of this skill are perishable, and formerly the only way in which tangible wealth could be accumulated was in the *form of weapons, honey-barrels, and dogs*. Now that the old hunting conditions have gone, it is becoming possible for a man to accumulate wealth to a very limited extent in cattle or goats, which he can get by purchase, gift-exchange, or through bride-payment. The use of money has just become familiar, and a certain number of Dorobo earn wages; but except for one or two who have joined the Police, wages are not high, and the average in 1939 was 7 to 10 shillings a month. So far the Dorobo have had little inducement to work for wages, except that by signing on as squatters for a small wage they can acquire a temporary right to live on what was their own land. Beyond the fact that money enables them to buy a little extra food, our idea of wealth means little or nothing to them, and they have not yet advanced far enough into the transitional stage for it to be anything more than a small supplement to their traditional way of living. It is all that they can do to maintain themselves, let alone accumulate reserves or surplus wealth.

The transitional stage which the Dorobo had reached by 1939 is that from hunting to agriculture, with at the same time a strong desire to acquire cattle. It is sometimes suggested that hunting peoples like the Dorobo are really agriculturalists or pastoralists who have had to give up their agricultural or pastoral way of life and take to hunting. This may be true of some, such as the 'false Dorobo' in parts of Kenya who are merely outlaws and fugitives from various tribes. But it is quite clearly not true of the real Dorobo[7], like those who form the subject of this paper, who are unmistakably non-pastoral and non-agricultural. Their basic hunting tendency is shown by their character and behaviour, by their hunting techniques and skill, by

[7] Cf. my remarks in JRAI 59. 1929. p. 378.

/235 cont./

411 322 [283] [237] with fat several times, it is bent over the fire. The string is plaited together, turning and braidlike, out of short animal tendons and is extended by further interweaving up to the required length. The projecting starting-ends of the individual pieces of tendon are neatly cut off, whereupon one then rubs the now finished bowstring with some fat.

The arrow shaft (Fig. 84) is carved out of a dry wooden stick, first rounded, then smoothed by scraping. The upper end is wound [237] [824] [412] with tendons that have been coated with the varnishlike juice of a not yet described species of gladiolus known as diriss, whereupon, on top, one drills in the one- /236/ /Figs. 83 and 84 appear here/ 411 centimeter-long hole for the tang of the arrow by a twirling motion [237] with a thin wooden chisel. At the lower end the three-part feather- [136] [283] ing -- out of the feathers of the carrion vulture (Neophron percnopterus) -- is first fastened on by being wrapped with a very fine [824] bast thread and then glued fast with the gladiolus juice just mentioned. Another wrapping of animal tendons is found between the feathering and the rear notch for the bowstring, in order to prevent a splitting of the shaft.

[325] [322] [171] [439] The people buy the iron points; only if a point breaks off /237/ do they as a rule forge a new one for themselves. Clubs are carved from a piece of wood, as among the Masai. They buy the spears, of which there are one or more in almost every camp, from the blacksmiths of the Masai. The spears serve as weapons only in the camp, where shooting with arrows is not permitted, on account of the danger connected with that, since they are always poisoned.

415 [439] [285] The Asá for the most part buy wooden bowls and gourd bottles from sedentary tribes. On the other hand, in some places they plait shallow baskets, which they use for storing food.

524 829 171 The fact that the Wandorobo do not play the board game so popular among the Masai was explained to me by them with the words: "During the game we would forget to hunt and then, with our families, would have to starve."

512 517 With the coming of darkness complete stillness as a rule comes over the camps, quiet even during the day; the day's work is done and everyone goes to his hut. Only on moonlit evenings do the old [273] people often still sit in the open for a few hours, talking, with a [535] gourd bottle of honey beer, while the young men and girls dance [533] and let their falsetto song ring out through the still night, from

512 which now and then, as though as an answer, the cry of a predatory
[273] animal resounds over to them. The dance differs from that of the
[535] Masai through the fact that the men do not lift their feet, but only
[538] raise their heels. The narrow, twisted plaza of the camp permits
535 only dancing on the spot. Just as there, here too it is accompanied
121 each time by song.
[321]
533 In a falsetto (1)

[126] 1. Recorded by Herr Stabsarzt /staff physician/ Dr. Skrodzki.

the tone, just barely reachable, roughly the A above middle C (sometimes stricken), is strongly accented and shrilly sung out. In an extremely irregular beat the succession of tones now descends in the six-four / $\frac{6}{4}$ / chord of A. At the A below middle C the chest tone sets in, but relatively softer then the falsetto, until, descending in the same degrees of the scale, the second A below middle C is reached. The final tones are more certain, because they lie better for the singer; the falsetto usually hovers around the tone sought, in part uncertainly, in part playfully.

Appoggiaturas, triplets are repeated all the more frequently the more certain the artist gradually feels in adhering to the melody -- sit venia verbi /so to speak/. No other figures are observed. Finally the voice once more glides within the seventh chord up and down the last octave; or the fundamental tone is phrased in contrapuntal fashion at the end. The entire song is an irregular variation of a six-four / $\frac{6}{4}$ / chord. It is limited almost entirely to two octaves. Through the greater probability of being hit properly the fundamental tones of the chord form the natural rest points for the voice and may sometimes be interpreted as strong parts of the measure. In marching they coincide with the putting down of one foot. Nevertheless there is not any sort of time that can be observed. The delivery is often parlando, and the tempo also corresponds to this style. The fact that the /238/ text is arranged ad libitum /at will/ for each use heightens the interest, if not the musical enjoyment, of the listeners.

Some *Mósiro* Folk-Tales, Folk-Lore and Superstitions

"*Epilte dimda hitiò*" [1]

Thus answered a *Mósiroi* Dorobo whom I rallied on his silence and attitude of strained attention during a halt by the wayside when on safari in the remoter areas of the Tanganyika Masai Reserve.

The bush and what can be wrested from it—wood for his bow and arrows, honey for his wife and children and for barter, the bark of the *Ol-mukutan* [2] tree, fibre for plaiting into his hair, and last (but most important of all) the skins and the meat of game animals—these things bound the horizon of the Dorobo. It is therefore not to be wondered at that such folk-lore tales as exist among the Dorobo at the present time are chiefly concerned with animals and animal life. Similarly, the paramount interest in life of the Masai is apparent from a study of the extant folk-tales of that tribe, which deal, to a great extent, with cattle and other domestic stock. The tales one hears told to-day are, in all probability, but a few of the more easily-remembered of a host of stories now forgotten for all time.

The following examples have been selected from a large number of stories told by the *Mósiro* themselves and admitted by the Masai to be Dorobo in origin.

The Dikdik and the Elephant.—The dikdik, when out walking in the bush one day, chanced to fall over a piece of elephant-dung in his path. This made him very angry and he said: "Thus am I incommoded by the dung of the elephant! I am so small that I cannot hope to inconvenience him in like manner, but I will arrange for all the members of my tribe to come and make use of one place, and thus in time the heap may grow big enough to trip a passing elephant." This is the reason why piles of dikdik-dung, showing that many of these animals have used the same place, are often seen in the middle of a bush path. (A story very like this is told by certain Coastal tribes.)

The Tortoise, the Hare and the Hyæna.—These three made an agreement to rob a rich snake. The latter had cattle and

[1] "I am listening to something in the bush." Cf. the Masai *En-dim*, bush.

[2] *Albizzia anthelmintica*, according to the authority quoted in Hollis. It is used as a remedy for worms and to produce a large appetite. It is highly prized by the Masai and is scarce in the Kittito localities.

supported the roof with his fore-paws, for he had no tusks. Whereupon the wart-hog said: 'You are stronger than me. Hold up the roof with all your might while I run out for some timber to prop it up.' The lion, flattered, agreed, and the wart-hog ran out and quickly made his escape."

(History does not relate how long the lion remained holding up the roof before he realised that he had been duped by the cunning wart-hog. This story is very popular and is always received with roars of laughter.)[1]

D [539]

The Dorobo plays the part of buffoon or low comedian in many Masai folk-tales.[2] The Dorobo themselves are well aware of this and regard it as a huge joke. A tale told by a Masai in which a Dorobo figures in an absurd light generally elicits hearty applause from the Dorobo present. I select the following example.

M 539 829

The Dorobo and the Cow.—The Dorobo is an impatient man. Once he was given a cow, and some days afterwards this cow was crossed by a bull. The Dorobo waited a month. Then he waited another month. He tried to milk the cow, but no milk would come. He thereupon said: "What sort of a cow is this? It will not give birth; it has no milk; it is altogether unsatisfactory." He then went away to sleep, saying: "Perhaps it will have given birth by the time it is morning." In the morning, all was as it had been before and the efforts of the Dorobo to milk the cow met with no more success. The Dorobo, who was determined at least to obtain milk, thereupon seized his knife and split up the cow's udder (for all Dorobo are impatient men), but no milk came, and his knife penetrating too deeply, the intestines of the cow fell out and it died. The Dorobo was very surprised and said: "This is a bad kind of cow and I do not understand it." He then proceeded to eat the meat until it was all finished.

M 539

R 171 538

I was surprised to discover so little resemblance between *Mósiro* folk-lore and folk-tales and those of the Nandi as given in Sir Claud Hollis's book. There is more affinity between the *Mósiro* and the Masai in this respect. This may perhaps be explained by the comparatively long period the *Mósiro* must

[1] [Some Bantu tribes tell it of the Hare.—A. W.]
[2] For further examples of this see Hollis.

2;Maguire G-5 (ca. 1926) 1927-28
FL6 Dorobo FL6

have lived in the country of the Kitêto Masai, since they are stated to have been the precursors of the Masai in this part of the world.

I was unable to elicit any folk-tales from the *Aramanik*, who say that they know no stories or legends except those they have learned from the Masai. It is possible that further efforts in this direction might meet with better success. The *Aramanik* are not as friendly or as ready to discuss their own affairs as are the cheerful, happy-go-lucky *Mósiro*.

Many Masai superstitions and superstitious practices are to be found among the Dorobo. There are, however, certain customs and observances of a superstitious nature practised only by the Dorobo. Of the following three examples, the last two given are in this category.

The *Mósiro* will not kill a python. They say it is a hunter of meat, as are they themselves. Furthermore, if it be killed, the ground where it dies and where its blood is split is ever afterwards fatal to cattle grazing there.[1] No explanation is given of this, and it would seem worthy of note that the Dorobo are exceptionally quick and skilful killers of all other snakes.

When following a native path or a road, if a Dorobo comes to the place where the track of a snake crosses the path, he will never step over it without first kicking up the sand or earth in order to break the continuity of the snake's track. This is done in order to avert evil, and is stated to be the only efficacious way of ensuring that the snake in question will not eventually kill the man who has crossed its path.[2]

If a Dorobo has been robbed and if the thief cannot be found, the following procedure is sometimes resorted to. The man who has suffered the loss heats his sword in the fire until it is red and then, plunging it into the earth, he says: "The thief shall die to-morrow." This is regarded as a very bad practice and is seldom indulged in, as the injured party, no matter how much he may have lost, knows that he will become extremely unpopular as a result of his action.

It seems likely that in a few years' time there will be no *Balaâga* and no *Kisyalaâgai* Dorobo. As I have said elsewhere, it is now almost impossible to find *Balaâga* or *Kisya-*

[1] See Hollis: *The Masai*, p. 80. [2] *Ibid.*, p. 79.

/263 cont./

695 besides the ordeals, the bier test also prevails as a means of convicting the one accused. In contrast to the Masai, here the innocent one accused receives no compensation.

562 694 695 Women may appear as witnesses before the court, but they are not entitled to make a complaint; rather, their husbands make the complaint for them.

672 934 Here, too, the mentally ill occupy an exceptional position in legal matters, /264/ in that they remain unpunished for offenses that are atoned for by fines. They are not chained, but are allowed to go about freely, and, as long as they are harmless, they are given shelter and food. This is denied to the mentally ill who are dangerous, because of which they quickly perish.

XVI.

000 The story of the discovery of arrow poison. -- Other stories and fables.

• 538 The stories of the Wandorobo describe for the most part their own hunting experiences, especially, of course, those of a peculiar nature and with large, dangerous game. It is probably to be taken for granted that in this "hunter's yarns" also run through them.

The Discovery of Arrow Poison

539 224 298 411 A poor widow, whom no one wanted to take in and feed, roamed steppe and bush daily, in order to appease her hunger miserably with roots, berries, and tree bark. One day she chewed on a small piece of bark that was distinguished by a very bad taste. Soon afterwards vomiting set in so violently that she was sick for a few days. She thought: "I should probably have died if I had eaten any more of it; since I can not hunt game, perhaps I can kill it with this." When she was well again, she went with her pot to the place in the steppe where in a rocky basin there was water to which the wild animals came to drink. Here, for several days in succession, she boiled the wood of the poison bush and kept pouring the liquid into the little pool. Finally one morning she found ten dead buffalo lying in its

FLA Durabo FLA

• 539 donkeys. The tortoise was selected, after much discussion, as the one to kill the snake, because the snake did not fear him (for his homes were outside his body) and would be likely to be off his guard in consequence. Neither did the tortoise (whose homes were outside his body) fear the snake. While the tortoise and the snake were fighting, the hyæna made off with the cattle and the hare took the donkeys. The hyæna, being greedy, ate all the cattle and then stuck their tails upright in a muddy place. He then ran to the hare, crying: "See! all my cattle have fallen into this swamp and only their tails can now be seen! Woe is me!" The hare, however, refused to allow himself to be deceived by the hyæna or to part with any of his donkeys, and went off to live with them. [illegible] them, and they have become the striped donkeys[1] one sees on the plains. The tortoise at length succeeded in killing the snake after a long battle, and looked round only to discover that he had been cheated and deserted by his companions. To this day he has been unable to catch them, as he is such a slow walker, but he has not given up the pursuit and still goes through the bush, calling to them always: "Kwe! Kwe!" (the distinctive and bell-like note of the tortoise that natives say is so often heard).

The Sun and the Moon.[2]—The sun and the moon quarrelled. The reason for this was because the moon wanted to appear in the daytime. The sun refused to agree, and they fought. The moon was wounded and was also badly wounded, a big piece being knocked out of it. This is why it is not round like the sun and why it goes low down in the sky nearly always and is only seen at night. It wishes to avoid the sun, of which it is afraid. When the sun disappears from view at night, it awaits a favourable opportunity and then, when it is cloudy, rushes across the sky to the east again (so fast that no man can see it). It then rests until it is time to begin work on the following morning.

The Dikdik and the Eland.—Of those whose meat is tender, the eland is the largest animal and the dikdik is the smallest.

[1] Zebra.

[2] No use for the moon is here given. See Hollis: *Nandi Language and Folklore*, pp. 113, 114. Orde-Browne: *Vanishing Tribes of Kenya*, pp. 111, 112.

Maguire G-5 (ca. 1926) 1927-28
FLA Dorobo FLA

This makes the latter feel jealous. He hates the eland on account of his superiority in size and strength, and to show that he is every bit as good as the eland, he has grown a long tuft of hair on his forehead, just the same as an eland bull. The eland has a habit of rubbing his forehead in his urine.[1] This causes the tuft on his forehead to grow strong and thick. The dik-dik follows this custom also, partly to increase the growth of his frontal tuft and partly in order to prove that anything an eland can do, he can do as well.

The Wart-hog and the Lion.[2]—(About four miles south-east of Kibaya there is a curious cave in a bank beside the river bed. The floods of years have washed away the earth from beneath a flat, granite-like rock outcrop which forms the bank in one place, and the cavity thus made (4 yrs. to point, 4 yrs. 3 ins., or three-and-a-half feet from floor to ceiling) has often been used in the past as an *Ol-pul*[3] by the Masai. While taking shelter in this cave one day during a downpour of rain, a Dorobo told me the following tale.)

"A wart-hog once came here to eat. Finding the place warm and comfortable, he lay down and was speedily fast asleep. He awoke to find that a lion had entered the cave and was advancing on him with the intent to kill him, for wart-hogs and lions are deadly enemies. The wart-hog brought all his wits to bear on the matter of making his escape, for he greatly feared the lion, who was very big and strong. Suddenly an idea came to his mind, and standing on his hind-legs, he pretended to support the roof of the cave with his tusks, calling out sometimes in a frightened voice: 'Lion, lion, come and help me to hold up the roof, as it is falling and we shall both be killed!' The lion, deceived, hastened to the spot and

[1] This fact has, I understand, been authenticated. I have never seen eland performing the act, but on examination of the frontal tuft of a mature bull eland will lend one to believe in the assertion. Cf. *The Journal of a Disappointed Man* (W. H. P. Dutton&Co.), p. 191: "*The common Eland is known to accelerate on the left of him on the crown of the head, and it does this habitually, when lying down, by bending its head around and down—apparently because of the aerials, perhaps of sexual importance during mating time, as it is a habit of the male alone.*"

(History does not relate how long the lion remained holding up the roof before he realised that he had been duped by the cunning wart-hog. This story is very popular and is always received with roars of laughter.)[1]

D [539] M 239 859

The Dorobo plays the part of buffoon or low comedian in many Masai folk-tales.[2] The Dorobo themselves are well aware of this and regard it as a huge joke. A tale told by a Masai in which a Dorobo figures is an absurd light generally elicits hearty applause from the Dorobo present. I select the following example.

M 539

The Dorobo and the Cow.—The Dorobo is an impatient man. Once he was given a cow, and some days afterwards this cow was crossed by a bull. The Dorobo waited a month. Then he waited another month. He tried to milk the cow, but no milk would come. He thereupon said: "What sort of a cow is this? It will not give birth; it has no milk; it is altogether unsatisfactory." He then went away to sleep, saying: "Perhaps it will have given birth by the time it is morning." In the morning, all was as it had been before and the efforts of the Dorobo to milk the cow met with no more success. The Dorobo, who was determined at least to obtain milk, thereupon seized his knife and split up the cow's udder (for all Dorobo are impatient men), but no milk came, and his knife penetrating too deeply, the intestines of the cow fell out and it died. The Dorobo was very surprised and said: "This is a bad kind of cow and I do not understand it." He then proceeded to eat the meat until it was all finished.

R 151 538

I was surprised to discover so little resemblance between *Mósiro* folk-lore and folk-tales and those of the Nandi as given in Sir Claud Hollis's book. There is more affinity between the *Mósiro* and the Masai in this respect. This may perhaps be explained by the comparatively long period the *Mósiro* must

[1] [Some Bantu tribes tell it of the Hare.—A. W.]
[2] For further examples of this see Hollis.

The Sanye and Aringalo have been in subjection to the Gale, and speak dialects (370)
of Gale; the Bori hunt for the Sanuk. They call themselves Watta or Waiwa
(the Gale call the Sanye, Wanye, pl. Waiwa), which is also the name of a hunting
people in Abyssinia who speak Gale but have also a language of their own.[1] They
must themselves be the original inhabitants of Abyssinia. The Abyssinian Watta,
the Sanye, Bori, Aringalo, Midgan of Somali, together with the Dorze S.W. of
Lake Stephanie, and the Wagaro of Kilimanjaro, are claimed by R. Shantil[2] to
be connected with the Dwellers. And it is not impossible to identify the people
called Gaiwi in the "Inscription of Una" (VIth dynasty, King Pepi I) with
these modern Watta, of which the stem is possibly wa-, and the g a plural suffix.
If we may accept this identification, the traditional antiquity of the hunting tribes
is confirmed.

The old men give the following account of their past history :— 193

Ka-ki-manye ali-tuk kwanne-sha shikinye-tukul, kiwi
We-dwell here mountain-there at-the-stream, there-from

Shuli kwanne-i kwanne-i ah kyikwayuk kwanne-ta [194]
the-Sanuk side-the open-country-the and the-Gale-Galla-Masai side-the-from

shpiwi. Shikinye kiwi Khyakyaqwane shinye kwanne-sha tukul
he-plain. Gale-the there-from the-Galla-s there-of (or) mountain-there at

sha kwal ga Sukuf kwayuk-ga kwayu. Sha-ki-wane kiki'-sha.
there-from of Galla they-are-not language. Not-we-know thing-that.

("We have always lived in this country; the Shuli were on one side, in the
open country, the Gale-Galla Masai on the other side in the plain. Of old, the
"Sukuf" lived in the plain of Galla below. We do not know anything else.")

At the present day the Khwalla-Khyakyakwah Dwellers do not seem to be very 101
numerous or very flourishing. A number have left the depths of the forest and
live on the edge (accepted up around). They assign as their reason for leaving the [4.]
forest, the hardships consequent upon an epidemic of disease (variola, ?), which must [4.4]
probably recall pox; the oldest of the Khyakyak age say this happened when they
were children, i.e. somewhere about 1880, when the Masai suffered heavily from
this disease. When we visited Dwellers here in the forest, we were told that there
were very few here in that part of the forest. I suspect the Dwellers like to make
it seem that few live in the forest.

[1] R. Cavalli, "The Folk-literature of the Gala of Southern Abyssinia" (Harvard African
Studies, III) p. 300; Shantip, "I and twenty stages west of mountain call also Shuqin."

[2] Bull. Soc. Geogr. Ital., Roma, s. 3, vol. 11, p. 170.

[3] Gale was one of the Shuli subdivisions, or "countries" which was not all also the Shuli
Province Expedition of 1900. It included the Dwellers country, and also the plain on the East
of the Shuli mountains from Mukenzi to Kibre, whose people were the Shuli with whom he
fight.

[123] [124] that continual disobedience is punished by expulsion from the tribe. They described their ethics in the following terms :—

Ko'nech kpâkh ol kwâch ake ngwach ak ake
We-take-counsel the-matters that we-may-go children good and children

[125] nech, ol kwâne pâk tukul, kpanâk ekâk'
bad this they-may-understand (-they) the-people ak. Ki'ne-ndiene the-men

ake tukul, kwâne, ol kwe enet ake,
other way, we-expel (-him) that he-may-go the-country other.

["We take counsel that we may find what is good, and know what is bad, that all men may obey. If any refuse, he is driven out of our country."]

IV.—Religious Beliefs, Magic, and Medicine.

Religion.

[111] The religious beliefs of the Dorobo are even vaguer than those of the Kwafi.
[116] They believe in a god Asista (K.), who is the sun and moonshine, and who has a
[113] sister Aruwa* (K.), the moon.† No offerings are made to either, but the men pray
[114] to both before going on a hunt. The prayers seem to have one form :—

Asista* kpâp'-ech emâk,
God, Ill-he-will the-food,

[115] or,

Aruwa,* kpâp'-ech emâk,
Moon, Ill-he-will the-food,

[116] They believe also in ghosts and spirits (mindet, pl. mik, K.) which are good and
[117] bad. Prayers are addressed to the good ones (with the subjunct) to obtain food and
[118] health, e.g. :—

Ole, kpâp'-ech emâk,
Thou-spirit, Ill-he-will the-food,

[119] Ole, kpâp'-ech ngwet,
Thou-spirit, Ill-he-will the-health,

[120] Libations of honey and water (ngwenâk)‡ and of honey-wine (kipkelach, K.) are
offered to the good ones, in order to obtain food and health. These libations are
made from gourds (kwesta), and while they are poured out, the formula,

[121] kpâp'-ech emâk ol kilpâpo ngwet,
Ill-he-will the-food that we-be-filled-with health,

is pronounced.

[111] * I have not come across this particular relationship before in the Nile-Hamite group; though other tribes of this group hold that the sun and moon are related, or are husband and wife (the latter Masai and Nandi). (See Nandi, The Sun, for the views of the Suk, Kipsigis, Turkana, etc.)

† The Nandi also ask.

Note.—In the foregoing vocabulary the letter (K.) does not necessarily mean that the equivalent Kenili word has exactly the same meaning or the same form as the Dorobo word. In several cases the Kenili words have quite different meanings, though referring to the same sort of thing as the Dorobo word, e.g. "moonshine," the Dorobo for "night," means in Kenili, "darkness when there is no moon." And where, e.g., "goat" is marked (K.) it does not necessarily follow that the Kenili is "goat" (in this case the Kenili is "gat"). The object of the indication is to show what words are to be considered Kenili, what words are to be considered dialect, and what words Masai.

Examples of Dorobo. (Free Dorobo in Italics.)

normally go elsewhere for the night, leaving the hut to the men. In the matter of hospitality, relationship by blood, marriage, or clan is a deciding factor in the length of time for which a man may expect to be put up by his host. Thus, no matter what the age-set situation may be, a man who is neither a relative nor a clansman cannot claim more than two nights' hospitality on account of necessity, and will not be given honey-wine; while a relative or clansman may be fed for a week or even longer, and the host will give him honey-wine if he has any.

3. Behaviour

A brief summary of the modes of behaviour towards important relatives was given by a Dorobo in the following words: *Makiewpe papa ne kwoiyo a kupiro lakwat; makiewpe kokwey papa; makimwoci korkut ak siyo nolok ee ormis, anwa ya, agwi nolok ap kwonisiat; kiorwenichiki tukul.* ("A man does not use bad language to his father, though his father may beat him as a child, nor does he use bad language to his father's brother; he does not speak of dirty things, nor of sexual matters, to his mother and his mother's sister, for it is bad to do so; but we all play together, i. e. we are on terms of friendliness and 'clean fun'.") Generally speaking, seniority is a matter of age, except with respect to the father's brother and men of senior age-sets.

It is unlikely that any Dorobo ever sees his father's father's father, and the father's father is seen only by small children. The father's father is regarded much as one's own father. But the father's mother helps in the care of the children, and so becomes an object not only of familiarity but of affection as well to the children. To all of the father's generation a man should show respect and obedience. He must not insult them, nor use unsuitable language in their presence. Corporal punishment may be inflicted on a rude or disobedient child with the hand or with a stick, by father, mother, and father's brother. Verbal correction is also a common method of dealing with naughty children, and though a man would not as a rule say to a naughty child who had made him angry anything so drastic as *Amin ololai* (may you die of dysentery), in case the spirit-world took him at his word, he might go so far as *Iaw piat* (eat dirt), an expression which if used by a child to a senior would certainly earn a beating.

Most Dorobo are fond of their parents, and treat them in old age with much kindness and consideration. Wherever I found aged parents living with their sons it was the same; and the more helpless the parent, the greater the trouble taken to make them comfortable. The old father of Pilo, to whom I have already referred, was such a one. Most double, hardly able to move without help, he spent his time lying outside in the sun when it was warm, and indoors beside the fire when it was cold. He had to be helped in and out, and fed and looked after like a child; but it was all done cheerfully by Coimion and his wife, in whose hut the old man lived, and if they could not attend to him, Pilo and his wife did.

/238 cont./

539 533 An overheard text is: "If I were a bird that is sitting beside the river and a zebra came to drink, I would, in the little bird's place, kiss (or bite) it, because I love it very much. But I am big and therefore can not."

512 Around ten o'clock at the latest the merriment reaches its end, and the camp is finally wrapped in silence.

525 The statement of the Wandorobo, according to which it is still supposed to have never happened that human beings have been killed by predatory animals within the camp seems remarkable. They [189] therefore do not fear them at all and believe themselves safe from them because of their magic medicines, some of which, according to popular belief, keep the wild animals far away, while others have the effect of the cap of invisibility.

III.

601 Kinship designations and terms of address.

The kinship designations are the following:
Father: aba or baba.
Mother: ñjo or ea.
My wife: mai totuan.
My brother: bidjog uan.
My sister: bidjot uan.
Half brother: weku baba.
Half sister: wetu baba.
Brother of the father: bidjog e baba.
Sister of the father: bidjot baba.
Brother of the mother: bidjog ea.
Sister of the mother: bidjot ea.
Son of the father's brother: weku bidjog baba.
Son of the father's sister: weku bidjot baba.
Daughter of the father's brother: wetu bidjog baba.
Daughter of the father's sister: wetu bidjot baba.
Son of the mother's brother: weku apoggech.
Son of the mother's sister: weku bidjot ea.

/263 cont./

695 besides the ordeals, the bier test also prevails as a means of convicting the one accused. In contrast to the Masai, here the innocent one accused receives no compensation.

562 694 695 Women may appear as witnesses before the court, but they are not entitled to make a complaint; rather, their husbands make the complaint for them.

672 934 Here, too, the mentally ill occupy an exceptional position in legal matters, /264/ in that they remain unpunished for offenses that are atoned for by fines. They are not chained, but are allowed to go about freely, and, as long as they are harmless, they are given shelter and food. This is denied to the mentally ill who are dangerous, because of which they quickly perish.

XVI.

000 The story of the discovery of arrow poison. -- Other stories and fables.

538 The stories of the Wandorobo describe for the most part their own hunting experiences, especially, of course, those of a peculiar nature and with large, dangerous game. It is probably to be taken for granted that in this "hunter's yarns" also run through them.

The Discovery of Arrow Poison

539 224 278 411 A poor widow, whom no one wanted to take in and feed, roamed steppe and bush daily, in order to appease her hunger miserably with roots, berries, and tree bark. One day she chewed on a small piece of bark that was distinguished by a very bad taste. Soon afterwards vomiting set in so violently that she was sick for a few days. She thought: "I should probably have died if I had eaten any more of it; since I can not hunt game, perhaps I can kill it with this." When she was well again, she went with her pot to the place in the steppe where in a rocky basin there was water to which the wild animals came to drink. Here, for several days in succession, she boiled the wood of the poison bush and kept pouring the liquid into the little pool. Finally one morning she found ten dead buffalo lying in its

/264 cont./

539 224 278 411 vicinity. She ran to the camp in order to fetch men so that they would carry the meat home. When they saw the dead buffalo, they could not understand how it had been possible to kill so many at once. Then the woman told them how she had done it, and now they praised her as the best and cleverest of women and everyone wanted to marry her. After the woman had showed them how to prepare the poison, they made it themselves and smeared their hunting arrows with it.

Some Stories and Fables

539 An ol doroboni shot a giraffe, and since it was evening and he was far from camp, he stayed with the animal during the night. He wanted to stay awake because of the predatory animals that were to be expected, but weariness overcame him. In his dream he saw a lion creeping up. He woke up with a cry of fear. Still half asleep, he took his own leg for the lion and hit it with his knife with all his strength. His campmates, who had set out to look for him, found him with a large wound the next day in the steppe and carried him home.

/265/ An ol doroboni found in the steppe an antelope that he took to be dead. He laid bow and quiver beside the animal and started to skin it. After he had already made two cuts on the belly side, the animal leaped up and ran away with the knife in its body.

A father went hunting every day with his boy. For a long time they were lucky and brought booty home every day. But then there came a time when they did not succeed in killing even a single animal. One day, when they had again stalked in vain, they camped far from their hut in the open steppe. In order to warm themselves, they made a fire. Hunger tormented both of them terribly. Then there came to the old man the idea of killing his son and appeasing his hunger with the corpse. He said to the boy: "Go and fetch fire-wood so that the fire will be bigger." The boy did as he was told.

/265 cont./

• 539 When he returned with a load of wood, he called out: "Father, come quickly, some game animals have appeared." The old man came running, saw two large antelopes, and killed them. Then he started to cry and said: "My dear child, sit down and eat." He himself, however, ate nothing. When the boy had eaten his fill, dawn had come, and the father sent him to the camp to call the people and they, too, would come to eat. When they came, the old man asked: "Is this one here, is that one here?" and so on until he had mentioned the names of all his campmates. When he was convinced that all were present and were eating, he said: "Hear me, I am evil, I am not a human being, but a monster. Before I shot these antelopes, I intended to kill and eat my son. I am too evil to live with you any longer and deserve death." With these words he slit open his belly, tore out his intestines, and cut them up.

A man had killed an antelope; another man stole the game from him. The injured one now plotted revenge. One day he took a child of the thief with him into the steppe and told it that it was to creep into the earth hole of a wild pig. After it had done this, he called its father and said to him: "There in those holes is a wild pig, it will come out soon, shoot it." Then he knocked on the ground as a signal that the child was to come out of the hole. When it dashed out, its own father, who took it for a wild pig, shot it with his poisoned arrow.

An ol doroboni shot a buffalo and sold a piece of its skin to a Masai warrior, who wanted to make a shield out of it and remained in debt for the payment. One day the two met in the bush. The warrior had just come from plundering livestock and was leading a large head of cattle. He requested the ol doroboni to watch it a moment while he wanted to go to a nearby brook in order /266/ to drink water. When the warrior had gone off, the ol doroboni struck dry wood together and shouted as though he were being threatened. The ol murani thought that the owner of the head of cattle had come with his friends in order to take it back again and therefore stayed

/266 cont./

• 539 away. The ol doroboni intended this to happen. He then killed the animal at once, caught its blood in a leather bag, and carried the meat home. The next day the ol morani though that the ol doroboni had deceived him and went to his camp. He asked the wife: "When did your husband last bring meat home?" She replied: "Last month." To his further question, "Where is your husband?" she said: "He is lying in the hut and is very sick." The warrior did not believe this and wanted to see the man himself. The old ol doroboni quickly put some cattle blood in his mouth and then came creeping out slowly and groaning. Then he started to cough and spat out the blood. The warrior thought that the sick man was about to die and quickly ran away. That is how the ol doroboni managed to have himself repaid generously for his piece of buffalo skin.

Two Wandorobo, an industrious one and a lazy one, went hunting. The former killed an antelope, some of which the two ate immediately. Then the industrious one grew thirsty and told the other one to fetch water. But he refused and said that he would watch over the meat while the other one went to drink. After he had gone, the lazy one set to work to tie up the meat and carried it off. On the way he met the other one. The latter said: "Why did you take my meat away?" The former replied: "This is my meat, yours is still lying at the spot where you left it." Then the industrious one set out in the direction of the spot, but turned around after a few steps and, making a detour, ran quickly to the camp. There he said to the wife of the lazy one: "Go to the hut of my wife, I am expecting your husband in your hut, we have something to talk over." The wife went, and the industrious one waited for the lazy one in the latter's hut. When he arrived, he called out: "Wife, here is meat, take it." The industrious one said: "Hm!" and took the meat. "I'm going now," said the lazy one, "and fetch the skin of the game." With that he departed, and then the other one at once carried the meat to his hut, where it was immediately roasted and already eaten when the other one returned. He had no longer found the skin: a hyena had dragged it off or devoured it.

/266 cont./

• 539 Two Wandorobo killed a buffalo and decided to eat it all immediately, in order not to have to give any of it to an old man following them. They ate such quantities that even their ears became quite fat and the ear lobes so swollen that they burst the ol gissoi ornaments. Then they saw /267/ the old man coming from afar and wanted to consume the rest of the meat quickly. But then both of their stomachs burst, and, when the old man appeared, he found them already dead.

An ol doroboni set out to hunt and shot a large antelope. Immediately thereafter he noticed how, high above him, vultures were circling around the slain animal. He was afraid that other Wandorobo, alerted by the birds, would come hurrying up to eat with him. So he shot at the birds and, since they were soaring high above, stretched his bow with all his might. The arrow flew so high that he lost sight of it. Then he bent down to drink the fresh blood of the antelope. The next moment the arrow came back and struck him in the neck so that he died. The men approaching found animal and hunter lying dead side by side; they dragged the latter to one side and consumed the game.

An ol dorobooni shot an antelope cow, and, since he did not want to give anyone any of the meat, he ate it immediately on the spot. Then, in order to quench his thirst, he lay down at the only small pool of water that was to be found far and wide, and drank it to the last drop. When he now wanted to stand up in order to go home, he was unable to move. A lion came and devoured him. That was the punishment for his greed, which granted nothing to the others.

An ol dorobooni had two sons whom he loved very much and for whom he provided as best he could. Every day he brought home meat from hunting and gave them large pieces of it, so that they would become big and strong. When they had grown up, the two went hunting together and agreed that they intended to eat the slain

/267 cont./

• 539 game immediately and not take any of it back to camp for their parents. They stalked the whole day without being able to kill one animal, and in the evening they returned home tired and hungry and were given food by their father. The next day they set out again with the same agreement, and, when they saw no game, one of them climbed a tree in order to look around. Then there suddenly came a giraffe that wanted to drink some of the raindrops hanging on the leaves of that tree. The one sitting in the tree quickly clung to its neck and at the same time cut it in two with his knife. The collapsing animal partially buried him under it, so that he lay there unconscious. Then his brother came and sprinkled him with water, but in vain. Then he cut a piece of fat out of the giraffe and held it under his nose. When the sick man smelled the fat, he woke up; his greed for it had awakened him. The other one now gave expression to his joy over the fact that the sick one could not yet eat, and that he /268/ would be able to consume the huge animal alone and undisturbed, by such excessive laughter that he, too, fell unconscious. Then his brother brought him back to consciousness, just as he had for him before, by the smell of a piece of fat. But he, too, remained so weak that he could not think of eating. Soon the men of their camp came, carried home the sick ones, who were unable to eat anything for several more days, and consumed the meat of the giraffe.

An ol dorobosi shot a big antelope, sat down to it immediately, and ate as much as he was able to gulp down. He hid the rest of the meat for later. Through so much food he had become thirsty and therefore went to look for water. During this he met another man, who led him to the only pool in the whole vicinity. When the latter now asked the former for a piece of meat as a reward, he gave him only a small, poor piece. Then he again returned to the place where he had hidden the meat, in order to eat some more. But with the first bite he choked; he had to cough so hard that something ripped in his stuffed belly. With difficulty he dragged himself home, where he lay still for a long time. This illness was God's punishment for

/288 cont./

• 539 his stinginess. He was very stingy even toward his own children. One day he shot a wild pig. Again he sat down immediately and ate more than half the animal at once and hid the other meat in a tree. He lay down under it to sleep, when the branch on which he had hung the meat broke and crushed his spine.

A lion was friendly with a hyena. The lion killed a game animal every day and left only the bones of it for the hyena. So one day the latter said to the lion: "Do not eat the hearts of the game animals, for otherwise you will fall ill, you have already eaten so many of them in your life." From then on the lion no longer ate the heart, but when it had finished its meal, the hyena came and ate the heart or took it to its young. Now, once when the hyena's children were playing with those of the lion, the latter saw that the former had a piece of heart and mentioned it later to their father. The old lion told them to cry and tell the hyena that it had died. The latter soon came along, sobbing, and wailed over and over: "Who will now hunt game and leave me the heart of the game?" The lion heard this. It saw that the hyena had deceived it, it pounced on it and killed it.

An old blind ol dorobonj whose wife had died lived alone with a small son. The other people of the camp had traveled on, /289/ and the two had been unable to follow them. They nourished themselves mostly on roots and berries, but the child was still too small to be able to search out enough food for both of them. So the old man often had to go hunting, whereby his son led him and directed the bow for him. After the father had shot, the little one always thought he had not hit anything, because the game would run away. But the old man heard it whenever the arrow struck and then sent the child ahead to look for the slain animal.

3:Huntingford E-3 (1921-1928)929 FLA Dorobo FLA

Names.

Before a child is born, the spirit of an ancestor is called upon, and the child receives the name of that ancestor, which he retains throughout his life.[1] An elevenclan, a man becomes *Arap* (*asoon*), "Son of (Bo-and-so)," e.g. a boy named Kipon, whose father's name is Kimirilig, becomes Kipon arap (K)imirilig, and is known as *Arap* (K)imirilig. Both the masculine and feminine names are mostly Nandi.

Circumcision. (Tum,[a] K.)

The customs connected with circumcision seem to be very similar to those of the Nandi. Boys are circumcised at intervals of about ten years; the ceremony takes place after harvest, about October, when extra food is bought from the Nandi; the actual operation is performed in the early morning. In the case of girls, a circumcision is held when there are sufficient girls in a district of an age to be circumcised; only the clitoris is removed. Circumcision, as among the Nandi, and in ancient Egypt, is a form of initiation into manhood or womanhood, and a preparatory to marriage.

Marriage.

It is usual for Dorobo to have only one wife, as they are unable to support more. The price of a wife is paid chiefly in honey-wine. Before marriage the suitor gives to the girl's father so much honey-wine "as four women can carry." He also gives the parents honey-wine year by year after marriage, and he must give the father rope (*sambut*, pl. *sambutsiek*) made of the skin of the black monkey (*Colobus ellipsodactylus*). Nowadays, if a Dorobo has any cattle, he sometimes takes a second wife.

Death.

When a Dorobo dies, his body is taken out into the forest, about 200 to 300 yards from his hut, and left for the hyænas (*kimarokik*) to devour.

Miscellaneous.

When a Dorobo thanks a person, he spits in the direction of the person, with or without saying "*Kongoi*," K. ("Thanks").

The Dorobo call each other in the forest by blowing horns of water-buck (*chemlit*, K.).

Salutations:—

(a) Of greeting:—To men, "*Sopoi*"; answer, "*Chem-le*" (double). To girls and women, "*Tilimongo*"; answer, "*Eji*."

(b) Of farewell:—"*Saisoo*" (good-bye); answer, "*Saisoo ak ingo*" (good-bye to thee), or, "*Saisoo ak ahool*" (good-bye to you).

Except "*Chem-le*" as the answer to "*Sopoi*," these are the same as in Nandi.

[1] The Nandi also give children "spirit names" (*kemet ap ailit*, which, however, are seldom used. Vide infra.

4/Huntingford E-5 (1938-1939) 1951 FLA Dorobo FLA

7. Names

A Dorobo man has normally at least four names: (1) spirit-name, (2) [illegible] (3) nickname, (4) patronymic, though he does not use them all.

(1) Spirit-name. The choice of a spirit-name, *kotut ap ceweekit* (or, *ceik*), may be determined in one of three ways: (a) a pregnant woman may dream that an ancestor of her husband's visits her and tells her to call the child after him; (b) after the child is born, the father calls in his brother and his wife, and one or two other near relatives on the paternal side, and they recite a number of names borne by their ancestors, pausing after each name; when the child sneezes, the name last spoken is given to it, this being one of the ways in which the ancestors indicate their will in the matter of names; a little snuff is blown up the child's nostrils to make sure that it does sneeze; (c) by taking the name of a relative in the next generation but one, as in the case of Arap Maiing's family, whose spirit-names were chosen in this manner:

Father's father:	Kipee	
Father:	Kimining	
Himself:	Kimapa	Kipee
His son:	Tiongol	Kimining
His son's son:	not yet (still in the womb)	Kimapa
		Tiongol

The second and third methods seem to be the commonest, and their use depends on family custom; the first method was described to me, but I believe is seldom used. The spirit-name once given is never spoken, and is known only to the bearer and those who were present when it was given; its purpose is to link the bearer with a specific ancestor, and to ensure remembrance of his name.

(2) Porridge-name. This term is borrowed from the Nandi, who call it porridge-name because it is given at the time when a child is first fed with porridge or gruel (*kimat* are research). There are two methods of choosing this name. The father's parents, if alive, and other elderly paternal relations, meet in the father's hut; they drink beer, which is not shared by the child's father and mother. The father's mother, or some female relative on the paternal side, then holds the child in her arms and says, *Kibaria Nowa*, "we call you [such and such a name]", announcing a name which the relatives have chosen from either (a) some circumstance connected with the child's birth, like the time of day when it was born, or some recent action of its father's; or (b) the name of an ancestor of the next generation but one, as in the case of spirit-names; this second choice is made when spirit-names are not based on the alternate generation system.

(3) Nicknames. This is not an essential name, for all do not have a nickname. When given, it is generally derived from some physical peculiarity or habitual action of the person concerned, like *Kipkurum*, "left-handed", *Kimoroket*, "he cook", *Foregonay*, "bowlder".

Africa Digital Archive 2.0 (2010-2015) 1951 FLA Dembo FLA

(6) The patronymic. This is the equivalent of a surname, and consists of the father's personal name preceded by the word *kimāt*, "son of", though sometimes a nickname is used instead of the personal name. Younger sons, however, do not as a rule take their father's personal name, though they may take his nickname, but often choose a name alluding to some circumstance in their life, as in the case of Arap Maiyo's younger brother Kimutai, who, having had to make a long journey to be circumcised, called himself Arap Ruto, "son of he made a journey". The complete series of names (not always borne, nor always circumcised) belonging to the father of Ole, who was generally known as Arap Ngetuegem, was Pudiaria Sitiki Kipkurere arap Ngetuegem, the first being his spirit-name, the second his personal name, the third his nickname, and *Arap Ngetuegem* his patronymic.

On the subject of naming children, Arap Maiyo said in 1935, "My wife gave birth to a child about three months ago, it is true, but we have not named it yet, because we have not sought for a name, and we shall not do so till she has had another child. When the next child has been born, we shall give this one a name about seven days after the birth of the new one. If she does not have another child, we shall wait till this one can walk, and then we shall name it. But everybody does not do like this nowadays, for Arap Kirui (Lumbwa) has a daughter only six months old, and they have already named it Cepkosi, and his wife has not yet had another child. This baby was called Cepkosi because the father was working on a farm". (Kosi from Swahili *kazi* = work).

8. Marriage with Nandi

Circumstances are forcing Dorobo to marry Nandi women to a greater extent than formerly, and Nandi are also, conversely as it may seem, marrying Dorobo women. We do not know the frequency of such marriages in the old days, but some figure for the present day can be obtained from my census and genealogies. Of 38 recorded marriages of Dorobo with Nandi and other tribes of the Nandi group,

5 were of Dorobo men with Nandi women;
3 were of Dorobo men with Kipsigis and Terik women;
30 were of Dorobo women with Nandi men;
1 was of a Dorobo woman with a Kipsigis man.

Of six Dorobo who married Nandi and Terik women, three lived in Nandi; and of ten Dorobo women who married Nandi, three lived in Nandi. There is thus a tendency on the part of Dorobo men to look for wives abroad owing to shortage at home, and on the part of Dorobo women to marry Nandi because of the poverty of the Dorobo and their occasional inability to find the material for bride-payment, with the result that even the women rarely get married to men more inferior to Nandi.

C46 Name-giving or adoption of names boys, girls, human, married women, parents.

553 The Wandandéi are not so extravagant with names as the Ilmeni. As soon as the upper incisors of the child — boys and girls — come through, it receives from the mother or a small feast a name that remains the principal name for its whole life. As soon as a boy can crawl, the father gives him a second name, with which only he calls him. Neither among the Aré nor among other Wandandéi did the author find names peculiar to these nations, the people here them that we were familiar with among the Ilmeni. To the question as to the reason that determined the choice of names, they usually answered: "An ancestor and wealthy Ilmeni was called that." If all a woman's previously born children died, the newborn child is given the same fetish.

The girl, at her marriage, is given a second name by her husband, outside of whom, however, no one calls her by it. After a brave deed performed in hunting his companions give the deliverer a name corresponding to the one that the at present deceive also killing an enemy in war. The occasion is often the slaying of an elephant, by which the names of other girl or friends refer. The heroes refers to the appearance of the elephant meat, which, because of the white (= silver) fat, looks speckled (gol). The latter indicates that the elephant was shot in the passive rest called ye mele. Another name is ol ehy dole (blame) word), i.e., the one who does not hold back, but rushes ahead. The one who has been away from the camp for considerable time on a greater hunting expedition is called ol dolet upon his return, a name that the one who has joined the Ilmeni for a period of time also receives.

551 After the birth of the first child, the parents are named after it. For example, if the child is called Bolodgon, the father is designated as ang Bolodgon (father of B.), the mother ene B. (mother of B.). After the death of the first child, the parents, in like manner, are [illegible]

• 55 [first sent.] named after the oldest living child. Among the Asá one likewise finds the custom whereby the son, after the father's death, is called by his name.

— [Tone] VII.

600 Circumcision of the boys. -- Age classes. -- Organization of the circumcised young men. -- Circumcision of the girls.

61 The circumcision of the boys and girls is exactly the same as among the Masai and takes place at the same time as that of the Masai boys. The newly circumcised boys (kopolendo, kopolelli) form an age class (olbilodigi), which however is quite distinct from that of the Masai. For two to three years after their circumcision the boys are called kerorig (sing. kererondigi), corresponding to the el kerret of the Masai. When the latter become el moran, the former correspondingly become ildoonyo (sing. ildoonyoni), and later, with their marriages, ildilos (sing. ildilosi), corresponding to the el moruak of the Masai. The kopolendo dress exactly like the el dialio, and, like them, they set out to hunt small birds, with the skins of which they adorn themselves. When the corresponding age class (el kerr) of the Masai gets a new name, that of the Asá adopts it also. They cling to their old customs even when their present mode of life makes them unnecessary. The reason the Wandorobbo have no terms of their own for the age classes is -- also according to their own explanation -- that the el oibonot, whom the Asá also call ollaroq, does not give them any and would regard it as extremely audacious if these poor, despised people came to him with such a request. The olbilodigi also choose their head -- the el ayeyoi of the Masai -- who here is called olig or laiboloja or also oyeyoi. As among the Masai, this is an honorary position without duties, but here without any privileges either. Then the olpiro bilgi, whose rank is chiefly to settle disputes, corresponds to the el oiyeyoni of the Masai. The bilgi corresponds to the el oibonot of the Masai. He is the leader in hunting, especially on larger expeditions, which often lead the young Wandorobbo in pursuit of elephants far from their camp. Only one who, in hunting

1. [Chief of the Masai people, and according to Berber, also chief of the Asa--Amalyet]

Engi is said to have instructed the Dambo to bring him a pair of sandals made of leather having hair on both sides, the Shami to bring him a bell, the thing of which was pure white, and the Dikoyo an animal called Baka (a hamstring ox or antelope).

The Dambo cut off the ears of a donkey, and produced them to the required sandals before Engi; the Shami brought a bell that no sells only; and the Dikoyo the animal called Baka.

Engi then told each tribe to take its respective share and to search the enemy separately and at different points.

The Shami, searching into Dikoyo from Fatmaka, fell upon the smaggers first, and taking all their cash there them as to the Dikoyo, who in their turn drove them on to the Dambo, by whom they were finally caught.

The Shami or Cafe men then disposed of, and sold by the same Engi, which was given to the generation that fought with and expelled them, and by a few women of that tribe, while prisoners by the Dambo, are no consisted of their descendants in Dikoyo. Amongst these prisoners may be mentioned an old woman called Bambiu, who is still alive and resides in one of Bongi's villages. She was formerly Chief Queen's name.

Previous to my the Shami kept all the cattle which they captured, and this caused a rupture between them and the Dambo and Dikoyo, who joined forces and fought war on them. After a time had been made the Dambo and Dikoyo fought amongst themselves.

If the Dikoyo were in fire and between they had to cultivate the ground, and to do so they were obliged to destroy the forests. The very existence, however, of the Dambo depended on the preservation of the forests, and hence arose a struggle for survival, which ultimate of no consequence and could have but one end.[1]

In an incredibly short time the grass prevented forests, the home of the Dambo, were destroyed, and with them this interesting people ceased to exist as a tribe. Engi-nat of the nature of living many died, some took to cultivation, whilst the majority migrated to other regions, where they formed small colonies, such as are to be found at Bongo, Fatmaka, Bertoa, Kijoto, on Lukigia and Mau, at Tororo, in German East Africa, and even, it is said, in places as remote as Kimanyo.—(We also had news to this last place from the Agandian). This scattering of the tribe accounts for the peculiar fact that Dambo living in widely different localities speak the same language.[2] The Bongo, Fatmaka, Kijoto, and Bertoa Dambo, and those of similar colonies still, if questioned as to whom they come from, readily mention Kavirondo and Kisumu[3] as the birthplace of their fathers.

As regards the origin of this interesting tribe, we have little or nothing. They appear to have been one branches, the Agandia and the Dambo; the former formed the game on the plains, the latter in the forests. They lived in pits dug in the ground and covered over with leaves of the wild banana; these give way to day for the more permanent to the Dikoyo country, though of course they formerly built somewhere the same as opposition the forest. They are also said to have lived their

[1] The fact Dikoyo is some how the enemy appear to have been almost entirely congenial persons and they accordingly did not interfere in all with the Dambo. The two entirely into seem to have possessed the whole continent from Victoria Nyanza the right to some place of land or other. The same reason is often put down for their no friend as Dambo were doing as a settled and growing concern to some persons in the same manner as Negro [illegible] the Jews [illegible] they have been put on the map a settled tribe of agricultural people.

[2] Query. Do natives use to speak with Kavirondo tribe the enough generation to signify [illegible] this language?

[3] The country lying between the Nyanza Gulf and Kisumu is Dikoyo.

that one thing he said for both the female and female, and if they are as wife in the kindergarten's settlement it were be promised from respective also. Marriage is prohibited.

Marriage with Fault

Eighteen marriages were recorded in genealogies between Dundee and Fault as members of the Fault group:

Dundee and Fault women: 8	Dundee and Fault men: 10
Dundee and Rose women: 5	Dundee and Rose men: 7
Dundee and Folk women: 5	

Marriage of Dundee women to outsiders seems to be due to the poverty of the Dundee, which in these cases would have meant that the women would have considered an insult, such marriages also mean the cessation of work to the Dundee.

Polygamy

Although there is no objection to polygamy, Dundee settlers have the custom of acquiring wives from one wife or a time, though several cases occurred of re-marriage after a wife's death or desertion. No one genealogy a women had as few lives with successive husbands, none of these her husband's brothers, and her only three was one daughter.

Re-marriage of Widows

Unlike the Fault, the Dundee recognize the re-marriage of widows in the normal manner on payment of bridewealth to their fathers, brothers, or other representatives, it is, however, unusual. Widows normally live with their husband's brothers, return to their parents, or else live alone.

Divorce

Divorce is rare, and is of one kind only, permanent. The husband may claim the return of the bridewealth. But a wife who has borne a child cannot be divorced for any reason whatsoever.

Birth

Intercourse between husband and wife stops at the fourth or fifth month of pregnancy, and is not resumed till the child is about six months old. Birth takes place in the husband's hut, the husband going to live elsewhere nearby. The wife is attended by a midwife, experienced, and the mother in presence of possible. She stays in the hut for six or seven days after the birth, and the child's body meal for that period for several months, while the father living allowed to eat only fat fish. The mother must be purified by her husband, who fetch a good reward for most exquisite ceremony if he has none of the worst and who for the most intelligent grass which from the stomach of her fish, tongues, and belly. Children are weaned at the age of about a year. Twins are not liked, and the mother's chief performance consist by they both must be separated by the killing of a goat which is eaten by the mother and her nearest friends. The Dundee and that if a man has an x may

Children receive their first names, the right-name, soon after birth, on naming the Fault, the name is not used, but they the child and, a preceding spirit. The parent or principal name is given before the child was born, or the day after birth if it has given solid food, and is called "grandpa name" in imitation of the Fault animals. Children may also be given nicknames which allow refer to some physical peculiarity, other circumstance, their favorite things can do, about who calling them

b Huntingford B-4,1 (1938-1939) 1953 FLA Dorobo FLA

patronymic from their father's prestige name. Younger men generally take their patronymic from the father's distinction, or else from some circumstance in their own lives.

Circumcision

Boys are circumcised at the same intervals as the Nandi, and the Dorobo keep watch for the opening of the Nandi circumcision. Occasionally boys are circumcised in Nandi with other Nandi boys, but more often in the forest, as in the circumcision of 1938-39. Sometimes a Dorobo acts as operator for the Nandi. The whole procedure of circumcision (save in detail) is identical with that of the Nandi. Girls undergo the operation of clitoridectomy whenever there are enough ready to be done, and not at any stated intervals.

Age-sets

The Dorobo have borrowed the whole age-set system from the Nandi, and it works exactly as among the Nandi, with the same six names and 15-year intervals synchronized with those of the Nandi. The reader may therefore be referred to the account of the Nandi system, p. 31. A slight difference in the sub-divisions called *mot* may be noted: the Dorobo have only three, called *Lapkitalik*, the senior; *Tapsiret* or *Kipkilionyoch*, the middle; and *Kwondamet* or *Kipkendich*, the junior. A more significant difference is that the sets have no military or political force, for the Dorobo are not fighters, and the practical effect of the system is to introduce further behavioural patterns, as well as to modify the traditional rules of hospitality; for while an Dorobo would refuse to shelter one of his own kinds, the degree of hospitality varies according to the age-set situation.

Previous Generation

Local Divisions

The Dorobo live mainly in their settlements divided between a number of districts or *pororiek* (*koronet*, sing. *koret*). Till about 1906 these settlements were in small clearings inside the forest, after that they were spread round the outer edge of the forest.

The Clan

The clan, *oret*, is an exogamous patrilineal group with a name and a totem, *kwal ap oret*, the *kwond* of the clan. The existence of eight clans is attested by genealogies and the names, three others are reported to exist or to have existed, though none occurred in any records they were, however, mentioned to me in 1937 as well as in 1938-9. Each of these clans has one totem, except that which has three, one of which it shares with another clan; it is not the totem which is important, but the group itself, the clan being a social group, not a group of people mystically related through their totem. The emphasis is therefore on the clan name and not on the animal. Though marriage, nevertheless, is forbidden within the clan, the exception to this rule is found in the case of this, where intermarriage is allowed between people of different totems, an exemption before the possibility to the influence of the Nandi, among whom this marriage are common between people of different totems. (See p. 31.) There exist to be no restrictions either on marriage between [illegible] or on eating or using the [illegible] animals, which suggests that originally the Dorobo clans were totemistic, and that their present constitution is a relic borrowed from the Nandi along with the clan names, which enough [illegible] of the reported clans are all Nandi.

[illegible] Nandi occasionally are spared to this end. [illegible] Nandi word meaning "the name."

4:Huntingford E-5 (1938-1939) 1951 FLA Dorobo FLA

7. Names

A Dorobo man has normally at least four names: (1) spirit-name, (2) porridge-name, (3) nickname, (4) patronymic, though he does not use them all.

(1) Spirit-name. The choice of a spirit-name, *koinet ap ceweriké* (or, *ceik*), may be determined in one of three ways: (a) a pregnant woman may dream that an ancestor of her husband's visits her and tells her to call the child after him; (b) after the child is born, the father calls in his brother and his wife, and one or two other near relations on the paternal side, and they recite a number of names borne by their ancestors, passing after each name; when the child sneezes, the name last spoken is given to it, this being one of the ways in which the ancestors indicate their will in the matter of names; a little snuff is blown up the child's nostrils to make sure that it does sneeze; (c) by taking the name of a relative in the next generation but one, as in the case of Arap Maiyo's family, whose spirit-names were chosen in this manner:

	Porridge-name:	Spirit-name:
Father's father:	Kipus	
Father:	Kimining	
Himself:	Kimnyo	Kipus
His son:	Tiongui	Kimining
His son's son:	not yet (will be) born	Kimnyo
		Tiongui

The second and third methods seem to be the commonest, and their use depends on family custom; the first method was described to me, but I believe is seldom used. The spirit-name once given is never spoken, and is known only to the bearer and those who were present when it was given; its purpose is to link the bearer with a specific ancestor, and to ensure remembrance of his name.

(2) Porridge-name. This term is borrowed from the Nandi, who call it porridge-name because it is given at the time when a child is first fed with porridge or gruel (*koinet ane mosorok*). There are two methods of choosing this name. The father's parents, if alive, and other elderly paternal relations, meet in the father's hut; they drink beer, which is not shared by the child's father and mother. The father's mother, or some female relative on the paternal side, then holds the child in her arms and says, *Kibwris kimwa*, "we call you forth and such a name", announcing a name which the relatives have chosen from either (a) some circumstance connected with the child's birth, like the time of day when it was born, or some recent action of its father's; or (b) the name of an ancestor of the next generation but one, as in the case of spirit-names; this second choice is made when spirit-names are not based on the alternate generation system.

(3) Nickname. This is not an essential name, for all do not have a nickname. When given, it is generally derived from some physical peculiarity or habitual action of the person concerned, like Kipkenon, "left-handed", Kimoroket, "fat neck", Parapkuny, "bandylegs".

4:Huntingford E-5 (1938-1939) 1951 FLA Dorobo FLA

551 (6) The patronymic. This is the equivalent of a surname, and consists of the father's porridge-name preceded by the word *Arap*, "son of", though sometimes a nickname is used instead of the porridge-name. Younger sons, however, do not as a rule take their father's porridge-name, though they may take his nickname, but often choose a name alluding to some circumstance in their life, as in the case of Arap Bleing'a younger brother Kimutai, who, having had to make a long journey to be circumcised, called himself Arap Ruto, "son of 'he made a journey'". The complete series of names (not always borne, nor always obtainable) belonging to the father of Pilo, who was generally known as Arap Ngumuguo, was Paulikio Ndoki Kipkotuno arap Ngumuguo, the first being his spirit-name, the second his porridge-name, the third his nickname, and Arap Ngumuguo his patronymic.

553 On the subject of naming children, Arap Bleing said in 1939, "My wife gave birth to a child about three months ago, it is true, but we have not named it yet, because we have not sought for a name, and we shall not do so till she has had another child. When the next child has been born, we shall give this one a name about seven days after the birth of the new one. If she does not have another child, we shall wait till this one can walk, and then we shall name it. But everybody does not do like this nowadays, for Arap Kotet (Cromwell) has a daughter only six months old, and they have already named it Cepkosi, and his wife has not yet had another child. This baby was called Cepkosi because the father was working on a farm". (*Kosi* from Swahili *kazi* = work).

8. Marriage with Nandi

583 1951 Circumstances are forcing Dorobo to marry Nandi women to a greater extent than formerly, and Nandi are also, conceivable as it may seem, marrying Dorobo women. We do not know the frequency of such marriages in the old days, but some figures for the present day can be obtained from my census and genealogies. Of 18 recorded marriages of Dorobo with Nandi and other tribes of the Nandi group,

5 were of Dorobo men with Nandi women;
3 were of Dorobo men with Kipsigis and Terik women;
10 were of Dorobo women with Nandi men;
1 was of a Dorobo woman with a Kipsigis man.

Of the Dorobo who married Nandi and Terik women, three lived in Nandi; and of ten Dorobo women who married Nandi, three lived in Nandi. There is thus a tendency on the part of Dorobo men to look for wives abroad owing to shortage at home, and on the part of Dorobo women to marry Nandi because of the poverty of the Dorobo and their consequent inability to find the material for bride-payment, with the result that even the women cannot get married in some cases unless to Nandi.

9:Huntingford E-5 (1938-1939) 1954 FLA Dorobo FLA

you are a spirit". A man who kills a snake at night in his hut need not necessarily become ill as a result (as the Nandi believe he will), but the ancestor whose spirit was in the snake will show his anger by never going to see the man again and transferring his attentions to some other member of the family. This would no doubt result in bad luck, for the offender would be continually conscious of what he had done. Another account, however, which I think more nearly represents the common belief, is that after offering a snake honey-and-water or milk, the owner of the hut says to it: *Oi si nyon koo ingoti kokwet*, "Go and return when (my wife) bears a child", so that the name of the spirit may be given to the child. According to this account, if a man should kill a snake at night in his hut, he will probably be ill the next day unless he pours some honey-wine on the floor where the snake had been in the night. This should free him from the danger of illness. Snakes seen in the daytime may be killed without fear.

The spirits also appear in daylight as shadows (*sesut*) and they may make their presence known by slight noises, like the sound of a stick being broken. When a man sees an unaccountable shadow, or hears a noise for which he can see no cause, he concludes that it was a spirit which has come to see him, or perhaps just come up to take a walk on earth. But he need do nothing, nor need he be afraid, for at such times the spirits do no harm.

Before setting out to hunt, a man asks the spirits to help him:

Cowwokik, okkwe kiony ne kiyan,
Apoto, give-us animal which we may kill,
okkwe kwesik ni kiyaiyo.
Give-us honey enough to satisfy us.

Offerings of honey-and-water, *kokwesik*, are sometimes poured on the ground from gourds with a request to the spirits to provide food in times of scarcity. Such offerings are made by people at their own homes when their affairs are going badly:

Cowwokik, apiiyan emalit,
Apoto, fill-us-with food,
ni kiyaiyo sogiet.
That we-may-be-filled-with health.

When a man is very ill, he sometimes sees what he takes to be another man lying beside him for a short time, who is invisible to other people. When he has recovered, he realises that this other man was a spirit who had come to help him to get well, and to take into himself the sickness: *Kimyon ni kwelyo, koro ne koree ole ne aciset, ni kosagh*, "He came to guard him, and lay where the sick man lay, to make him well".

Evil spirits sometimes attack people when asleep and make them ill. They also play tricks on people and do spiteful and irritating things to them. A man is walking, for example, and suddenly catches his foot, as he thinks, in a liana drawn right across the path, and falls. But he finds nothing there, and realises that it was done by an evil spirit. In 1937 I was one night encamped on the edge of the forest between Kipkoreon and Timaya, with

Table of Clans

Clan name	Corresponding Nandi name, and clan by Dorobo	Source	Dorobo totem
Kipsaket *	Kipsaket Bird	Nandi clan	ancient name
Mai *	Mai	Nandi clan	ancient name; Dorobo ancestor had two
Kipsiker *	Kipsiker	Nandi clan	baboon
Kipsomet *	Kipsomet	Nandi clan	duiker
Kipsiz *	Kipsiker	Nandi clan	bush pig
Tuiyot *	Tuiyot	Nandi clan	rats
Kimnyo *	Tuiyo	Nandi clan	hyrax
Tuiy *	Tuiy	Nandi clan	lion

The clans omitted here are: "Kipsongol," corresponding to the Nandi Kamoiboi, name particular Kipsiker," corresponding to the Nandi Kipsiker, totem the sun; and Kimpo, apparently Dorobo name, totem snake.

(All names marked * are of Nandi origin.)

The clan is the basis of political organization, and people tend to live in clan settlements under the control of a clan council. The council consists of all the old men of the clan. Legal cases are heard by a chairman who, upon notice being given to him, prepares honey-wine or beer, for the business of the council is done in an informal way with a pot of honey-wine as it is over a social gathering, which it is more or less. Disputes is done first and the drinking follows. The council deals with clan matters, including disputes between members, boundaries of hunting areas, homicide of a clansfellow, incest, and the preliminary arrangements when a clansman has killed a member of another clan. Disputes are settled by discussion, and the result is announced by the council leader, Kimnyikindet, who is not necessarily the oldest member of the clan, but someone fairly senior who acquires the position to which the name may go down the Nandi pattern (p. 58).

The Ward

Superimposed on the clan areas is a system of districts (kororosik, sing. koro) governed, due to Nandi influence. Each district includes several clan settlements, and has a council made up largely of the elders and circumcised men of all the clan settlements within it, the council who order a tree (there are no special council trees) in an open space has which the Nandi has been shaved. The function of the koro council is to handle inter-clan affairs. It has a leader, also known as kimnyikindet, whose position and duties resemble those of the leader of the clan council, and he succeeds his office in the same way. There was no chief of the Dorobo.

The koro is divided into nine territorial wards (from north to south), Cheptuiy, Kaiyet, Kony, Kipkoren, Tuiyoo, Kimnyo, Kipsigis, Pure, and Tuiyo. In 1938 only three of these were occupied: Kaiyet, Kipkoren, and Tuiyo (which had by that time encroached into Nandi).

Legal Sanctions

Crimes against which primary sanctions are directed include incest, witchcraft, and disobedience to the council. Secondary sanctions deal with trespass, theft, bush-

4:Huntingford K-S (1938-1939) 195: PLA Dorobo PLA

normally go elsewhere for the night, leaving the last to the men. In the matter of hospitality, relationship by blood, marriage, or clan is a deciding factor in the length of time for which a man may expect to be put up by his host. Thus, no matter what the age-set situation may be, a man who is neither a relative nor a clansman cannot claim more than two nights' hospitality on account of necessity, and will not be given honey-wine; while a relative or clansman may be fed for a week or even longer, and the host will give him honey-wine if he has any.

3. Behaviour

A brief summary of the modes of behaviour towards important relatives was given by a Dorobo in the following words: *Mukiosyo gaqua ne kwisa a kajisa kakwai*; *mukiosyo kakony gaqua*; *mukiomuni kachai ak aiya mukik ar ewosi, amma ga, ngai mukik ap kamwisi*; *kiwomwechini kakwai*. ("A man does not use bad language to his father, though his father may beat him as a child, nor does he use bad language to his father's brother; he does not speak of dirty things, nor of sexual matters, to his mother and his mother's sister, for it is bad to do so; but we all play together, i.e. we are on terms of friendliness and 'shun fun'.") Generally speaking, seniority is a matter of age, except with respect to the father's brother and men of senior age-sets.

It is unlikely that any Dorobo ever saw his father's father's father, and the father's father is seen only by small children. The father's father is regarded much as one's own father. But the father's mother helps to the care of the children, and so becomes an object not only of familiarity but of affection as well to the children. To all of the father's generation a man should show respect and obedience. He must not insult them, nor use unsuitable language in their presence. Corporal punishment may be inflicted on a male or unchivalrous child with the hand or with a stick, by father, mother, and father's brother. Verbal correction is also a common method of dealing with naughty children, and though a man would not as a rule say to a naughty child who had made him angry anything as drastic as *Awos ekidet* (may you die of dysentery), in case the spirit-world took him at his word, he might go as far as *Iwo gwi* (get out), an expression which if used by a child to a senior would certainly earn a beating.

Most Dorobo are fond of their parents, and treat them in old age with much kindness and consideration. Wherever I found aged parents living with their sons it was the same; and the more helpless the parent, the greater the trouble taken to make them comfortable. The old father of Pilo, to whom I have already referred, was such a one. Semi-deaf, hardly able to move without help, he spent his time lying outside in the sun when it was warm, and indoors beside the fire when it was cold. He had to be helped to and fro, and fed and looked after like a child; but it was all done cheerfully by Komoiso and his wife, to whose hut the old man lived, and if they could not attend to him, Pilo and his wife did.

father (if he lives nearby), to his brothers, and lastly, if there is any over, to his clansmen in the settlement; so that a man who gets a pound or so of Kavirondo tobacco does not keep much of it for himself.

Drink, mainly in the form of honey-wine, is prepared not so much for private consumption as for social gatherings. It is used in various magico-religious performances, and as part of the bride-payment. When a man is visited by a friend or two, he gives them honey-wine; when there is a clan council, honey-wine is drunk; and when men and women meet for a wedding or a morning they drink honey-wine. It is thus an indispensable part of Dorobo social life. When a man wants to relax, he lies down and goes to sleep, but his amusement is composed of social gatherings. Visiting, conversation, and clan councils in fact provide him with his entertainment, and conversation and gossip seem to take the place of games and dances. I saw no sign whatever of the game called *kerandi* by the Nandi, which is played with seeds or pebbles in holes in the ground or in a board, and never heard it mentioned. I neither saw nor heard of a dance, and I never once heard a Dorobo of either sex singing.

The principal standard of wealth is really a man's skill as trapper, hunter, and bee-keeper. But the products of this skill are perishable, and formerly the only way in which tangible wealth could be accumulated was in the form of weapons, honey-barrels, and dogs. Now that the old hunting conditions have gone, it is becoming possible for a man to accumulate wealth to a very limited extent in cattle or goats, which he can get by purchase, gift-exchange, or through bride-payment. The use of money has just become familiar, and a certain number of Dorobo earn wages; but except for one or two who have joined the Police, wages are not high, and the average is little more than 7 to 10 shillings a month. So far the Dorobo have had little inducement to work for wages, except that by signing on as squatters for a small wage they can acquire a temporary right to live on what was their own land. Beyond the fact that money enables them to buy a little extra food, our idea of wealth means little or nothing to them, and they have not yet advanced far enough into the transitional stage for it to be anything more than a small supplement to their traditional way of living. It is all that they can do to maintain themselves, let alone accumulate reserves or surplus wealth.

The transitional stage which the Dorobo had reached by 1939 is that from hunting to agriculture, with at the same time a strong desire to acquire cattle. It is sometimes suggested that hunting peoples like the Dorobo are really agriculturalists or pastoralists who have had to give up their agricultural or pastoral way of life and take to hunting. This may be true of some, such as the 'Okiek Dorobo' in parts of Kenya who are merely outlaws and fugitives from various tribes. But it is quite clearly not true of the real Dorobo.[1] The Dorobo who form the subject of this paper, who are unmistakably non-pastoral and non-agricultural. Their basic hunting tendency is shown by their character and behaviour, by their hunting techniques and skill, by

[New] VII.

600 Circumcision of the boys. — Age classes. — Organization of the circumcised young men. — Circumcision of the girls.

[illegible] The circumcision of the boys and girls is nearly the same as among the Ibibio and takes place at the same time as that of the Ibibio boys. The newly circumcised boys (ngwobenge, ngwobofig) form an age class (ebibenge), which hereafter is named from that of the Ibibio. For two to three years after their circumcision the boys are called henneng (dog, henneneng), corresponding to the ei henek of the Ibibio. When the latter become ei ndiong, the former correspondingly become ndiong (dog, ndiongng), and later, with their marriages ndiong (dog, ndiong), corresponding to the ei nnenek of the Ibibio. The ngwobenge live exactly like the ei ebibio, and, like them, they go out to hunt small birds, with the skins of which they adorn themselves. When the corresponding age class (ei henek) of the Ibibio get a new name, that of the Ad-ampis is also. They cling to their old customs even when their present mode of life makes them unnecessary. The names the Wandoffos have as names of their men for the age classes is — also according to their own explanation — that the ei ebibio, whom the Ad-am call ndiong, does not give them any and would regard it as extremely unbecoming if some poor, impious people came to him with such a request. The ekpukpog, who chases furs [illegible] — the ei nnenek of the Ibibio — who have to collect nuts or bananas as also nnenek. As among the Ibibio, this is an honorary position without duties, but have without any privileges either. Here the group ikpap, whose task is chiefly to assist digging, corresponds to the ei ngwobenge of the Ibibio. The ikpap corresponds to the ei ndiong of the Ibibio. He is the leader in hunting, especially the large expeditions, which often lead the young Wandoffos in pursuit of elephants for [illegible] their camp. Only one who, in hunting

* [Chief of the Ibibio people, and according to Barker, also chief of the Ad-am-Ikwerre.]

father (if he lives nearby), to his brothers, and lastly, if there is any over, to his clansmen in the settlement; so that a man who gets a present or an ox of Kondi, whoever does not keep much of it for himself.

Drink, mainly in the form of honey-wine, is prepared not so much for private consumption as for social gatherings. It is used to cement neighbourly relations, and as part of the bride-payment. When a man is visited by a friend or two, he gives them honey-wine; when there is a clan council, honey-wine is drunk; and when men and women meet for a wedding or a naming they drink honey-wine. It is thus an indispensable part of Dorobo social life. When a man wants to relax, he lies down and goes to sleep, but his amusement is composed of social gatherings. Visiting, conversation, and clan councils in fact provide him with his entertainment, and conversation and gossip seem to take the place of games and dances. I saw no sign whatever of the game called *kerenik* by the Kondi, which is played with seeds or pebbles in holes in the ground or in a board, and never heard it mentioned. I neither saw nor heard of a dance, and I never once heard a Dorobo of either sex singing.

The principal standard of wealth is really a man's skill as trapper, hunter, and bee-keeper. But the products of this skill are perishable, and formerly the only way in which tangible wealth could be accumulated was in the form of weapons, honey-barrels, and dogs. Now that the old hunting conditions have gone, it is becoming possible for a man to accumulate wealth to a very limited extent in cattle or goats, which he can get by purchase, gift-exchange, or through bride-payment. The use of money has just become familiar, and a certain number of Dorobo own wages, but except for men or two who have joined the Police, wages are not high, and the average is little over 7 to 10 shillings a month. So far the Dorobo have had little inducement to work for wages, except that by signing on as squatters for a small wage they can acquire a temporary right to live on what was their own land. Beyond the fact that money enables them to buy a little extra food, use this of wealth means little or nothing to them, and they have not yet advanced far enough into the transitional stage for it to be anything more than a small supplement to their traditional way of living. It is all that they can do to maintain themselves, let alone accumulate reserves or surplus wealth.

The transitional stage which the Dorobo had reached by 1939 is that from hunting to agriculture, with at the same time a strong desire to acquire cattle. It is sometimes suggested that hunting peoples like the Dorobo are really agriculturalists or pastoralists who have had to give up their agricultural or pastoral way of life and take to hunting. This may be true of some, such as the 'Ogiek Dorobo' in parts of Kenya who are mainly outcasts and fugitives from various tribes. But it is quite clearly not true of the real Dorobo[1], like those who form the subject of this paper, who are unmistakably non-pastoral and non-agricultural. Their basic hunting tendency is shown by their character and behaviour, by their hunting techniques and skill, by

[1] Cf. my remarks in *JRAI*, 69, 1939, p. 172.

4.3.2 the absence of pastoral and agricultural habitations and cultivations, for both myths, and in fact for everything about them. Today it is true that they are becoming agriculturalists, as the following analysis of their economic activities will show:

[4.3.2] [3.1.4]					
	Men:	Trapping game in the forest Making weapons, tools/tools, etc. Both: working for wages		Cultivation of shambas	
Family	Women:	Preparing the meals of trapping Making baskets, mats, clothes, etc. Household and food collecting		Cultivation of shambas	Both
[3.1.1]	Children:	Weeding Hunting Housework			
[3.1.2]	Men Living Alone:	Trapping Making things Preparing the meals of trapping Cooking housework		Cultivation of shambas	Both

● [3.1.4] Therefore this Canadian anthropologist, with a hunting background, and much to view as the ultimate achievement, that though the hunting instinct is still very much alive, and though a great deal of time is now spent on cultivation, there is no doubt that the Chenchu (in 1939 at least) had a consistent economy in their pursuit of the ultimate goal.

3. Economic Activities

a. Purchasing

[3.1.1] [3.1.2] [3.1.3] [3.1.4] Money is to the Chenchu what milk is to the Dumb. It is sent-sacred [illegible] has a high ritual value, in consequence of which certain rules exist to [illegible] but the majority fall. A person dead and are true as blood as the sons they that he has eaten honey, though he or she may eat meat. After eating honey, like of the comb must not be left lying on the ground, but must be hidden in the undergrowth. Every Monk will, [illegible] unconsciously, that the reason for this law "that other people shall not see them and so be led to your honey-hunt". But this is probably not the true reason, which may be other simply respect to the honey, finds a law that if married disrespectfully the majority will fall; or else fear of a which pointing a spell on the bees or honey

[3.1.4]

Fig. 9. Plan of a Dundee dhumba or hulpa showing a Fresh dhumba.

or Kipsikay in 1938 the crop was so much damaged by monkeys, pigs, and a sort of mole called dreemal, that the original dhumba had to be given up, and the occupiers took up new and separate plots elsewhere. Sometimes a Dundee has a dhumba all to himself; more often, however, several people divide the area inside a hoop, each contributing to the labour of making it; and in some cases Dundee share part of a brand dhumba with Fresh (Fig. 9).

Though not connected with cultivation, we may mention here the subject of earth digging, because it is concerned with the ground. But not white earth to boast over Thirteens (or Fourteens, as the Dundee call it), and men go in parties of four or five to dig it. They use nothing but a digging stick, dawot, made of a sharpened ender, and the earth is carried home in large leather bags, by turned days, when other Dundee tend to the earth-producing ones, a digging party would ask leave to dig from the ones who owned over that tract of land, and though we for some to have been part, it is said that if a man should refuse the request, the party would go home without digging. But as no Dundee ever live there, this could not be verified. Today the Dundee sell coloured earth to the Fresh, who pay them at the rate of 3 shillings for a large bag of earth. Red earth, ordeet, is used mixed with fat (or sometimes cassava oil) for rubbing on the head; white earth, cooroh, is used as a magical remedy in cases of toothache.

4. Cattle

If the Dundee had ever been in such close contact with a people whose primary interest is the soil as it is possible that they would have commenced themselves with agriculture and active trade. But their relations with the Fresh have inevitably led them to take an interest in cattle, and to think that the possession of cattle is a desirable thing. Therefore they are slowly trying to acquire cattle, and are in process of making them their ultimate objective. But

Cunningham R-5 (1936-1939) 1953 FLA Durobe FLA

they have been stock-owners for too short a time, and on too small a scale to have formulated or developed any cattle customs of their own; they do not think (like the Nandi) in terms of cattle; and their main efforts are at present concentrated on trying to acquire cattle. For the last, three ways are open to them, all slow and laborious: bride-payments, gift exchange, and purchase.

Bride-payment. A Dorobo whose daughter is married to a Nandi receives for her the number of stock that a Nandi would give for a girl of his own tribe, i.e. 1 cow and 1 ox or bull, together with a variable number of goats; and when a Dorobo marries a Nandi woman he has to pay at the same rate. Arap Kotet acquired his cattle from the marriages of his three sisters: the eldest, Kipsetkoony, was married while his father was still alive, and on the old man's death he inherited the cattle paid for her; the other two, Cosom and Tegwando were married after their father's death, and the cattle for them (amounting in the case of Tegwando to 1 bull, 1 cow, and 5 goats) was paid to Arap Kotet.

Gift exchange. Nandi from time to time make friends with Dorobo chiefly for the purpose of getting honey. The first move after two men have come to regard each other as friends, *ormat*, is for the Dorobo to give the Nandi some honey, without expectation of any immediate return. After a time, the Nandi gives the Dorobo a goat, and thus the way is prepared for the handing over of cattle. Arap Mitin became the friend of a Nandi at Ollessos called Kapkilo, and eventually got from him an ox in exchange for a fur cloak; and on another occasion he got an ox in exchange for seven goats which he bought with his wages for working on a farm. Arap Korsera in his youth hunted at Kaptyet in Nandi, and shot over monkeys, from which he made fur cloaks which he exchanged for cattle. To-day he has five head of cattle which are herded for him by a Nandi named Kipkorir arap Sowen on Farm 1079: the Nandi looks after them in return for the use of their milk, Arap Korsera being given a small amount of it. This process of acquiring cattle is, of course, a form of purchase, but it is purchase under the peculiar conditions of forming a friendship by exchange of gifts first. The Nandi do not readily part with their cattle, and it is therefore necessary to lead up to the final stage, as the Dorobo regard it, by the preparatory exchange of other things. And as a method of acquiring cattle it is limited by the fact that the Nandi were willing to exchange only male stock in this way, so that for female stock the Dorobo have to rely on bride-payment.

Purchase. The Nandi do not sell cattle to the Dorobo except as just described, that is, in the form of bride-payment or by exchange. But they will sell goats for cash. The Dorobo do not seem to care about sheep, [illegible] in 1929 were preserved any.

At the time of their move in 1917 the Dorobo were credited officially with a large number of cattle, some [illegible] head in fact. But in 1929 the actual numbers that I saw and counted (and I have reason to believe that these were practically all they had) were very much smaller. The following list, while it may not be perhaps completely accurate, gives a true idea of the real numbers. It will be noticed that there were few goats; some were undoubtedly

[P 191, A]

Apart from the rule of exogamy, there are certain other marriage regulations:

1. A person may not marry anyone who comes into the elder or relationship [except F. Sis. D. D.], that is, anyone addressed by a relationship term, or an enyam.
2. A man may not marry his wife's sister because such unions are thought to be erotic.
3. A person may marry into the clan of his or her M., M.M., B.W., or Sis.H.

Pre-marital intercourse with anyone in the clan is forbidden; but with a classificatory enokwond, though not approved of.

The shortage of women and the lack of wealth have resulted in the Dorobo being largely monogamous, though if a man has the wealth, he may have more than one wife. The *kokoo* (bride-price)[1] is said to have been formerly 4 cows for slaughtering; today it is 1 cow, 1 ox and 4 goats, which go to the bride's father and become his personal property. This *kokoo* is high for a people who own little or no stock; but by means of gift exchange cattle can be obtained from the Nandi (See below, p. 192.) Rarity of divorce is another result of this shortage, and since a wife is something comparatively hard to come by, she is more cherished than is usual among other peoples where women are plentiful. The inability to get wives has produced a tendency to what may be called *mendeki*, that is, unmarried men (some of whom never marry) live entirely alone, and do all their domestic work, as well as hunting and cultivation, without assistance.

III

ECONOMIC LIFE.

A. Environment.

The home of the Kapchepkendi Dorobo is the western end of the high ground which occupies the country between Elgon Ravine and the Nandi escarpment. The greater part of it is covered with dense forest, and is crossed on the S. W. corner by two parallel paths from Kipkoreon in the north to Ndarawet in the south. The forest begins about the 8,000 ft. contour, and to reach it from any side entails a steep climb of

60.

Interment of the corpse. — Hereditary succession.

The interment of the corpse differs from the practice customary among the Ibeni only insofar as the poverty of the Ifuli affects it. They neither hold a funeral feast nor do they anoint the corpse with fat. Wealthy people, i.e., those rich with numerous progeny, are here buried by women, and, to be sure, in the bush near the hut, so that after death they may hear the conversations of their children and enjoy the fragrance of their meals. All other corpses are simply dragged out of the hut and put down approximately 100 paces from it. If the corpse has not already been devoured by hyenas the first night, which, moreover, is said not to happen only rarely, there is reality these canine scavengers roam about the wealthy but unwilling corpse every night. *Then* does one have at his offering the centre of the heavy beer, consisting of rice porridge, beside the corpse. A burial of corpses outside the camp is not customary anywhere. The prayer beside the corpse of a twenty-fallen can have [illegible] approximately the [illegible] was and above about the Ibeni beside for the mourning.

In the right of succession the same principles hold as among the Ibeni. The independence of the goods left behind, however, often makes a division among those entitled to inherit impossible, and one can therefore very often observe in practice that the eldest son of the principal wife receives the entire inheritance consisting of farms, women, and livestock. The latter form the principal part of the estate and, after the death of a man, are distributed among the sons in the same way as the cattle among the Ibeni. Just as the latter gives each of his wives a number of cattle to care for and enjoy the use of, the *ni ibeshwa* leaves each of his wives a part of his livestock, which the one of the wife is sometimes then (Ibeni). Widows as a rule join a man of their age class and live with him. Surviving daughters pass into the possession of the eldest son insofar as the bride price is to be paid to him upon their marriage.

[illegible]

THE MAKERS OF KINGS (ABRIDGED)

Theory

The group described by Lambert as living at Endlu on top of the mountain on the edge of the Great Desert of white earth at Lipsony, is that shown at Endlu in Andersen 1911.[1] It was seen by Thompson in 1909 at the place known to the Endlu as Mwanga ("place of hailstones"), which, he says, is Endlu village now established for selling food bought from the Kikuyu in the Mount and the natives.[2] The group is part of the Kikuyu Endlu, who occupied the land before the Kikuyu came. The groups to which the Endlu had completely lost their land by 1909 were taken granted through a covenant set by the Kikuyu Land Commission as one "purity of alliance and partnership and purity of adoption and absorption, purity of population, and height of trees and christianity."[3]

Organization

There are no chiefs, control being in the hands of a council of elders, with a leading elder called Mundumbiri, or among the Kikuyuyumbi. Marriage is prohibited, and blood prohibited. Polygamy is prohibited. There are circumcision, and girls are prepared in circumcision. Their appears to be some sort of age-set system, but Lambert's statement is not very clear on this point.

"There are said to be nine clans, with Kikuyu-sounding names beginning with the prefix Mo-, which does not apply exclusively, but usually means "people of". These clans are sometimes referred to by Kikuyu clan names, as Kikuyu also appear. The word for clan is mo-bumi, derived from the Kikuyu mo-ruguru, "clan", and mu, as Lambert suggests, from mo-ndeko, which means not "people of" but "side group".

Religion

A so-called supreme being called Ngai[4] is recognized, and the elements describing ancestral spirits as "active members" of a lineage implies the existence of an ancestor cult.

Sources: G. G. Lambert, The customs of land tenure in the Kikuyu Land Unit, Part II. History of the tribal occupation of the land, pp. 41, 46.

[1] Op.cit., p. 2.
[2] Journal Royal Anth. Inst., p. 395.
[3] Ngai, Lord, Commissioner, Kikuyu Tribe, p. 42.
[4] i.e. Kikuyu word, "divine".

When a man is ill and dies, it is said that bad milk (with the gods, P.) have killed him; if he recovers, a good minister has saved him. Its offerings are made to the bad milk.

There is also a vague belief in a future life. A man's spirit is said to go at death to the lower sky and (P.), on hand of the spirits, which is under the earth, and is a bad place.

Magic.

There are magicians (*pendiatin*, pl. *pendi*, P.) who can heal, and who prevent people from getting hurt by means of their spells. There are also thieves (*ubiagan*, pl. *ubiadi*, P.).[1] There is an equivalent of the modern Dutch custom of "asking water" on sale by a medicine-man.

Medicines and Charms.

(a) *Medicines.*—The medicine, the gods of the forest love to smell, mixed with the honey of a species of bee, called "*kwesuyen*" (P.), and man's fat. This medicine is rubbed on the affected part, and a little is also eaten. The magic, a ghost called "*ogolin*" is charmed; this is used for all these complaints.

(b) *Charms.*—Children wear a charm to ward off the evil eye (*adire*, P.), which is similar to that worn by Dutch children. It consists of a necklace of seeds of the *kpeyeyeni* tree (*O. kpeyeni*), strung on a cord, the ends being separated by short pieces of bamboo (Text-fig. 9A). Old men wear a charm to keep away thunderbolts (*kwadiagan*, or *kwedin* (*kwedin*), P.). It is made of two small pieces of the shoulder bone[2] about 1 in. long, which are tied to the left (Text-fig. 9B).

V.—Social Conventions.

Social Divisions.

The male sex is divided into boys (*kpedi*, P.), members (*wenendi*, P.), and old men (*gwinedi*, or *ogwinedi*, P.). the female sex into girls (*kpe*), and women (*kwenedi*, or *dogwadi*, P.). An unmarried boy becomes a member and a girl a woman.

Married and unmarried people sleep separately. Married people and small children may sleep in the same hut, while unmarried men sleep elsewhere, often in the *ogbodoni* (P.), or "men's hut," where they cohabit with the unmarried girls. Though this form is practised, it is not carried to such an extent as among the Dutch, and although girls sleep with members, they like to preserve their virginity till circumcision. Members frequently marry their sweethearts' guardian. If women, charms to Dutch men usually marry unmarried girls.

The position of women in the same as it is among the Dutch, that is, they rank as the men, do all the menial work, and are their husband's property.

[1] The word is not used with the same sense in Dutch, originally it seems to have meant "medicine-man" (Dutch *agrigan*).

[2] *Angularis scapulæ*.

[illegible] G. W. S. Dharmasiri—Mahara Pradesh / Home Assessor of

Class.

6.14 The Deaths have eight close pairs (8 sentinels, 8), which correspond to eight of the Fourth class :—

Name.	Name.	Meaning.	Corresponding Fourth Class
1. Mar	5. Kapiya-ra (Pr.)	Crystal stone	Mar.
2. Kalagani	6. Kumbi-liya	Mahara	Kalagani.
3. Kumbara	7. Kaara (Pr.)	Mahara (M)	Kumbara.
4. Kalamalla	8. Kaamara (Pr.)	Mar	Kalamalla.
5. Kaal	9. Kumbi	Cattle	Kaala.
6. Kalkara	10. Kalamalla	Kumbi	Kalara.
7. Kumbaali	11. Kaara-yaka	Kumbiliya	Kumbaliya.
8. Kalamba	12. Kaara (Pr.)	Pig and	Kalamba.

The 3rd class is the most numerous.

Consonantic Ages.

● 6.15 There are some consonantic ages (Kalalu, pl. Kalanagalu), which have the same names as in Fourth ; the intervals between the ages are eleven (11) years, and they succeed one another in a recurring cycle of eleven 11 years, as in Fourth, except that the Fourth intervals are 10 years (formerly 12 years). The present value of the ages, and their names, are as follows[1] :—

1. Mara (very old man)								
2. Kalamalla								
3. Kalgalkaali								
4. Kalanajiba								
5. Kumaaja (mankind)								
6. Mahar (boys)								
7. Kalara (small children)								

The 4th most ignoble of an eighth age, Kalanajiba or Kalanaliy, which has fallen out of use.

Each age is divided into three divisions (mar, pl. manimaali (M.)), or less, which are called :—

1. Kalara—Kumaaja (pl. (M.) Kalajanaa, or Kalajan-aja).
2. Kalalu—Kalanaliy (pl. (M.) Kalanaliy)[2].
3. Kalara—Kumaaja (pl. (M.) Kalanaliy)[3].

[1] In Fourth, Kumaaja is a "woman's name" for the Kumaaliy class. It would have all its class-days for both class-group.

[2] In the Kalalu division of Fourth, these names are called also "Kalanaliya" and "Kalanaliya."

[3] See 6.13 (a), (b), (c), (d), (e) Kumaaja-Kalara is 1-2-3-4-5, only 4 divisions.

...ange Basin. There were also two still younger, matrilineal sections of Asaa [5.3]
...Mining and Cephalosi section of Cassandra. With these lived Cassandra's young ...
...ngaso Cephalosi, aged about 10, who helped her brother's wife to look after [5.4]
...the new children, and slept either in her mother's hut, or in the hut of ...
...Cephalosi, acting with her mother or with Cassandra and his wife. The three ...
...sons Bakaboro, Kipsang, and Kimosi lived together, acting with either of ...
...the old women (constituting their share of the hut), while Kipsaagat lived ...
...alone, acting with his mother. Cephalosi could marry none of these young [5.5]
...men, since they were all her classmates. Such an arrangement allows to [5.6]
...quite usual when a girl has reached puberty but has not yet been circum- [5.7]
...cised. At Sosiyon a seventeen-year-old girl named Cheptoy lived in a small ...
...hut (afterwards) with her youngest brother Kiptoo (p. 2.444). When she ...
...went visiting to the neighbouring settlement Kibaaroo she stayed with ...
...women there also, when they came to Sosiyon, slept in Cheptoy's hut, the ...
...boy going out to sleep elsewhere.

Where other relatives are concerned, the age-set behaviour pattern [5.8]
...tend to replace those of kinship, and even where people are related and within ...
...the taboo they are the practical purposes little more regarded than fellow- ...
...Kalenjin. Indeed, in a few settlements, such people have more influence ...
...and effect on their neighbours' children than blood-relatives who live at [5.9]
...a distance.

In a primitive people like the Nandis there is little formality in the [5.10]
...educational system, which consists largely of training in obedience, behav- ...
...iour, and techniques, which are learned from the parents and others with ...
...whom the child comes into contact. These contacts are not large owing to ...
...the nature of the country and the social system, and thus the relations ...
...with whom a child is primarily concerned are few. This narrow range ...
...of contact must be considered in the light of such important factors as the ...
...absence of books through the lack, the restricting of initiative, and the ...
...abnormal shyness and suspicion of the Nandis.

Up to the age when a child can be of some help to its parents, both [5.11]
...boys and girls are mainly with their mother, who teaches them the business ...
...of eating and living in a hut. She corrects children but rarely and makes ...
...them familiar with the ordinary customs and proprieties of every day life [5.12]
...that have to be observed in Nandis surroundings. The father corrects ...
...improper behaviour towards himself and his wives.

Then at the age of seventeen, which varies a little before the exact [5.13]
...puberty, and depends on the child's growth and intelligence, there is a ...
...division of duties between the parents. The father begins to teach the son ...
...the elements of hunting and trapping, how to make things of wood and to ...
...skin animals, and how to use a bow and arrows, to shoot, how to follow ...
...the a man and his man's mark. The mother teaches her daughter how to ...
...manage a home, how to look after small children, and how to perform the ...
...menial tasks of a Nandis woman. At this stage both boys and girls are ...
...to the support general servants of the family. They have to look after [5.14]
...their father may possess and make themselves useful about his homestead

The parts played by the grandfather or grandmother, and by the father's brother and his wife are directed largely towards instruction in behaviour and morality, though a young married male may often help in teaching boys the elements of woodwork and hunting. And although the father and mother train their children to distinguish between right and wrong, and look to fathers to their relatives, the grandparents in particular have a great deal to do with this aspect of education.

The part played by relatives or strangers is in general limited, for it depends upon the type of settlement and the number of them with whom the child is able to have contact. Where the settlement is a purely family affair there will be no strangers immediately at hand, and it is only in the settlements that their influence can be at all effective. An Eulgai there may be 1000 a settlement consisting of two elementary families and five unrelated characters, but at Kitavetava a widow with two small children would have to find other characters for help in bringing up her children, as well as to have other widows and a young girl. In such circumstances children will have more to do with characters than with relatives. This differs from the Fijian, who do not live in close settlements and among whom characters are much less important than relatives in their relations.

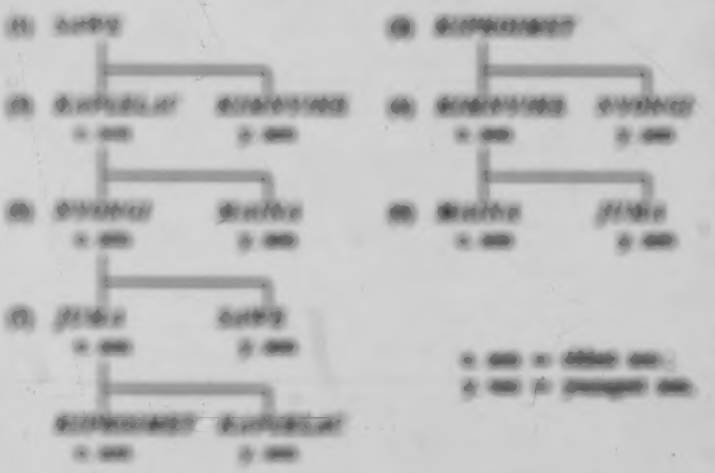
3. The age-set system

In all forms of training, a proper standard of behaviour is imposed upon, training without due attention to this, no attempt at duo or family is possible, and hence there can be no bonds solidarity. Theoretical law of kinship favours that if the behaviour of members towards each other is not carefully governed and strictly regulated, and as behaviour in the business of social life. It must be considered not only from the point of view of a man's dealings with his relatives, but with respect to the different generations with which he comes in contact, and the effect of the age-set system on these relationships must therefore be taken into account. Age-set and kinship rules may actually be in conflict, and so it is necessary before going any further into the subject of behaviour to see how the age-set system works among the Trobs.

Age-sets, grade, plan, dimensions, are an Eastern institution adopted by the Trobs and Dobu, and borrowed from the Dobu by the Dawada. The principle of the system is that the males of the tribe or locality are divided into a number of groups or sets of individuals whose ages all fall within certain limits, and the sets are set progressive like the age-grades or stages through which the individual passes from birth to death. Thus a Trobs man passes through the successive stages of boy, circumcised man, and old man; and a woman through those of girl and woman. But age-sets are more than this for a man is born into a set, and in that set he remains for all the irrespective of the age in years, women, moreover, are not have age-sets, but as marriage refer to themselves as belonging to their husbands' age-sets.

The Dwarka have borrowed this system from the Kwoki, and have taken over both the Kwoki system for the sets and the interval between them, which is fifteen years. There are seven sets which mark a recurring cycle of about 105 years, the names being permanent. Starting with the senior age-set, the order of names in 1938 was: Kiphomet, Kiptilim, Kimoyotik, Kyungi, Kiptala, Jiawo, Kaino.

The general rule is that a man belongs from birth to the set next but one before that of his father, so that the son of a Jiaw will be Kiptilim. This applies normally to elder sons. If a man has several sons, or if there is a long interval between the birth of his eldest and the birth of his youngest, the latter normally belongs to the set next but one before that of his father, so that while his eldest son of a Jiaw will be Kiptilim, his youngest will probably be Kimoyotik, and that of a set junior to that of his eldest brother. This is an important point, as it affects the whole system of behaviour. The following diagram illustrates descent by age-sets:



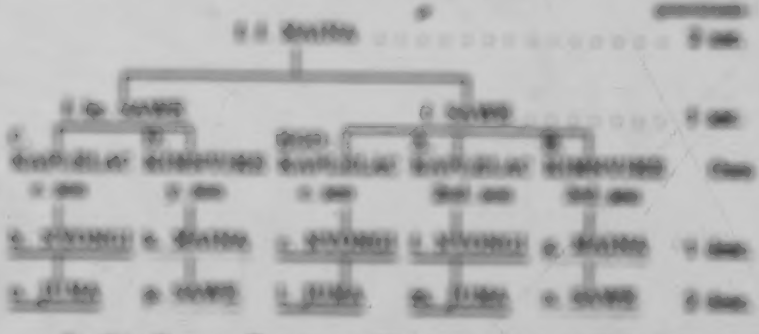
Age-sets work in the following way: the men who complete the present Jiaw set began their circumcision period in 1903, and were circumcised at intervals during the next seven years, after which, in 1910, they became the active and responsible members of Dwarka society, and took predominance the Kyungi retired from public life. In this year, in 1910, the next batch of youths, the Jiawo, entered up into the positions occupied by the Kwoki from 1903 to 1910 in order to be circumcised, becoming brothers with the Kiptala became officially men. So every fifteen years or so the whole machine moves like a carrier wheel running one cog, and every set goes through the following periods:

[illegible]	[illegible]
[illegible]	[illegible]
[illegible]	[illegible]
[illegible]	[illegible]
[illegible]	[illegible]
[illegible]	[illegible]
[illegible]	[illegible]
[illegible]	[illegible]

[illegible]

[illegible]

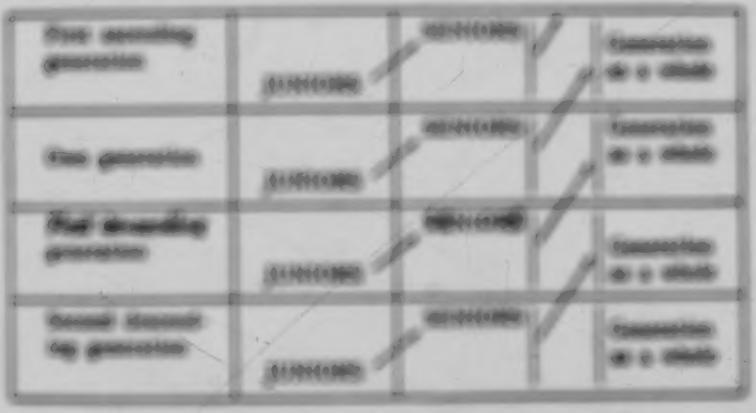
[illegible]



[illegible]

are brothers to each other and equally living of the same generation. So too are the sons of the father's brother, also Ergates and Kinnaird, who are equivalent to Ego. And Ego's wife is circumstanced as the same time as the brother's and the daughter's, since the other brothers's and daughter's are too young to be circumstanced. 5 and 11 will therefore belong to junior agnatic and affinal Ego's, 6, and 7 have been circumcised and are allowed to marry and indulge in other male pursuits; 8 and 9 will still have the inferior status of earth on knee and be subordinate to their brothers as regards behaviour and social position.

Each generation is therefore liable to be modified in two layers corresponding two age-sets which run across the relationship system, and where the kinship behaviour patterns overlap with those of the age-sets, the latter will prevail. Both sets in Ego's generation, for instance, will behave in the same way to father, father's brother, and father's father; but 5 and 9 cannot behave to Ego as 6 behaves to Ego, because they are merely born after his and cannot be equals, while Ego and 6 are twins. Similarly, in the two descending generation all will behave in the same way to Ego's generation, that is and 11 mean give to 5, 6, and 7 the respect that 5, 6, and 7 do not give to each other or to 8 and 9. And the principle is the same with the second descending generation.



The effect of the age-set on behaviour is to strengthen the traditional role of behaviour by emphasizing the respects between patient and partner.

Age-sets also affect hospitality, for while an Hundsi would normally refuse to receive one of his own kinds, the degree of hospitality and of the intimacy to which he is admitted vary according to whether the visitor is an age-mate or not. If he is of the same age-set as the host (or marries other host supportive equipment may be), he will sleep along with the host and his wife, brought his wife out to groom the host's wife to sleep with and among the friends. But if he belongs to a different age-set, his wife will

a man by classificatory all the children on his father's side are brothers, while those on the mother's side are both cousins and brothers, and a man's own children are sons, while those of his sister are nieces. When the children are small these differences are scarcely marked and not apparent; but as they grow older a distinction tends to grow between those on the father's side and those on the mother's side, especially between brothers and sisters, and this is emphasized by the possibility that a man might marry his brother's sister's daughter's daughter, even if he seldom if ever does so in fact.

Between a man and his second descending generation there is a rule of avoidance, but consanguineally his grandchildren are regarded with the greatest love. In practice, however, this generation counts as far as the

[illegible] terms and other intangible elements, because of their suitability, fitted into the existing culture patterns and were then voluntarily adopted. The Fuedi, not being fire-experts, were the best fitted hunters; not being hunters, they made fans; the Tswidis being both fire-keepers and hunters can supply the Fuedi with what they want, and in return get from the Fuedi things which they cannot produce. The satisfaction of these desires has undoubtedly helped to the assimilation of Fuedi culture in the Tswidis, and it has also preserved the continuity of friendly relations between the two peoples.

When I first met the Tswidis in 1927 they were virtually as they had been in pre-European days: a purely hunting people with a basically non-Fuedi organization heavily overlaid and modified by Fuedi influence, yet distinct in outlook and way of life — so distinct in fact that having taken to agriculture and cattle simultaneously, they have not acquired the cattle complex of the pastoralists and retain the outlook of the hunter.

2. The Clan and its Place in Public Life

The life of the Tswidis is controlled by two institutions: the clan and its council, and the town council. The clan council may be described as a primary institution working within the framework of the town organization. The Tswidis are not a "tribe" like the Fuedi, and the clan-system does not strengthen tribal solidarity, but it does strengthen and maintain family unity by bringing together elements from the whole area to deal with clan affairs. The clan council deals with matters which concern members of the clan; the town council is more political and less domestic, regarding the Canton as a whole irrespective of clan.

Of influence and binding are the facts of social life. The clan is the basis of family-cohesion and government; and it is in regard to the importance attached to the clan that Tswidis social organization differs fundamentally from that of the Fuedi. To the latter, the clan is in practice little more than a means of regulating marriage, and a traditional form of tribal division (though it has actually a deeper but less easily defined significance); but to the Tswidis the regulation of public life as a whole depends upon the clan, and its social importance is emphasized by the habit of living in clan settlements, by the clan councils, and by the strong bias on the group-aspect rather than on the kinship-aspect of the clan. Moreover, clan-solidarity evades the town boundaries, and is the main factor that keeps the bands together under conditions which would easily overthrow any institution less strong.

The social aspect of the clan has been described in a previous paper[1], and this aspect need not therefore be touched upon here. Enough that to live in clan settlements, and therefore the institution of a clan council is both natural and easily maintained. The clan council consists of all the adult men of the clan, that is, the men of the age-sets senior to the age of the youngest who are recognized to be fighting men of the Fuedi. Though in practice it has become customary for anyone who has been circumcised to attend the council

Social Organization.—The Yoko-Yoko Woodworkers are very few in number, and are divided among three exogamous moieties, each of which has its own totemic animal (the Rhino, who has no subspecies on this planet).—

[illegible]	[illegible]	[illegible]
[illegible]	[illegible]	[illegible]

Each moiety lives in a single village of its own, similar in structure to that already described. The moieties are not intimate, but they are exogamous, and descent is in the male line. The [illegible] who has told me most, who lives at Kokonga (north of Kuwaroa), Ochtoloshka's hereditary, and he relates it not unconnected to which the powers of a chief. The Chiefs and the Lawmen [illegible] are each presided over by a headman (panchayatdhar).

Birth.—When a child is born the mother is isolated by female relatives. There are no [illegible] taboos, as among the Ipkhara. The Woodworkers allege that there are no special [illegible] connected with birth. Should a child cross but forward into the world by cell to belly throughout life. It is stated that the afterbirth is thrown away with the soiled. After creating, a child accepts the father's hair, if a boy, and her mother's if a girl.

Betrothal and Marriage.—The rules for betrothal seem to be very similar to those existing among the Ipkhara, except that the propositions (betrothal gave to the girl's people direct, without representation to the Sub-Lawmen. The consent of the girl and of the parents or both sides is necessary, and the number of gifts is not specified, as it is among the Ipkhara.

Marriage is celebrated by a feast to which the people of the two moieties to which the [illegible] belong take part. There is no taboo practice to the marriage feast. After marriage a man lives for two days and nights in the hut of his betrothed, after which the woman [illegible] with him to his own village. Here to occupy a new hut already built for the newly married [illegible] by the male parties, after he has established the relation with regard to the Ipkhara does [illegible] the wedding is.

Burial.—All the dead are buried without special ceremony.[1] There is no special burial ground, but graves are dug [illegible] and in the bush,[1] well away from the village.

Age Classes.—These appear to be quite unknown.

Crime and Punishment.—The chief offence is adultery. This, however, is a private affair, and is dealt with privately, for it is not a sin against the community. A woman who is guilty in respect of this is cast out by her husband, who sends the offending man with a view to slaying him. Murder is, however, a tribal affair, for which the punishment is death. The Ipkhara practice in this respect is not followed.

[1] The statement was subsequently contradicted, & so far as it was correct that the corpse remains at all events.

/top cont'd/

Succession is patrilineal and marriage patrilocal. Polygyny is practiced. The lineage is a functional continuum, including ancestral spirits as active members while they are still remembered by the persons responsible (so to speak) for keeping them alive by acts of memory and communion, the continuum being of the perpetually successive rather than of the periodically recurrent type, that is to say, a boy is his father's second self rather than his grandfather or great-grandfather born again.

Initiation includes a circumcision rite for boys and a pre-marital rite of clitoridectomy for girls. Age-grading is based on male initiation. There are no generation-ages except in so far as the Dorobo imitated or joined in the iruiko of the Kikuyu and the emuoto of the Masai. The word they use for the handing-over ceremony is [illegible]. Alternating ages or generations are distinguished as omet ap-tai (the right hand) and omet ap-katap (the left hand). When the Kikuyu system is referred to Mwangi is the former and Maina the latter, but the expressions were probably used originally of the Masai right-hand and left-hand circumcision groups.

There are no indigenous chiefs, the judiciary and legislature being a council of elders. Such an elder is called kiruogindet (pl. iruogik). A kiruogindet has much the same function as a Kikuyu muthamaki. There is no laibon but formerly the Dorobo owed allegiance to the laibon of the Masai.

They recognize one supreme being, called Tururo (compare the Sun Tororut). There appears to be no cult of so-called Sun Worship. The sacred trees, used for prayers to Tururo, are, for rain the kaitibon (a solitary clump), for honey the muswa, and, in connection with circumcision ceremonies, the muthai and the mukarangara.

7b. Little or nothing is known of the relationship of the Dorobo of Southern Kikuyu with other Dorobo sections. The "Dorobo Commission" called them the Kikuyu Escarpment group, and remarked that they were first found in the Aberdares but left there and went to the Masai Reserve, whence they were ejected. At the time the Commission met this group was living as forest squatters in the

14.Huntingford E-4 (1939-1939)[36]
FLA Dorobo File

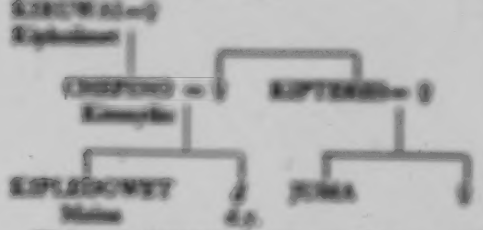
[P.184, B]

The social structure of the Dorobo is based on clan-solidarity, the clans being patrilineal, partially patrilocal, and exogamous. The clan-names, as well as the age-set names, and many of the relationship terms, are of Nandi origin; but here the resemblance ends, and it is seen that the social structure is unlike that of the Nandi. The whole life and outlook of the people is, in fact, dissimilar. There is no doubt that living in and in close contact with a forest produces a considerable effect on people, which differentiates them from those who live in open country; and the influence of the forest is felt particularly by the children. Peculiar factors of forest life, which obviously cannot occur in open country, are:

1. The homestead is set in a small clearing just large enough to hold two or three huts.

2. The continual presence of large trees, inescapable when the children are young.

and education of children may be grouped according to the amount of influence they exert, and as primary collection are to be included: 0., M., F.Br., F.Br.W., F.Z., F.M; as secondary collection, M.Br., M.Br.W., F.Sis., F.Sis.H., M.Sis., M.Sis.H., and eldermith (relations) to the parents of elsewhere living in the group. The M.Br. does not occupy the same place with regard to a child that he does in Nandi. He does not live in the same group, whereas the F.Br. frequently does, and so the F.Br. has the greater influence on the child. Many Dorobo, in fact, have had little or nothing to do with their M.Br., and some do not even know their names. In the following Kalenjin genealogy,



Kipkoyeyet had hardly ever seen Kipsoro, and could not even remember his name, till another person told him. Juma similarly did not know the name of his M.Br.

The relationship system of the Dorobo thus differs from the Nandi, especially in the following:

(1) Children of F.Br. and F.Sis. are classed as *MACHOEGAB*.

(2) Children of M.Sis. are classed with Br. and Sis. as *KEIENDA*.

(3) Children of age and his Br. are classed as *APAA*.

(4) Children of M.Br. and age's Sis. are classed as *MAMA*.

(5) Children in the 2nd descending generation are *AGWI*.

(6) The F.Sr. takes the place of M.Br.

B. Age-sets and behaviour patterns.

The Dorobo have seven age-sets, *ipinde*, pl. *ipinguik*, with three age-grades in each set. These sets are borrowed from the Nandi, and have the same 15-year intervals, and the same three sub-divisions.

The age-grades through which a person passes [illegible] in turn are:

♂	♀
gaidi: uncircumcised boys.	*Ngadi*: girls.
Mwendi: circumcised men.	*Mwendi*: married women.
Kpadondi: elders.	*Ngadingadondi*: old women.

Boys are *gaidi* till circumcised, when they become *mwendi* for the 15-year period of their age-set and then *kpadondi* when the change over occurs. The sub-divisions, *mwendi*, of the Dondo age-sets—each set has the same—sub-divisions are called:

Senior: *Chepondi*.
Middle: *Ngandi* or *Kpadingadi*.
Junior: *Mwendi* or *Kpandondi*.

A man belongs normally to the age-set but one below that of his father, i.e.:

Age-set:	Sisters are usually born to:	Younger women may belong to:
Kpadondi	*Kpandondi*	*Ngandi*
Kpadondi	*Ngandi*	*Mwendi*
Kpandondi	*Mwendi*	*Gaidi*
Ngandi	*Gaidi*	*Gaidi*
Mwendi	*Gaidi*	*Kpadondi*
Gaidi	*Kpadondi*	*Kpadondi*
Gaidi	*Kpadondi*	*Kpandondi*

It may happen, as in Mendi, that a man will be [illegible] classed with an age-set but two below that of his father (as in the last column above), because he was born so long after his father's marriage that he would be too young to be circumcised with the age he would normally belong to.

With these terminological features, the classificatory elements of the Dondo age-sets to the Mendi ends. They have no military functions at all, and their [illegible] sole significance is behavioristic. As an element in social structure the age-sets cut across the [illegible] formal kinship patterns, and behaviour is not [illegible] wholly reflected in the kinship system; where the two elements clash, the age-set pattern prevails. In a short summary it is not possible to go into details, but the following genealogy will illustrate it sufficiently:

* See J.R.A.I. lxii. 491, for further details of the Mendi age-set.

(The bottom line shows the age-sets to which the sons of the 3rd Son would normally belong.)

[illegible]

[illegible]

Although by relationship all these kinsfolk are theoretically equals, or living brothers, yet by reason of their age-grouping different age-sets are found in all these families, with the result that Eldests and Eighths are usually kinsfolk to their kinsfolk Eighths, Sixths, and Eighths, Eighths; while Lasts, Eighths, and Eighths are all kinsfolk to Lasts. So long as they were small this did not matter, but when they reached puberty, the inferiority of their status became noticeable in such things as invitations from all sexual matters, and is reflected in the general idea that "it is not so to only a child, and he must not expect to do the grown-up things that we are allowed to do." The same will apply to the next generation.

The general principles of Dravidic kinsfolk may be summarized thus (from the standpoint of "ego"):

To the 3rd and 2nd ascending generations: care and respect.

To the 1st ascending generation: respect, obedience (and care when old). Easy and familiar intercourse, but no knowledge of bad language.

To the own generation: considerable latitude is allowed between members of the own generation: obscene talk and jests, discussion of sexual matters and so forth are tolerated, though of course such talk must not become vile. The idea of mutual help and support, which is extended by all to their parents and grandparents (when these are still alive) is more emphasized in the interrelations of those of the own generation.

To the 1st descending generation: all members of this are treated much as ego treats his own children (and this applies more or less to the 2nd descending generation). In this category are also included those members of ego's own generation, e.g. younger brothers, who belong to a junior age-set.

To affinals: wife's mother must be avoided, both before and not, and must not be spoken to; if met on a road, a man must get off the the road out of her sight. The wife's father need not be avoided, and
